INDEX

AACH, Dr. H. G.: A Difference between the Sub-Units of Tobacco Mosaic Virus Protein?, 75
Abbie, Prof. A. A.: Doctor Ruggles Gates and the Aboriginal Australian, 375
Abe, Takahiro: Interaction of Picric Acid with Sodium Hydroxide in Water, 234
Abercrombie, Dr. M. L. Johnson: The Anatomy of Judgment, *review* by Prof. O. L. Zangwill, 817
Ability to excrete Beetroot Pigment (Betanin): Race Differences in the (Dr. P. H. Saldanha, L. E. Magalhaes and Wanda A. Horta), 806
Ablation (Stepwise), and Heat Transfer in Cold-Cathode Arcs (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Abnormal Crimping in Merino and Polwarth Wools (R. E. Chapman, B. F. Short and P. G. Hyland), 960
Abnormal Serum Protein in Experimental Poisoning by Cadmium and other Metals (D. J. Lawford), 946
'Abominable Snowman': Problem of the (S. V. Obruchev), 558
Aboriginal Australian: Doctor Ruggles Gates and the (Prof. A. A. Abbie), 375
Aborigine (Central Australian): Haematology of the (J. R. Casey-Smith), 903
Aboul-Ela, I. A.: Conditioning *Ostrea edulis* L. from Limfjord for Reproduction Out of Season (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 25), *review* by Dr. A. J. Southward, 360
Abramson, Harold A. (edited by): Neuropharmacology—Transactions of the Fourth Conference, Princeton, 1957, *review* by Dr. D. H. Brinton, 447
Abroad (Science): The Royal Society and the Progress of (Prof. R. J. Forbes), 100
Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin (Hanna Engelberg and Dr. M. Artman), 801
Absence of Local Cytotoxic Change in Man from Griseofulvin (Prof. Leon Goldman, Amanda Beyer and Jan Schwarz), 335
Absorbance of Feulgen-stained Somatic Cell Nuclei (Dr. Simon Iversen), 86
Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Absorption (Atomic): Determination of Nickel and Cobalt by (J. E. Allan), 1110
Absorption (Atomic) Spectrophotometric Determination of Molybdenum and Strontium (D. J. David), 1109
Absorption (Intestinal), of Glycose, Methionine and Sodium Butyrate: Reduction of the, by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
Absorption (Pure Rotational), of Ozone in the Region 125-500 Microns (Dr. H. A. Gebbie, N. W. B. Stone and C. D. Walshaw), 765
Absorption-Elution Grouping of Dried Blood-stains on Fabrics (S. S. Kind), 789
Absorption Spectra (Electronic), and Chemical Reactivity with Mercaptalbumin: An Ortho Effect influencing Fungitoxicity, (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Absorption Spectra (Ultra-violet), of the Diazines (Prof. K. Keith Innes, James A. Merritt, Wayne C. Tincher and Shelby G. Tilford), 500
Absorption Spectra (Ultra-Violet), of the Molecules H_2O, HDO and D_2O (Dr. Jack Barrett and Dr. A. L. Mansell), 138; (R. M. Golding), 139
Absorption Spectra (Ultra-violet), of Proteins in Deuterium Oxide (Dr. Shiro Takashima), 597
Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Abstracts: Nuclear Engineering, Vol. 1, No. 1, 993
Abundance of Marine Plankton (R. M. Cassie), 289
Accelerator Conference: Second (High Voltage Engineering Corporation), 743
Accelerators (Electron Linear): Pulse-shortening in (M. G. Kelliher and R. Beadle), 1099
Accessory Glands of Gene's Organ in Ticks (Dr. B. Feldman-Muhsam and Y. Havivi), 964
Accident (Reactor), at Windscale in October 1957. The Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Accidents in Mines and Quarries, 1076
Accidents (Road), during Christmas 1959 (Road Research Laboratory, Technical Paper No. 49), 1000
Acetabularia mediterranea: Influence of Localized Ultra-violet Irradiation on the Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in (Prof. J. Brachet and Dr. J. M. Olszewska), 954
Acetate into Protein: Incorporation of, by Obligately Parasitic and Saprophytic Fungi (Dr. Richard C. Staples and Dr. H. P. Burchfield), 1040
Acetates (Trinuclear Basic): Structure of the (Dr. L. E. Orgel), 504
Acetobacter acetigenum: Biosynthesis of Cellulose by (Dr. A. M. Brown and Dr. J. A. Gascoigne), 1010
  Syntheses of Glucose, Cellobiose and other Saccharides by, in a Lactate-buffered Glycerol Medium (Dr. C. P. Jackson and K. Ramamurti), 942
Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and Bone Marrow Cells (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Acetylcholine with Physiological Stimulus: Summative Action of, on the Generator Potential in the Lateral Eye of the Horseshoe Crab (R. Kikuchi, K. Naito and S. Minagawa), 1118
Acetylcholine Concentration in the Brain of the Rat: Strain Differences in (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Acetyl-chymotrypsin: Structures of some Acetyl-serine Peptides from (Leo Benoiton, Prof. H. N. Rydon, R. A. Oosterbaan, M. E. Van Adrichem and Prof. J. A. Cohen), 596
Acetyl-serine Peptides: Structures of some, from Acetyl-chymotrypsin (Leo Benoiton, Prof. H. N. Rydon, R. A. Oosterbaan, M. E. Van Adrichem and Prof. J. A. Cohen), 596
Achievement—some Contributions of Animal Experiment to the Conquest of Disease (Dr. Geoffrey Lapage), *review* by Dr. W. Lane-Petter, 977
Acid Phosphatase: A Simple Azo-Dye Method for Histochemical Demonstration of (Dr. Tibor Barka), 248
Acid Phosphatase (Rat Serum): Total and *l*(+) Tartaric Acid Inhibited (Dr. Z. Laron and B. Epstein Halberstadt), 67
Acid-etched Glass Rods: Strengths of (B. A. Proctor), 492
Acid-tolerant and Non-sporulating Yeast from Passion Fruit Juice (B. A. S. Rao and J. S. Pruthi), 342
Acridine Orange: Effect of, on Living Bull Spermatozoa (C. van Duijn, jun.), 1006
  Induced Fluorescence with, after Osmium Fixation (W. J. Randles), 964
Acrylate (Methyl): Generation of Aerosols by Vapour-Phase Polymerization of (R. Pearson and G. Langer), 235
Actinomycin: Action of Nucleic Acids on the Inhibition of Growth by, of *Neurospora crassa* (Dr. W. Kersten, Dr. H. Kersten and Prof. H. M. Rauen), 60
  Interaction of, with Deoxyribonucleic Acid (Prof. J. Kawamata and M. Imanishi), 1112
Action of Micrococcal Phosphodiesterase: Mode of (Dr. K. K. Reddi), 74
Action of Nucleic Acids on the Inhibition of Growth by Actinomycin of *Neurospora crassa* (Dr. W. Kersten, Dr. H. Kersten and Prof. H. M. Rauen), 60
Action of Soluble Matrix Antifouling Compositions: Mode of (A. Partington), 1105
Action of some Surface-Active Compounds on the Gastro-intestinal Mucosa (Dr. J. A. Nissim), 305
Action of Tetrakis (Hydroxymethyl) Phosphonium Chloride on Wool (L. S. Bajpai, Prof. C. S. Whewell and J. M. Woodhouse), 602
Action (Anti-Fertility), of a Monoamine Oxidase Inhibitor (W. G. Spector), 514
Action (Direct), on Metabolism: Polypeptides of the Human Pituitary with (Dr. J. Bornstein and Deirdre Hyde), 125
Action (Lipaemic Clearing), of Artificial Anticoagulants (Dr. E. P. George, Dr. G. V. Hall and Dr. G. S. Farkas), 782
Action (Physiological), of Rotenone: Mechanism of the (Prof. P. E. Lindahl and K. E. Öberg), 784
Action (Summative), of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the Horseshoe Crab (R. Kikuchi, K. Naito and S. Minagawa), 1118
Action (Sustained), of Injected Chelating Agents (Dr. A. Lindenbaum and Dr. J. Schubert), 575
Action (Synergetic), of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), *erratum*, 559
Activation: Energies of, for Self-diffusion of Alkali Metal Ions in Analcite (Prof. R. M. Barrer and L. V. C. Rees), 768
Activation of One Plant Virus by Another (B. Kassanis and H. L. Nixon), 713
Activation (Enzymatic), of a Hormone-like Response in *Hydra* by Proteases (Dr. Howard M. Lenhoff and John Bovaird), 671
Activation (Neutron): Non-destructive Analysis of Selenium by, followed by Gamma-Ray Spectrometry (Dr. Minoru Okada), 594
Active against Gram-positive Bacteria: An Antibiotic Complex derived from a *Streptomyces* and (B. Sgarzi, A. M. Lugli and G. Giolitti), 1029
Active Adsorbents: Solid-Solid Interactions on (Dr. Phillip Anthony and Prof. Harry Zeitlin), 936
Active Cellular Fractions: Homotransplant Antigens—Preparation of (L. T. Mann, jun., J. M. Corson and Prof. G. J. Dammin), 774
Active Forms (Optically), of a Derivative of Tetra-substituted Sulphur (M. Baresh), 591
Active Fragments (Immunologically); Presence of, after Proteolytic Degradation of Human γ-Globulin (L. A. Hanson and B. G. Johansson), 599
Active Substance (Pharmacologically): An Unidentified, extracted from Cerebral Hemispheres (P. F. L. Andrews, Shirley A. P. Price and Dr. G. B. West), 420
Activities (Scientific), at Halley Bay: Recent—International Geophysical Co-operation, 1959 (M. J. Blackwell), 982
Activity: Plant Hormone—Stilboestrol applied to the Wheat Seedling (Dr. J. J. C. Hinton and Dr. T. Moran), 258
Activity of Bovine Pancreatic Ribonuclease A in Mixed Solvent Systems (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Activity (Alpha), of certain Botanical Materials (Prof. W. V. Mayneord, R. C. Turner and J. M. Radley), 208
Activity (Anti-Inflammatory), of Salicylate (Dr. V. Marks and Dr. M. J. H. Smith), 610
Activity (Antileukaemic), of Glycyrrhetinic Acid (Dr. W. Logemann, F. Lauria, G. Cudkowicz and J. Franceschini), 607
Activity (Anti-neoplastic), of Tetrahydro-1,3-oxazine Derivatives (Prof. T. Urbański, D. Gurne, S. Slopek, H. Mordarska and M. Mordarski), 426
Activity (Anti-Pneumococcus Type XIV), of Precipitins from *Ricinus communis* Seeds (Lieut.-Col. G. W. G. Bird), 415
Activity (Catalase-like), in Lactic Acid Bacteria: Two Types of (R. Whittenbury), 433, *erratum*, 466
Activity (Depressing), of Meprobamate on the Reticulo-Endothelial System (Prof. A. Del Vecchio and L. Bolis), 513

Activity (Diuretic), of 2-Amino-4-metachloro-anilino-1,3,5,triazine (*R*-37), (D. J. Mehta, Prof. U. K. Sheth and Dr. C. V. Delwala), 1034
Activity (Esterase), during Intracellular Digestion in a Histophagous Ciliate : Increase of (Dr. Miklós Muller, József Tóth and Prof Imre Toro), 65
Activity (The β-D-Fucosidase), of Mammalian Tissues and its relation to other Glycosidases (Dr. G. A. Levvy), 1027
Activity (Mutagenic), of Formaldehyde : Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the Mediation of the (Dr. Thomas Alderson), 485
Activity (Nerve) : Chemical and Molecular Basis of (David Nachmansohn), *review* by Dr D. H Brinton, 447
Activity (Phagocytic), of the Reticulo-Endothelial System : Effect of some Aromatic Hydroxy Compounds on the (Prof. T. Nicol, C. Druce and C. C Ware), 422
  Effect of Three Compounds related by Diethylstilboestrol on the (Prof T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
Activity (Plant-Growth), of α-Alkylphenylacetic Acids and 1,2-Benzo-1-*cyclo*-alkene-3-carboxylic Acids (Kazuyoshi Kawazu, Toshio Fujita, Tetsuo Mitsui, Juro Kato and Masayuki Katsumi), 694
Activity (Polyphenol Oxidase), of *Nicotiana glutinosa* Leaves infected with Tobacco Mosaic Virus (Dr. Masatake Kikuchi and Akira Yamaguchi), 1048
Activity (Proactivator) : Isolation of Material with, from Human Serum (H B. W. Greig and Elsie M. Cornelius), 1125
Acuity (Visual) Effect of Size of Pupil on (Dr. F. W. Campbell and Dr. A. H. Gregory), 1121
Acute Leukaemia Cells . Proliferative Capacity of (Dr. Felice Gavosto, Giovanni Maraini and Alessandro Pileri), 611
β-Acylacrylic Acids . Structure of (Prof. Nils Hellstrom), 146, *erratum*, 650
Adams, F. R., and others : Preliminary Psychomotor Stress Studies with Subnormal Psychopathic Subjects, 172
Adams, J B. . Awarded the Roentgen Prize of the Justus Liebig University of Giessen, 201
Adaptive Chain in the Conversion of Antimetabolites into Metabolites (Dr. K. I. Markov, Dr. G. K. Saev and Dr. E. V. Golovinsky), 1041
1:1-Adducts of Cupric β-Diketone Chelates with Heterocyclic Bases · Structure of the (Dr. D. P. Graddon and E C. Watton), 1021
Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea* : Influence of Localized Ultra-violet Irradiation on the Incorporation of (Prof. J. Brachet and Dr. J. M. Olszewska), 954
Adenosine Diphosphate : Synthesis of, by the Oxidation of Quinol Phosphates (Oxidative Phosphorylation) (Dr. V. M. Clark, D. W. Hutchinson and Sir Alexander Todd), 59
Adenosine Triphosphate and Maintenance of Shape of the Human Red Cells (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Adenovirus Nucleic Acid : Site and Nature of (Dr. M. A. Epstein and Dr. S. J. Holt), 1050
Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde : Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of (Dr Thomas Alderson), 485
Administration · Scientist and Technologist in, 353
Administration of Materials Research and Development for National Security : More Effective Organization and (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Adrenal Cortex : Specific Inhibitors of the (Prof. J. H U. Brown), 985
Adrenal Glands of Litter-mate Cats : Proportion of Noradrenaline to Adrenaline in the (Dr. K. R. Butterworth and Dr. Monica Mann), 785
Adrenal Medulla (Denervated), of the Rat : Effect of Reserpine on the Nucleotide and Catecholamine Content of the (Prof. Nils-Åke Hillarp), 1032
Adrenaline : Proportion of Noradrenaline to, in the Adrenal Glands of Litter-mate Cats (Dr. K. R. Butterworth and Dr. Monica Mann), 785
Adrenergic Mechanisms : Parallelism of Changes produced by Cooling and by Drugs known to affect (Prof Eleanor Zaimis), 213
Adsorbents (Active) : Solid–Solid Interactions on (Dr. Philip Anthony and Prof. Harry Zeitlin), 936
Adsorption and Electrodekinetic Parameters at Metal Surfaces : Simultaneous Measurement of (A. M. Peers), 503 ; (Dr. E. A. Blomgren and Dr. J O'M. Bockris), 504
Adult Education, Universities Council for : Report on the Year 1958-1959, 906
Adult Spleen Cells (Homologous), injected into New-born Mice : Fate of (A. J. S. Davies and Sheila M. A. Doak), 610
Advanced Technology, Northampton College of (London) : Advanced Course on Direction and Supervision of Scientific and Engineering Personnel, 905
Advances in Chemical Physics (edited by Prof. I. Prigogine), Vols. 1 and 2, *review* by Prof. C. A. Coulson, 812
Advances in Clinical Chemistry (edited by Harry Sobotka and C. P. Stewart), Vol. 2, *review* by Dr. R. Consden, 890
Advances in Geophysics (edited by H. E. Landsberg and Prof. J. van Mieghem), Vols. 4 and 5, *review* by Dr. S. H. Hall, 1060
Advances in Steroid Chemistry : Recent (Kingston Technical College Postgraduate Course on), 905
Advances in Veterinary Science (edited by C. A. Brandly and E. L. Jungherr), Vol. 5, *review* by Prof. H Burrow, 448
Adventures with the Missing Link (Prof. Raymond A. Dart, with Dennis Craig), *review* by Sonia Cole, 888
Advisory Committee on Nuclear Safety : Appointment of an, 113
Advisory Council for Education (Central)—England : Report, Vol. 2, Surveys, 883
Advisory Council for Research and Development in Fuel and Power, 286
Advisory Group for Aeronautical Research and Development—*see under* AGARD
Advisory Water Committee, Central · Second Report of the Sub-Committee on Growing Demand for Water, 198
Aedes aegypti (L), the Yellow Fever Mosquito—its Life History, Bionomics and Structure (Sir S. Rickard Christophers), *review* by Prof. V. B Wigglesworth, 813
Aerobic Glycolysis : Inhibition of, in Yoshida Ascites Hepatoma by Tartronic Acid (Dr. L. Fiume), 792
Aeronautical Research and Development, Advisory Group for—*see under* AGARD
Aerosols : Generation of, by Vapour-Phase Polymerization of Methyl Acrylate (R. Pearson and G. Langer), 235
  The Physical Chemistry of (Faraday Society General Discussion on), 201
Africa South of the Sahara : Science and Technology in, 198
Africa's Place in the Emergence of Civilization (Prof. Raymond A Dart), *review* by M. C. Burkitt, 891
Africa (East) : Scientific Research in, 206
Africa (East) High Commission . Annual Report for 1959, 206
  Annual Report for 1959 of the East African Fisheries Research Organization, 469
Africa (Northern) : The Stone Age in (Dr. C. B. M. McBurney), *review* by M. C. Burkitt, 1062
Africa (South) . Polychaete Fauna of (Prof. J. H. Day), Part 5, 199
African (East) Fisheries Research Organization : Annual Report 1959 (East Africa High Commission), 469
African (East) Virus Research Institute : Report for 1958-59 (J. D. Gillett), 565
African (North) Prehistory, *review* by M. C. Burkitt, 1062
African (South) Animal Life—Results of the Lund University Expedition in 1950-1951, Vol. 6 (edited by Bertil Hanstrom, Per Brinck and Gustav Rudebeck), *review* by H. Oldroyd, 1063
African (South) Bantu The Rh Factor C in (Dr. A. Zoutendyk and Dr. H. Teodorczuk), 790
African (South) Broadcasting Corporation : Van Riebeeck Lectures, Africa's Place in the Emergence of Civilization (Prof. Raymond A. Dart), *review* by M C Burkitt, 891
African (South) Museum : *Annals of the*, Vol. 45, Part 3, 199
African (South) University Students : Daily Food Consumption by (Sonia E. Walker), 381
African (West) Religion : Oedipus and Job in (Prof. Meyer Fortes), *review* by Michael Argyle, 96
AGARD : Fourth Colloquium on Combustion and Propulsion (High Mach Number Air-breathing Engines), 18
  Meetings for the second half of 1960, 116
  Sixteenth Meeting of the Aero Space Medical Panel, 994
  Avionics Panel Symposium on Radio Navigation, 1079
Age : Chemical Physics Comes of, *review* by Prof. C. A. Coulson, 812
Age of the Base of the Cambrian (Dr. G. W. Wetherill), 34 ; (Prof. Arthur Holmes), 35
Age of the Cambrian System (Prof. C. F. Davidson), 1020
Age (Known) : Marked Humpback Whale of (Dr. R. G. Chittleborough), 164
Age (Scientific) : The Spiritual Crisis of the (G. D. Yarnold), *review* by R. Brightman, 818
Age (The Stone), in Northern Africa (Dr. C. B. M. McBurney), *review* by M. C Burkitt, 1062
Age Determination of Seals (H. R. Hewer), 959
Ageing Bloodstains : Use of Reflectance Measurements in assessing the Colour Changes of (Dr. D. Patterson), 688
Ageing of Mitochondria (Dr C. H. Gallagher), 162
Ageing and Radiation (Dr. G. J. Neary), 10
Agents (Surface-active) : Treatment of *Leishmania donovani* Infections with (Dr. J. D. Fulton), 1129
Ager, Dr D. V. : Appointed reader in geology at the Imperial College of Science and Technology, London, 117
Ageron, Paul (Alami, Richard, etc) . Évacuation et Récupération de la Chaleur des Réacteurs Nucléaires, *review* by R. J. Syme, 636
Ages (Potassium–Argon), of some Rocks from the South Atlantic (John A. Miller), 1019
Aggregate : Dependence of Cement-Aggregate Bond-Strength on Size of (K. M Alexander and J. Wardlaw), 230
Aggregate (Cement-) Bond-Strength : Dependence of, on Size of Aggregate (K. M. Alexander and J. Wardlaw), 230
Agricultural Advisory Service (National) : Appointment of V. Cory as county advisory officer for Yorkshire (West Riding), 1079
Agricultural Land : The Deposition of Strontium-89 and Strontium-90 on, and their Entry into Milk after the Reactor Accident at Windscale in October 1957 (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Agricultural Pests : Chemical Control of, and Conservation of America's Wild-Life (United States National Academy of Sciences—National Research Council Committee on), 114
Agricultural Policy (British) : Principles for—a Study sponsored by the Nuffield Foundation (edited by H. T. Williams), *review* by Sir John Russell, 721
Agricultural Research Council : Appointment of Prof. Alexander Robertson as a member, 290
Agricultural Research Council (United Kingdom Atomic Energy Authority and the) : Joint Report on the Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the Reactor Accident at Windscale in October 1957, 1077
Agricultural Science : Proceedings of the University of Nottingham Sixth Easter School in (1959)—The Measurement of Grassland Productivity (edited by Prof. J. D Ivins), *review* by Dr. G. W. Cooke, 544
Agricultural University : India's First, 556
Agricultural and Food Attaché (United Kingdom), in Argentina, 1075
Agricultural and Scientific Research Overseas, 556
Agriculture . Weather Problems in (Royal Meteorological Society Summer Meeting), 995
Agriculture, United States Department of : Supplements 9 and 10 to the Index-Catalogue of Medical and Veterinary Zoology, 559
Agriculture (British) : Future of, *review* by Sir John Russell, 721
Agriculture, Fisheries and Food, Ministry of : Technical Bulletin No. 10, Control of Rats in Sewers (Dr. E. W. Bentley), 288
  Fishery Investigations, Series 2, Vol. 22, No. 9, Echo Sounding Experiments in the Barents Sea (I. D. Richardson, D. H. Cushing, F. R. Harden Jones, R. J. H. Beverton and R. W. Blacker), 855
  Bulletin No. 34, Mushroom Growing, seventh edition, 902
Agriculture and Food Storage : Use of Toxic Chemicals in (Request from the Research Study Group for evidence), 290
Agriculture (Tropical), Imperial College of : To be merged into the University College of the West Indies, 374
Agrobacterium tumefaciens : A Vacuolar System in Cells of, as shown by Electron Microscopy of Ultra-thin Sections (Miguel Rubio-Huertos and Paul R. Desjardins), 1043

Ahrens, Jun., Dr. Edward H. : Promoted to a professor and member of the Rockefeller Institute, 290
Ahrens, Prof. L. H., and others (edited by) : Physics and Chemistry of the Earth, Vol. 3, *review* by B. E. Leake, 544
Aid when Operating on Marine Gastropoda : 'Water Rigour' as an (Prof. B. J. Krijgsman and A. C. Brown), 69
Aigrain, Prof. P., et Englert, F. : Les Conducteurs, *review* by Dr. J. R. Tillman, 1058
Ainsworth, Dr. G. C. : Microbial Systematics, 191
  Plant Pathology in the British Commonwealth, 834
Air : Average Water Vapour Content of the (J. K. Bannon and L. P. Steele), 748
Air (Clean), National Society for : Year Book for 1960, 200
Air Force Cambridge Research Center (Geophysics Research Directorate of the United States), with the co-operation of Lowell Technological Institute Research Foundation : Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959 (edited by William G. Chace and Howard K. Moore), *review* by Dr. B. A. Thrush, 726
Air Ministry (Meteorological Office) : Geophysical Memoirs No. 102, Average Water Vapour Content of the Air (J. K. Bannon and L. P. Steele), 748
  Scientific Paper No. 1, Airborne Measurements of Latitudinal Variation of Frost-point Temperature and Wind (N. C. Helliwell), 993
Air-borne Material : Radioactive Labelling of Membrane Filters for the Assay of (Dr. G. Kubie and Dr. K. Spurny), 930
Airborne Measurements of Latitudinal Variation of Frost-point Temperature and Wind (N. C. Helliwell), 993
Airborne *Serratia marcescens* : Delayed Recovery of, after Short-Time Exposure to Ultra-violet Irradiation (Dr. R. L. Dimmick), 251
Air-breathing Engines : High Mach Number (AGARD fourth Colloquium on Combustion and Propulsion), 18
Aitken, Yvonne : Axial Origin of the Terminal Inflorescence in the Genus *Trifolium*, 622
Akcasu, A., and others : 5-Hydroxytryptamine in Cerebrospinal Fluid, 324
Akcasu, M., and others : 5-Hydroxytryptamine in Cerebrospinal Fluid, 324
Akroyd, T. N. W. : Laboratory Testing in Soil Engineering, *review* by Dr. H. L. Penman, 891
Alami, Richard, et Ageron, Paul : Évacuation et Récupération de la Chaleur des Réacteurs Nucléaires, *review* by R. J. Syme, 636
Alberta, Research Council of : Fortieth Annual Report (1959), 660
Albinism in an American Population of the Shore Crab, *Carcinus maenas* (L.), (Anthony J. Provenzano, Jun.), 521
Albino Mouse : A Transplantable Spontaneous Osteogenic Sarcoma observed in the Muscle Tissue of an (R. G. Herne, M. Gregoire and G. Rona), 1129
Albumin (Serum) Concentration in Analbuminaemia and its Immunological Significance (Dr. J. H. Humphrey), 304
Alderson, Dr. Thomas : Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde, 485
Aldred, Dr. A. S. : Appointed to a senior lectureship in electric power engineering in the University fo Liverpool, 117
Aldridge, William G. : A New Method for the Differential Precipitation of Nucleic Acids from Aqueous Solutions, 323
Alexander, C. G., and others : Effect of Nitrate Ion on the Distribution of Sucrose in the Rat's Ventricle, 419
Alexander, K. M., and Wardlaw, J. : Dependence of Cement-Aggregate Bond-Strength on Size of Aggregate, 230
Alexander, Peter, and Lett, J. T. : Role of Oxygen in the Cross-linking and Degradation of Deoxyribonucleic Acid by Ionizing Radiations, 933
Alfvén, H. : At the Tenth General Physics Conference of the Swedish National Committee for Physics (Plasma Physics and Magneto-hydrodynamics), 557
Alga (Australian Brown), *Notheia anomala* : Structure and Systematic Position of the (M. Nizamuddin and Dr. H. B. S. Womersley), 673
Algae (Green) : Xylan of Siphonaceous (Yoshihiko Iriki, Takao Suzuki, Kazutosi Nisizawa and Tomoo Miwa), 82
Aliphatic Hydrocarbons : Radiation-induced Nitration of (Dr. Tyson Rigg), 933
Allen, Prof. R. D., and others : Streaming in Cytoplasm dissociated from the Giant Amoeba, *Chaos chaos*, 896
Alivisatos, Prof. S. G. A., and others : Non-Enzymic Reactions of Indoles with Coenzyme I, 374
Alkali Metal Ions in Analcite : Energies of Activation for Self-diffusion of (Prof. R. M. Barrer and L. V. C. Rees), 768
Alkaline C-1 Fructose-1,6-diphosphatase—Evidence for its Participation in Photosynthesis (Dr. Robert Smillie), 1024
Alkaloids : Optical Rotatory Powers of, *review* by Dr. J. Walker, 7
n-Alkyl Chloride Gases : Ionization and Attachment Coefficients in (J. C. Devins and O. H. LeBlanc, Jun.), 409
α-Alkylphenylacetic Acids and 1,2-Benzo-1-cycloalkene-3-carboxylic Acids : Plant-Growth Activity of (Kazuyoshi Kawazu, Toshio Fujita, Tetsuo Mitsui, Jiro Kato and Masayuki Katsumi), 694
All-Transistor Digital Computer : *Leo III*, a New (Leo Computers, Ltd.), 373
Allan, D. L. : Premier Colloque International de Photographie Corpusculaire, *review*, 636
Allan, I. R. H., and others : Recapture in the River Tweed of a Sea-Trout marked in Devonshire, 877
Allan, J. E. : Determination of Nickel and Cobalt by Atomic Absorption, 1110
Allan, J. T., and Scholes, Dr. G. : Effects of pH and the Nature of the Primary Species in the Radiolysis of Aqueous Solutions, 218
Allard, Dr. C. : Intracellular Localization of Enzymes, 836
Alleged Occurrence of the Perchlorate Ion in Sea-Water (R. Greenhalgh and Dr. J. P. Riley), 1107
Allen, Dr. Clifford : The Hidden Mind, *review*, 978
  Existential Psychiatry, *review*, 1062
Allen, G. P. : Awarded a Nature Conservancy Diploma Course in Conservation and Ecology at University College, London, 742
Allen, H. S. : Appointed lecturer in civil engineering at the University of Southampton, 290
Allen, J. W. : Effect of Electric Fields on Hydrogen-like Excitons, 51
  Gallium Arsenide as a Semi-Insulator, 403
Allen, Dr. N. L. : Periodic Magnetic Field Fluctuations in the Sceptre Discharge, 279
Allen, Dr. P. W. : Colloid and Polymer Science (Grafting of Methylmethacrylate Polymers on Natural Rubber Latex), 378
Allies : Parasites as Enemies and (Dr. J. Mahon), 203 ; (Prof. T. H. Davey), 203
Allison, Prof. S. K. : Penetration of Charged Particles in Matter (Measurements on the Formation of Negative Lithium Ions), 1086
Alloiteau, James : Contribution à la Systématique des Madréporaires Fossiles, *review* by Dr. H. Dighton Thomas, 95
Alloxan : Effect of Glutathione and, on the Photoperiodic Response of *Xanthium* (J. Nitsan), 81
Alloys (Gold–Silicon) : Non-crystalline Structure in Solidified (W. Klement, Jun., R. H. Willens and Prof. Pol Duwez), 869
Alloys (Metals and) : Heat Treatment of (Société Française de Métallurgie Meeting on), 559
Allsop, R. T., and others : A New Phase in a Silicon bearing 17 per cent Chromium, 8 per cent Nickel and 1 per cent Niobium Steel, 407
Allsopp, A. : Plant Tissue Cultures, *review*, 976
α-Activity of certain Botanical Materials (Prof. W. V. Mayneord, R. C. Turner and J. M. Radley), 208
α-Alkylphenylacetic Acids and 1,2-Benzo-1-cycloalkene-3-carboxylic Acids : Plant-Growth Activity of (Kazuyoshi Kawazu, Toshio Fujita, Tetsuo Mitsui, Jiro Kato and Masayuki Katsumi), 694
α-Helix in Poly-β-benzyl-L-aspartate : Screw Sense of the (E. M. Bradbury, A. R. Downie, Dr. A. Elliott and W. E. Hanby), 321
α-Pinene : Microbiological Transformation of Terpenes—Hydroxylation of (P. K. Bhattacharyya, B. R. Prema, B. D. Kulkarni and S. K. Pradhan), 689
α- and β-Pinene : Radiolysis of Terpene Hydrocarbons—Isomerization and Polymerization of (T. H. Bates and Dr. T. Ffrancon Williams), 665
Alternating Stresses required to Initiate and Propagate a Fatigue Crack in Mild Steel : Correlation of the (N. E. Frost), 233
Altitude and Distance from the Source of Sodium Chloride : Change of the Chlorine—Sodium Ratio in the Atmosphere with, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Altman, K. I., and others : Urinary Excretion of β-Amino-isobutyric Acid after Injection of Thymidine labelled with Tritium, 956
Altman, K. I., and Salomon, Prof. K. : Localization of a Halogenated Porphyrin in Mouse Tumours, 1124
Aluminium Interlayers in Clay Minerals, Montmorillonite and Vermiculite—Laboratory Synthesis (B. L. Sawhney), 261
Aluminium Single Crystal : Borrmann Effect observed in an (Koichi Nakajima and Prof. Shigeyasu Koda), 53
Amaranthus : Chromosome Numbers in (Prof. W. F. Grant), 28
Ambrose, E. J. : Appointed to the University of London readership in physical chemistry at the Institute of Cancer Research, Royal Cancer Hospital, 904
America (Latin) : Scientific Institutions and Scientists in (Unesco Centre for Scientificic Co-operation in Latin America), Vol. 4, Argentine, 29
America (North) : Sap-Transmissible Viruses associated with Diseases o Grape Vines in Europe and (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
America (North), Arctic Institute of : Grant-in-aid Programme, 831
America (South) : Cosmic Radiation Studies in, 648
America's Wild-Life : Chemical Control of Agricultural Pests and Conservation of (United States National Academy of Sciences—National Research Council Committee on), 114
American Book Publishing Record, 116
American Chemical Society : Monograph Series No. 139, The Science of High Explosives (Prof. Melvin A. Cook), *review* by Dr. W. L. Murray, 539
  Monograph Series No. 134, The Chemistry and Technology of Leather (edited by Fred O'Flaherty, William T. Roddy and Robert M. Lollar), Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
American Institute of Biological Sciences : Translations of Russian Biological Publications, 558
American Institute of Geonomy and Natural Resources : John Fleming Medal awarded to Dr. Maurice Ewing, 905
American Institute of Nutrition : Election of Dr. W. R. Aykroyd as an honorary member, 29
  Election of honorary members, 374
American Institute of Physics : To publish the *Physics of Fluids* monthly starting in 1961, 832
American Journal of Human Genetics : Symposium on Cytology and Cell Culture Genetics of Man, 116
American Meat Institute Foundation (Members of the Research Staff of the) : The Science of Meat and Meat Products, *review* by Prof. J. Hawthorn, 888
American Observatories : New (V. C. Reddish), 910
American Oligocene : The (Dr. R. M. Stainforth), 678 ; (F. E. Eames, F. T. Banner, W. H. Blow and W. J. Clarke), 679
American Population of the Shore Crab, *Carcinus maenas* (L.) : Albinism in an (Anthony J. Provenzano, Jun.), 521
American Research in Neuropsychiatry : Recent, *review* by Dr. D. H. Brinton, 447
American Society for Cell Biology : Organization of the, 649
American (Latin-) Council of Cosmic Radiation : Meeting in Rio de Janeiro, 648
American (North) Fresh-Water Biology, *review* by Dr. T. T. Macan, 6
American (North) Xanthoid Crab New to Britain (E. Naylor), 256
Americium (Internally Deposited) : Removal of, by Chelating Agents (Dr. F. D. Sowby and Dr. D. M. Taylor), 612
Amidase (Penicillin) : Bacterial (Dr. C. A. Claridge, Dr. A. Gourevitch and Dr. J. Lein), 237
Amines (Vasoconstrictor) : Influence on the Effect of, by Pretreatment with Reserpine (H. C. Sabelli), 784
Amino-Acid Pattern (Urinary), of Cats on Diets of varying Protein Content (Dr. J. P. Greaves and Dr. Patricia P. Scott), 242
Amino-Acid Sequence of Human Insulin (Dr. D. S. H. W. Nicol and Dr. L. F. Smith), 483
Amino-Acid Sequence about the Reactive Serine of a Proteolytic Enzyme from *Bacillus subtilis* (Dr. F. Sanger and D. C. Shaw), 872
Amino-Acids (Free), of the Tsetse Fly (*Glossina*), (E. Bursell), 778
Amino-Acids (N-Terminal), of Bovine Antibody (Elizabeth M. Press and R. R. Porter), 59

INDEX

Amino-Acids and related Substances : Infra-Red Spectra of, in Water (Prof. Frank S. Parker and Prof. Donald M. Kirschenbaum), 386
γ-Aminobutyric Acid-Level in the Brain : Effect of Potassium Cyanide Poisoning on the (Dr T. Tursky), 322
β-Amino-isobutyric Acid : Urinary Excretion of, after Injection of Thymidine labelled with Tritium (Dr. Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 956
2-Amino-4-meta-chloro-anilino-1,3,5,triazine (*R*-37) • Diuretic Activity of (D. J. Mehta, Prof. U. K. Sheth and Dr. C. V. Delwala), 1034
Aminoazo Dyes (Protein-bound) : Distribution of, in the Rat Liver Microsome (Dr T. Yamada, M. Matsumoto, S. Kanda and Prof. H. Terayama), 943
6-Aminopenicillanic Acid : Formation of, from Penicillin by Enzymatic Hydrolysis (Dr. G N. Rolinson, F. R. Batchelor, D. Butterworth, J. Cameron-Wood, Dr M Cole, G C. Eustace, Marian V. Hart, Dr. M. Richards and Prof. E. B. Chain), 236
Aminopyrine Analgesia (Morphine, Dihydrocodeine and) : Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J. L J. Szabó and M. Stamburgo), *erratum*, 559
Amino-Sugars : Glucosamine Values of Muramic Acid and other, by the Elson and Morgan Method (R. E. Strange), 38
Ammocoetes : Sex Ratio of (M. W Hardisty), *erratum*, 29
Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of Predicting the Nitrogen-supplying Power of Soils (A. H. Cornfield), 260
Ammonium Bromide (Urea–) : Mimetic Twinning in (C. G. C. Catesby), 765
Amoeba (Giant), *Chaos chaos* : Streaming in Cytoplasm dissociated from the (Prof. R. D. Allen, J. W. Cooledge and P. J. Hall), 896
Amoeba proteus : Effect of Pyruvate upon Nucleated and Enucleated Fragments of (Dr. Edmund Guttes and Sophie Guttes), 432
  Suppression of Cytoplasmic Division in (Dr. Edmund Guttes and Sophie Guttes), 520
Amos, S. W., and Birkinshaw, D. C. : Television Engineering, Vol 1, Fundamentals, Camera Tubes, Television Optics, Electron Optics (written in collaboration with J L. Bliss) ; Vol. 2, Video-Frequency Amplification ; Vol. 3, Wave-Form Generation ; Vol 4, General Circuit Techniques, *review* by Dr. R. L Smith-Rose, 358
Amount (Limited), of Streptomycin : Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of *Escherichia coli* grown in (Hanna Engelberg and Dr. M. Artman), 801
Amphibian Development : Electrophoretic Pattern during (H Denis), 62
Amphibian Neural Crest Cell : Pterin Synthesis in the (Tadao Hama and Masataka Obika), 326
Amphoteric Antibiotics : 'pH-Chromatography' of some (Vladimir Betina and Prof. Pavel Nemec), 1111
Amplitude of the Diurnal Variation of Cosmic Rays : Dependence on Latitude of the (Arne Eld Sandström, Eric Dyring and Stig Lindgren), 1099
Amplitude Curves for Seismic Body Waves : Oscillatory Character of (Dr. J. Vanek and J. Stelzner), 491
Ampullae of Lorenzini : Electrical Sensitivity of the (Dr. R. W. Murray), 957
Anal Canal : Sensory Innervation of the (R. P. Gould), 337
Analbuminaemia : Serum Albumin Concentration in, and its Immunological Significance (Dr. J. H. Humphrey), 304
Analcite : Energies of Activation for Self-diffusion of Alkali Metal Ions in (Prof. R. M. Barrer and L. V. C. Rees), 768
Analgesia (Morphine, Dihydrocodeine and Aminopyrine) : Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J. L J. Szabó and M. Stamburgo), *erratum*, 559
Analogue (Creatine) : Production of Muscular Weakness in Rats by a (Coy D. Fitch and Prof James S. Dinning), 421
Analogue Computer : A New British, the *Radic* (The Redifon Company), 288
Analyser (Interval) : A Biological (G. K. Smith and Prof. B. Delisle Burns), 512
Analyses of Relaxin (Edward H. Frieden), 200
Analysis : Colorimetric, *review* by A. M. G. Macdonald, 3
  Engineering Systems (Prof. Robert L Sutherland), *review* by Prof J. Greig, 359
  Numerical (Delegacy for Extra-Mural Studies, University of Oxford, Non-residential Summer School on), 374
Analysis of Metabolic Rates at the Cellular Level (Dr. L. G. Lajtha, R. Oliver, R. J. Berry and Elizabeth Hell), 919
Analysis of Small Experiments (P. Sprent), 437
Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber (L. Mullins and D. T. Turner), 145
Analysis (Differential Thermal), of some Transition Metal Ethylenediamine Tetraacetic Acid Chelates (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Analysis (Direct Infra-Red Spectral), of the Cucumber Mosaic Virus Infection Process (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Analysis (Gas-Liquid Chromatography), of C_4–C_6 Hydrocarbons : Two Highly Selective Solvents for (Dr. A. van der Wiel), 142
Analysis (Isotopic), of Silicon by Solid-Source Mass Spectrometry using Negative Ions (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Analysis (Non-destructive), of Microgram Quantities of Silver by Radioactivation (Dr. Minoru Okada), 57
Analysis (Non-destructive), of Selenium by Neutron Activation followed by Gamma-Ray Spectrometry (Dr. Minoru Okada), 594
Analysis (Preliminary), of some International Geophysical Year Observations : Distribution of Atmospheric Ozone—a (J. MacDowall), 382
Analysis (Sugar), International Commission for Uniform Methods of—Report of the Proceedings of the Twelfth Session, Washington, D.C., 1958, *review* by Prof. E. L. Hirst, 9
Analytical Approaches to Engineering Problems: Unification of, *review* by Prof. J. Greig, 359
Analytical Biochemistry, Vol. 1, No. 1, 558
Analytical Chemistry in Nuclear Reactor Technology (Oak Ridge National Laboratory Conference on), 994
Analytical Chemistry of Titanium Metals and Compounds (Maurice Codell), *review* by Prof. A. G. Quarrell, 725
Analytical Chemistry and Applied Spectroscopy (Twelfth Pittsburgh Conference on), 289
Analytical Methods : A Handbook of Colorimetric Chemical (Tintometer, Ltd.), fifth edition, *review* by A. M G Macdonald, 3
Ananthakrishnan, Dr. R. : Light Curves of Meteors, 675
Anaphylactic Sensitization of Isolated Tissues *in vitro* : Influence of the Ionic Strength of the Medium on the (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N Halpern and P. Liacopoulos), 697
Anastomoses in the Phycomycetes (Dr D. M. Griffin and Helen N. Perrin), 1039
Anatomy of Judgment : The (Dr. M. L. Johnson Abercrombie), *review* by Prof. O. L. Zangwill, 817
Anatomy (Topographical), of the Dog (Dr. O. Charnock Bradley), sixth edition revised by Prof. Tom Grahame, *review* by Prof. T. Nicol, 451
Anbar, Dr. Michael, and others : Radiolysis of Highly Enriched Oxygen-18 Water Solutions containing Hydrogen Peroxide-16,16, 57
Anderson, Sir Colin : At the sixty-sixth Annual Conference of the Museums Association (Relations of Museums and Industry), 657
Anderson, J. H. : Food and Animal Production Overseas (Food Production Problems of the Middle East), 1070
Anderson, Dr. J. R., and Baker, B. G. : Hydrocracking of Neopentane and Neohexane over Evaporated Metal Films, 937
Anderson, M. C. : Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Botany), 742
Anderson, W., and others : Radiostrontium and Radiocaesium in Milk during 1959, 108
  Comparison of Fission Product and Beryllium-7 Concentrations in the Atmosphere, 550
Andersson, Dr. Sten, and Wadsley, Dr. A. D. : Five Co-ordinated Titanium in $K_2Ti_2O_5$, 499
Andrade, Prof. E. N. da C. : *Obituary* of H. W. Robinson, 23
  A Brief History of the Royal Society, *review* by Dr. William P. D. Wightman, 356
  A Simple Method of Investigating the Creep of Metals under Simple Shear, 494
Andrewes, Dr. C. H. : Microbial Systematics, 191
Andrews, P. F. L., and others : An Unidentified Pharmacologically Active Substance extracted from Cerebral Hemispheres, 420
Angiosperms : Origin of (Prof. T. M. Harris), 847
Anglia (East) : Nature and Conservation in (Council for Nature), 649
Animal Cellulose : Human and other (Dr D. A. Hall and H. Saxl), 547
Animal Experiment : Achievement—some Contributions of, to the Conquest of Disease (Dr. Geoffrey Lapage), *review* by Dr. W. Lane-Petter, 977
Animal Experiments in Research, *review* by Dr. W. Lane-Petter, 977
Animal Health Trust : Educational Awards for 1960-61, 904
Animal Husbandry at Bristol, 647
Animal Life : South African—Results of the Lund University Expedition in 1950-1951, Vol 6 (edited by Bertil Hanstrom, Per Brinck and Gustav Rudebeck), *review* by H. Oldroyd, 1063
Animal Production Overseas : Food and (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 1070
Animal Research Laboratory (The Ian Clunie), Prospect, New South Wales (Dr. Ian W. McDonald), 980
Animal Welfare, Universities Federation for : Summer Congress, 374
Animals : Photoperiodism and related Phenomena in Plants and (edited by Robert B. Withrow)—Proceedings of the Conference on Photoperiodism, 1957, sponsored by the Committee on Photobiology of the National Academy of Sciences—National Research Council, supported by the National Science Foundation, *review* by Prof. L J Audus, 96
  Tuberculosis in (Zoological Society of London Symposium on), 996
Animals (Marine) : The Biology of (Dr. J. A. Colin Nicol), *review* by Prof C. M. Yonge, 630
  Physiology of, *review* by Prof. C M. Yonge, 630
Animals (Wild) : Translocation of, as a Means of Game Control (Dr. A. M. Harthoorn, J A. Lock and J. MacKeand), 518
Annals of the South African Museum, Vol. 45, Part 3, 199
Annelid *Lumbricus terrestris* : Biosynthesis of Squalene by the (Joyce M. Wootton and Lemuel D Wright), 1027
Anno, Dr. T. : Japanese fellowship renewed by the Ramsay Memorial Fellowship Trustees, 832
Annona squamosa L. : Unproductivity in the Colchicine-induced Tetraploids of (Prof. Ahmad Shamsul Islam), 343
Annual Review of Entomology (edited by Edward A. Steinhaus and Ray F. Smith), Vol. 5, *review* by Prof V. B. Wigglesworth, 542
Annual Review of Nuclear Science (edited by Emilio Segrè and Leonard L. Schiff, in association with Gerhart Friedlander and Walter E Meyerhof), Vol. 9, *review* by Dr E B. Paul, 182
Annual Reviews on Inorganic Chemistry, *review* by Dr. I. R Beattie, 4
Anodal Polarization : Restoration of Membrane Excitability of Calcium-deficient Muscles by (Prof. K. Koketsu and K Noda), 243
Anomalies (Perceptual), associated with a Single Contour (J. P. Wilson), 137
Anomalous Leads from a Selected Geological Environment in West-Central New Mexico (William F. Slawson and Carl F. Austin), 400
Anopheles gambiae Giles : Experimental Breeding of, in Papyrus Swamps (L. K. H. Goma), 1137
Anoxia : Comparison between the Effects of Cysteine and of, on the Rate of Mitosis in Lens Epithelium (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Antarctic : Southern Atmospheric Cyclones and the Whale Feeding Grounds in the (Dr. C. W. Beklemishev), 530
Antarctic Convergence—and Divergence (Dr. K. Wyrtki), 581
Antarctic Snows : Isotopic Composition and Temperature of Formation of (Prof E. Picciotto, X. de Maere and Dr. I. Friedman), 857
Antarctica (Byrd Station,) : Association between Aurorae and Very Low-Frequency Hiss observed at (Dr. L. H. Martin, Dr. R. A. Helliwell and K. R. Marks), 751
Anterior Byssus Retractor Muscle of *Mytilus edulis* : The Membrane Potential of the (Dr. D. H Paul), 1121
Anthocyanins : Zone Electrophoresis of (Prof. P. Markakis), 1092
Anthony, Dr. H. D. : The Faith of a Physicist, *review*, 1063
Anthony, Dr. Philip, and Zettlin, Prof. Harry : Solid–Solid Interactions on Active Adsorbents, 936

Anthropological Institute (Royal): Huxley Memorial Medal for 1961 awarded to Dr. A. E. Mourant, 114
  Rivers Memorial Medal awarded to Prof. J. C. Mitchell, 114
  Wellcome Medal for 1959 awarded jointly to E. M. Chilver and Dr. P. Kaberry, 114
  Election of Officers for 1960-61, 114
Antibiotic from Legume Seed Coats: Inhibition of Nodule Bacteria by an (J. A. Thompson), 619
Antibiotic Complex derived from a *Streptomyces* and Active against Gram-positive Bacteria (B. Sgarzi, A. M. Lugli and G. Giolitti), 1029
Antibiotic Therapy and Staphylococcal Diseases (edited by Dr. Henry Welch and Prof. Maxwell Finland), *review* by Prof. R. Knox, 637
Antibiotics *PA114B-1* and *PA114B-3*: Structure of the (D. C. Hobbs and W. D. Celmer), 598
Antibiotics (Amphoteric): 'pH-Chromatography' of some (Vladimír Betina and Prof. Pavel Nemec), 1111
Antibodies (Virus and), in the Lymph and Blood of Sheep infected experimentally with the Virus of Tick-borne Encephalitis (Doubravka Málková), 716
Antibody (Bovine): N-Terminal Amino-Acids of (Elizabeth M. Press and R. R. Porter), 59
Antibody (Ferritin-conjugated): Use of, to Localize Antigen by Electron Microscopy (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094
Antibody Responses of the Domestic Fowl to Two Soluble Bacterial Antigens (Dr. G. Gowland), 624
Anticoagulants (Artificial): Lipaemic Clearing Action of (Dr. E. P. George, Dr. G. V. Hall and Dr. G. S. Farkas), 782
Anti-Diuretic Hormone and Calcium: Effect of, on the Equivalent Pore Radius of Kidney Slices from *Necturus* (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Antiferromagnetic Behaviour (Ferromagnetic and), in the Second Transition Group (Dr. B. R. Coles and D. Griffiths), 226
Anti-Fertility Action of a Monoamine Oxidase Inhibitor (W. G. Spector), 514
Antifouling Compositions: Mode of Action of Soluble Matrix (A. Partington), 1105
Antigen: Use of Ferritin-conjugated Antibody to Localize, by Electron Microscopy (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094
Antigen, Sw^a: A 'New' Human Blood Group (Dr. T. E. Cleghorn), *erratum*, 743
Antigen or Antiserum labelled with Iodine-131: The Ouchterlony Technique using (Joan M. Rhodes), 793
Antigens: Homotransplant—Preparation of Active Cellular Fractions (L. T. Mann, jun., J. M. Corson and Prof. G. J. Dammin), 774
Antigens (Bacterial): Antibody Responses of the Domestic Fowl to Two Soluble (Dr. G. Gowland), 624
Antigens (Blood-Group): Identification of, *review* by Dr. R. Drummond, 357
Antigens (Erythrocyte): Effect of Ribonuclease on (Prof. Emanuel Hackel and Robert E. Smolker), 1036
Anti-Globulin (Coombs) Test in Laboratory Practice (Dr. L. Dunsford and Jean Grant), *review* by Dr. R. Drummond, 357
Antigonadotropic Function of the Pineal Gland and the Oxytocin of the Neurosecretory Hypothalamic System (Prof. S.-M. Milcou and S. Pavel), 950
Anti-Inflammatory Activity of Salicylate (Dr. V. Marks and Dr. M. J. H. Smith), 610
Antileukaemic Activity of Glycyrrhetinic Acid (Dr. W. Logemann, F. Lauria, G. Cudkowicz and J. Franceschini), 607
Antimetabolites into Metabolites: Adaptive Chain in the Conversion of (Dr. K. I. Markov, Dr. G. K. Saev and Dr. E. V. Golovinsky), 1041
Anti-Mouse Erythrocyte Serum (Rabbit): Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Anti-neoplastic Activity of Tetrahydro-1,3-oxazine Derivatives (Prof. T. Urbański, D. Gurne, S. Slopek, H. Mordarska and M. Mordarski), 426
Anti-Pneumococcus Type XIV Activity of Precipitins from *Ricinus communis* Seeds (Lieut.-Col. G. W. G. Bird), 415
Antirrhinum Species Hybrid: Autogenous Necrosis in an (B. J. Harrison), 527
Antiserum labelled with Iodine-131: The Ouchterlony Technique using Antigen or (Joan M. Rhodes), 793
Aorta: Role of Mucoid Substances of the, in the Deposition of Lipids (Dr. S. Gero, Dr. J. Gergely, Dr. T. Dévényi, Dr. L. Jakab, Dr. J. Székely and Dr. S. Virág), 152
Aortic Tissue (Human): Presence of Neutral Carbohydrates in (Dr. Sv. Bertelsen), 411
Aphids: Immunity of, to Insect Parasites (D. C. Griffiths), 346
Apothecaries of London, Worshipful Society of: Maccabaean Prize and Medal for an essay on a subject connected with the History of Medicine or Pharmacy, 650
Apothecaries of London, Worshipful Society of, and others: First British Congress on the History of Medicine and Pharmacy, 374
Apparatus (Thread-like), in the Petiole of *Mimosa pudica*: Behaviour of a (Dr. Hideo Toriyama), 709
Appearance ov New Deficient Characters in Streptomycin-resistant Mutants of *Bacillus subtilis* (Masamichi Kohiyama and Yonosuke Ikeda), 168
Appleton, Sir Edward: *Obituary* of Dr. Geoffrey Builder, 828
Application of Computer Techniques to Nuclear Physics Instruments (G. G. Scarrott), 854
Application in Crystal-Structure Investigation: Vector Space and its (Prof. Martin J. Buerger), *review* by Dr. J. W. Jeffery, 975
Application to the Ocean: Introduction to the Theory of Sound Transmission with (Prof. C. B. Officer), *review* by Dr. A. B. Wood, 539
Application (Foliar), of Nutrients, and Rhizosphere Microflora of *Camellia sinensis* (Dr. C. S. Venkata Ram), 621
Applications: Introduction to Symbolic Logic and its (Rudolf Carnap), translated by William H. Meyer and John Wilkinson, *review* by F. I. G. Rawlins, 729
  The Junction Transistor and its (edited by E. Wolfendale), *review* by Dr. J. R. Tillman, 1058
  The Physics of Electrostatic Forces and their (Centre National de la Recherche Scientifique International Colloquium on), 466
Applications to the Ionosphere: The Magneto-Ionic Theory and its (J. A. Ratcliffe), *review* by Sir Harrie Massey, 810
Applications (Autumn), of Potassium Gibberellate: Effect of, on Fruit Production of the Strawberry (Prof. Carter R. Smith), 620
Applied Aspects of Autoxidation: Physicochemical, Biological and (Colloid and Biophysics Committee of the Faraday Society Symposium on), 746
Applied Bacteriology, Society for: Election of Officers, 904
Applied Chemistry: Pure and (International Union of Pure and Applied Chemistry Seventeenth International Congress of), 29, *erratum*, 117
Applied Chemistry (Pure and), International Union of: Seventeenth International Congress of Pure and Applied Chemistry, 29, *erratum*, 117
Applied Chemistry (Pure and), International Union of (sponsored by the): Symposium on the Chemistry of Natural Products (organized by the Australian Academy of Science), 1080
Applied Chemistry (Pure and), International Union of, and others: International Congress on the Technology of Plastics Processing, 559
Applied Mathematics at Bangor, 197
Applied Mechanics: Tenth International Congress of, 201
Applied Physics (Pure and), International Union of: Tenth Annual International Conference on High-Energy Physics, 29
Applied Science of Victoria (Museum of), Melbourne: Annual Report for 1958-59, 372
Applied Spectroscopy: Analytical Chemistry and (Twelfth Pittsburgh Conference on), 289
Approaches (Analytical), to Engineering Problems: Unification of, *review* by Prof. J. Greig, 359
Aquation (Octahedral): Orienting Effects in (Sir Christopher Ingold, Prof. R. S. Nyholm and Dr. M. L. Tobe), 477
Aqueous Electrolyte Solutions: Ultrasonic Velocities in (Dr. C. G. Balachandran), 136
Aqueous Solutions: Effects of pH and the Nature of the Primary Species in the Radiolysis of (J. T. Allan and Dr. G. Scholes), 218
  A New Method for the Differential Precipitation of Nucleic Acids from (William G. Aldridge), 323
Arc (Two-Neuron): Properties of the (Hind-Limb Reflexes in the Kitten), (Dr. Stan Skoglund), 134
Arcamone, F., and others: Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238
Archaeological Field Experiments: Research Committee on, 289
Archer, Dr. R. K.: Eosinophil Leucocyte-attracting Effect of Histamine in Skin, 155
Arcs (Cold-Cathode): Stepwise Ablation and Heat Transfer in (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Arctic Institute of North America: Grant-in-aid Programme, 831
Arden, J. W., and others: Radioactive and Natural Strontium in Human Bone (Atomic Energy Research Establishment, *R3246*), 994
Are the Laws of Nature Symmetrical? (Prof. O. R. Frisch), 638
Argentine (Scientific Institutions and Scientists in Latin America, Vol. 4), (Unesco Centre for Scientific Co-operation in Latin America), 29
Arginine Groups in Nucleoprotein in the Cell Nucleus: Selective Cytochemical Demonstration of (Dr. E. A. Barnard and Dr. L. G. E. Bell), 508
Arginine Vasotocin: Evidence for the Identity of Natriferin, the Frog Water-Balance Principle and (Prof. Wilbur H. Sawyer), 1030
L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin: Synthesis and Biological Properties of (E. D. Nicolaides, H. A. DeWald, Patricia G. Shorley and Dr. H. O. J. Collier), 773
Argon (Potassium–) Ages of some Rocks from the South Atlantic (John A. Miller), 1019
Argyle, Michael: Religion and Social Structure, *review*, 96
Arid Zones: Problems of the (Unesco Symposium on), 295
Armourers and Brasiers' Research Fellowship awarded to Dr. J. H. Brunton, 291
Armstrong, jun., S. Howard, and others: Immunological Relationships between the Rat Glomerulus and Nephritogenic Streptococci, 1095
Arnold, Prof. A. H. M.: General and Linear Circuit Theory, *review*, 811
Arnold, Dr. K. W., (von Engel, Dr. A., and): Stepwise Ablation and Heat Transfer in Cold-Cathode Arcs, 1101
Arnold, Dr. P. W.: Potassium-supplying Power of some British Soils, 436
  Potash in Wet and Dry Soils, *review*, 976
Aromatic Hydroxy Compounds: Effect of some, on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, C. Druce and C. C. Ware), 422
Arousal in the Drowsy State: Paradoxical Blocking and (Dr. L. Goldie and Dr. J. M. Green), 952
Array: A Highly Directive Rotating, for 16 Mc./s. (Prof. J. A. Thomas and Dr. R. W. E. McNicol), 398
Arsenide (Gallium), for γ-Ray Spectroscopy (W. R. Harding, C. Hilsum, M. E. Moncaster, D. C. Northrop and Dr. O. Simpson), 405
Arsenide (Gallium), as a Semi-insulator (J. W. Allen), 403
Art (Rock-Shelter), in Malaya: Newly Discovered (J. M. Matthews), 373
Artefact due to Thioureas or Thiouracils: Staining for Iodine in Chromatograms of Human Plasma—an (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691; *erratum*, 1079
Arterial Tissue (Human): Effect of Testicular Hyaluronidase on the Permeability of (Jorgen Matzke), 873
Arthropods: Attachment of Immature Simuliidae to other (Dr. D. J. Lewis, E. T. Reid, R. W. Crosskey and J. B. Davies), 618
Artificial Anticoagulants: Lipaemic Clearing Action of (Dr. E. P. George, Dr. G. V. Hall and Dr. G. S. Farkas), 782
Artificial Food: Silkworm Raising on (Toshifumi Fukuda, Mitsumasa Suto and Yoshitochi Higuchi), 669
Artificial Induction of the Imaginal Diapause in *Coccinella 7-punctata* L.: Prevention and (I. Hodek and J. Čerkasov), 345
Artificial Thickening of Bone and the Piltdown Skull (Prof. Ashley Montagu), 174; (Dr. Kenneth P. Oakley), 174
Artman, Dr. M. (Engelberg, Hanna, and): Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin, 801
Ascaris lumbricoides: Use of Collagenase in the Characterization of Pseudocoelomic Membranes of (Barbara Dawson), 798

Ascites (Mouse): Isolation of a Non-pathogenic Tumour-destroying Virus from (Dr. J. G. Bennette), 72
Ascites Cells (Mouse): Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in (Dr. A. R. Crathorn and Dr. K. V. Shooter), 614
Ascites Hepatoma (Yoshida): Inhibition of Aerobic Glycolysis in, by Tartronic Acid (Dr. L. Fiume), 792
Ascites Tumour Cells *in vitro*. Optimal Protein Synthesis by (Dr. M. J. Fraser), 1114
Ascorbigen, 3-Indolylacetonitrile and Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in *Brassica oleracea L.* Biogenesis of (Dr. M. Kutáček, Dr. Z. Procházka and Dr. D. Grunberger), 61
Ashby, Dr. W. Ross: The Relativity of 'Meaning', 532
Ashgar, Dr. A. G.: Problems of the Arid Zones (Public Awareness and the Educational Problem—Irrigation and Land Use—Pakistan), 296
Ashoka: Early India and Pakistan to (Sir Mortimer Wheeler), *review* by M. C. Burkitt, 94
Askochensky, Prof. A. N.: Problems of the Arid Zones (Alternative Uses of Limited Water Supplies—U.S.S.R.—Basic Trends and Methods of Water Control), 296
ASLIB: Survey on Indexes for Scientific and Technical Reports, 372
Aspects of Atherosclerosis: Some, *review* by Dr. G. S. Boyd, 634
Aspects of the Fibrinogen–Fibrin Transition. Some (K. Laki, Jules A. Gladner and J. E. Folk), 758
Aspects of Plant Nutrition, *review* by Prof. Walter Stiles, 815
Aspects (Applied), of Autoxidation: Physico-chemical, Biological and (Colloid and Biophysics Committee of the Faraday Society Symposium on), 746
Aspects (Haemodynamic), of Atherogenesis (Wei Young), 425
Aspects (The Two), of Science (Sir George Thomson), 837
Aspergillus fumigatus, Fresenius. Ubiquinone(50) and Ubichromenol in (N. M. Packter and Dr. J. Glover), 413
Aspheric Imaging Systems (Dr. C. R. Burch), 854
Assay of Air-borne Material: Radioactive Labelling of Membrane Filters for the (Dr. G. Kubie and Dr. K. Spurny), 930
Assay of Corticosteroids in the Chick Embryo (Sir Macfarlane Burnet and N. L. Warner), 938
Assessing the Colour Changes of Ageing Bloodstains. Use of Reflectance Measurements in (Dr. D. Patterson), 688
Assimilation (Radiophosphorus), in Organic and Inorganic Forms in Salmon: Bacterial Effect and (Dr. P. N. Srivastava), 83
Assistance from the United Kingdom for Overseas Development (H. M. Treasury), 266
Assistance (Special), for Effluent Liaison (British Leather Manufacturers' Research Association), 992
Association between Auroras and Very Low-Frequency Hiss observed at Byrd Station, Antarctica (Dr. L. H. Martin, Dr. R. A. Helliwell and K. R. Marks), 751
Association of Cornea Proteins with Water. Infra-red Examination of the (Dr. S. Bakerman and C. Mitchell), 1033
Association of Pigment with the Cell Envelope of *Serratia marcescens* (*Chromobacterium prodigiosum*), (Mira Purkayastha and Prof. R. P. Williams), 349
Astbury, Prof. W. T.: Ninth Procter Memorial Lecture of the Society of Leather Trades Chemists, 905
Astronomes: Les Observatoires Astronomiques et les (Fernand Rigaux), *review* by Dr. R. v. d. R. Woolley, 1063
Astronomiques (Les Observatoires), et les Astronomes (Fernand Rigaux), *review* by Dr. R. v. d. R. Woolley, 1063
Astrophysics of Non-Static Systems, *review* by Prof. W. H. McCrea, 538
Ataractic Drugs. Effects of, on the Blood-Pressure and Heart-Rate of Dogs (L. W. Hall and D. E. Stevenson), 696
Atherogenesis. Haemodynamic Aspects of (Wei Young), 425
Atherosclerosis: Connective Tissue, Thrombosis and—Proceedings of a Conference held at Princeton, N.J., 1958 (edited by Irvine H. Page), *review* by Dr. G. S. Boyd, 634
  Hormones and—Proceedings of the Conference held in Brighton, Utah, 1958 (edited by Gregory Pincus), *review* by Dr. G. S. Boyd, 634
  Some Aspects of, *review* by Dr. G. S. Boyd, 634
Atkin, N. B., and Ross, Angela J.: Polyploidy in Human Tumours, 579
Atkinson, F.: The English Newspaper since 1900 (Library Association, Special Subject List No. 32), 116
Atlantic (South): Pelagic Polychaetes of the (N. Tebble), 289
  Potassium–Argon Ages of some Rocks from the (John A. Miller), 1019
Atlantic Ocean (Eastern): Magnetization of Sediment Cores from the (M. J. Keen), 220
Atlas Podnebí Ceskoslovenské Republiky (Climatic Atlas of the Czechoslovak Republic), *review* by G. A. Bull, 543
Atlas (Climatic), of the Czechoslovak Republic, *review* by G. A. Bull, 543
Atmosphere: Blue Hazes in the (Dr. F. W. Went), 641, *erratum*, 994
  Change of the Chlorine—Sodium Ratio in the, with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
  Comparison of Fission Product and Beryllium-7 Concentrations in the (W. Anderson, R. E. Bentley, R. P. Parker, J. O. Crookall and L. K. Burton), 550
  Energy for the, *review* by Prof. P. A. Sheppard, 974
  Small-Scale Turbulent Diffusion in the (Dr. L. A. Clarenburg and C. E. Speans-v. d. Tang), 586
Atmosphere (Lower): Turbulent Transfer in the (Dr. C. H. B. Priestley), *review* by Prof. P. A. Sheppard, 974
Atmosphere (Solar): Temperatures reached in Electrical Discharges in the (Dr. C. E. R. Bruce), 865
Atmosphere (Upper) Wind: Effect of, on the Rotation of Satellite 1958 δ1 (Dr. C. R. Faulkner), 926
Atmosphere (Upper-) Wind Studies by *Skylark* Rocket Sodium Experiment (Dr. G. V. Groves), 1001
Atmospheric Cyclones (Southern), and the Whale Feeding Grounds in the Antarctic (Dr. C. W. Beklemishev), 530
Atmospheric Nitrate over the United States: Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Atmospheric Ozone. Distribution of—a Preliminary Analysis of some International Geophysical Year Observations (J. MacDowall), 382
Atmospheric Research, United States National Centre of: Appointment of Dr. Walter Orr Roberts as director, 200
Atmospherics on 20 kc./s. at the Time of Local Auroras (Father E. Gherzi), 225
Atom 1960, an Illustrated Summary of the Sixth Annual Report (1959-60) of the United Kingdom Atomic Energy Authority, 1084
Atomic Absorption. Determination of Nickel and Cobalt by (J. E. Allan), 1110
Atomic Absorption Spectrophotometric Determination of Molybdenum and Strontium (D. J. David), 1109
Atomic Beam Frequency Standards. A Comparison of (R. E. Beehler, R. C. Mockler and C. S. Snider), 681
Atomic Energy: A Plain Man's Guide to (P. J. Duncton), 1076
Atomic Energy in the Soviet Union (Arnold Kramish), *review* by Dr. S. C. Curran, 630
Atomic Energy Agency (International): Review Series No. 3, Electronic Equipment used in the Nuclear Energy Industry in France (P. Desneiges, M. Doureau, L. Koch and J. Weill), 1076
Atomic Energy Authority (United Kingdom): *Zebra* (Zero Energy Breeder Reactor Assembly), 114
  Report of the Committee on Training in Health and Safety to the Authority Committee on Health and Safety, 471
  Re-appointment of Lord Citrine, Sir James Chadwick and C. F. Kearton as part-time members, 743
  Course for Trade Union Officials on the Industrial Uses of Radioisotopes, 905
  Hector, a New Research Reactor, 992
  Sixth Annual Report (1959-60), 1082
  Atom 1960—an Illustrated Summary of the Sixth Annual Report, 1084
Atomic Energy Authority (United Kingdom), and the Agricultural Research Council: Joint Report on the Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the Reactor Accident at Windscale in October 1957, 1077
Atomic Energy Commission (Danish): Third Annual Report (1958-59), 33
Atomic Energy Research in Denmark, 33
Atomic Energy Research Establishment (United Kingdom). Wantage Research Laboratory (B. S. Smith), 292
  Appointment of Dr. F. A. Vick as director, 556
  Appointment of Dr. R. Spence as deputy director, 556
  Appointment of L. Grainger as assistant director, with special responsibilities for applied research, 556
  Radioactive and Natural Strontium in Human Bone (J. W. Arden, F. J. Bryant, E. H. Henderson, G. D. Lloyd and A. G. Morton), 994
Atomic Energy and Space Research. Resources for, 1055
Atomic Nuclei. Theory of (Publication by the Physical Society of Japan of a volume of papers on), 743
Atomic Radiation. The Biological Effects of—Summary Reports from a Study by the National Academy of Sciences (United States National Academy of Sciences—National Research Council), 380
Atomic Reactor (*Moata*). Australia's Second, 741
Atomkernen: Nutzenergie aus (Dr. Karl Rudolf Schmidt), *review* by K. R. E. Smith, 979
Atoms?: Phlogiston or, 627
Atoms for Peace Digest. Title changed to *Science Horizons* (United States Information Service), 902
Atoms (Oxygen): Recombination of, in the Gas Phase (P. G. Dickens, R. D. Gould, Prof. J. W. Linnett and A. Richmond), 686
Attachment of Immature Simuliidae to other Arthropods (Dr. D. J. Lewis, E. T. Reid, R. W. Crosskey and J. B. Davies), 618
Attachment Coefficients: Ionization and, in *n*-Alkyl Chloride Gases (J. C. Devins and O. H. LeBlanc, jun.), 409
Attainments, Qualifications and Attitudes of Students entering Training Colleges: Recruits to Teaching—a Study of the (F. W. Land), 750
Attitudes of Students entering Training Colleges: Recruits to Teaching—a Study of the Attainments, Qualifications and (F. W. Land), 750
Aubert, Dr. Georges: Problems of the Arid Zones (Soil Science, including Soil Conservation), 295
Audus, Prof. L. J.: Photoperiodic Phenomena, *review*, 96
  Herbicides and the Soil (Microbiological Breakdown of Herbicides in Soils), 376
Auerbach, Dr. C.: Biological Effects of Atomic Radiation, 380
Auerbach, I.: Elected president of the International Federation of Information Processing Societies, 655
Augustin, Dr. Rosa, and Hayward, Barbara J.: Cleavage of Human γ-Globulin, 129
Augustinsson, Dr. K.-B., and Olsson, Dr. B.: A Genetically Determined Enzyme in the Pig, 924
Auroras (Local): Atmospherics on 20 kc./s. at the Time of (Father E. Gherzi), 225
Auroras and Very Low-Frequency Hiss observed at Byrd Station, Antarctica: Association between (Dr. L. H. Martin, Dr. R. A. Helliwell and K. R. Marks), 751
Auroral Structures: Theory of (E. R. Harrison), 383
Austenite. Stabilization of, by Hydrogen (E. G. Ramachandran and C. Dasarathy), 684
Austenite (Retained), and the Tempering of Martensite (S. Matas and Prof. R. F. Hehemann), 685
Austin, Carl F. (Slawson, William F., and): Anomalous Leads from a Selected Geological Environment in West-Central New Mexico, 400
Australia: Biogeography and Ecology in (edited by A. Keast, R. L. Crocker and C. S. Christian), *review* by Prof. A. J. Marshall, 543
  Research on Tinplate in, 904
Australia's Second Atomic Reactor (*Moata*), 741
Australia (South) Museum: Annual Report for 1958-59, 287
Australian Academy of Science: Selby Fellowship for 1960 awarded to Dr. W. Deuchars, 464
  Symposium on the Chemistry of Natural Products (sponsored by the International Union of Pure and Applied Chemistry), 1080
Australian Bivalve Gastropods (Robert Brun), 44
Australian Bread Research Institute Laboratories, 291
Australian Brown Alga, *Notheia anomala*. Structure and Systematic Position of the (M. Nizamuddin and Dr. H. B. S. Womersley), 673

Australian Commonwealth Scientific and Industrial Research Organization: Establishment of a new Sugar Research Laboratory, 372
  Appointment of Dr. H. H. Hatt as leader of research in the Sugar Research Laboratory, 372
  List of Publications to December 31, 1959, 466
  Appointment of Dr. S. D. Hamann as chief of the Division of Physical Chemistry, 901
  Retirement of S. A. Clarke as chief of the Division of Forest Products, 901
  Grant of £6,000 from the Broken Hill Proprietary Company, to support tinplate research, 904
Australian Native Plants for Home Gardens (A. E. Brooks), *review* by Dr. R. Melville, 637
Australian (Aboriginal): Doctor Ruggles Gates and the (Prof. A. A. Abbie), 375
Australian (Central) Aborigine: Haematology of the (J. R. Casey-Smith), 903
Australopithecus. Biography of, *review* by Sonia Cole, 888
Authors (Chemical Society): Handbook for (Chemical Society, Special Publication No. 14), 832
Autogenous Necrosis in an *Antirrhinum* Species Hybrid (B. J. Harrison), 527
Automatic Programming in the U.S.S.R., *review* by R. J. Ord Smith, 92
Autonomic Nerve–Smooth Muscle Transmission (G. Burnstock and Mollie E. Holman), 951
Autoradiography at -195°C. Localization by, of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Autotetraploid Plants: Frequency of Quadrivalents in (Dr. J. W. Morrison and Dr. T. Rajhathy), 528
Autoxidation: Physico-chemical, Biological and Applied Aspects of (Colloid and Biophysics Committee of the Faraday Society Symposium on), 746
Autret, Dr. Marcel: Appointed director of the Nutrition Division of the United Nations Food and Agriculture Organization, 743
Autumn Applications of Potassium Gibberellate: Effect of, on Fruit Production of the Strawberry (Prof. Carter R. Smith), 620
Auxin Transport: A Method for the Detection of Inhibition of (B. E. S. Gunning), 428
Availability (Relative), of some Strontium-90 Compounds in Soil (Dr. R. L. Uhler and Dr. F. P. Hungate), 252
Avena Coleoptile: Plastids of the (Helen P. Sorokin and Prof. Kenneth V. Thimann), 1038
Average Composition of Granites, the Genesis of Tektites, and Petrogenesis (Prof. E. H. Timothy Whitten), 867
Average Water Vapour Content of the Air (J. K. Bannon and L. P. Steele), 748
Avery, R. A.: Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Zoology), 742
Avian Embryo: The (Prof. Alexis L. Romanoff), *review* by Prof. C. H. Waddington, 814
Aviation: Guide to Hygiene and Sanitation in (World Health Organization of the United Nations), 911
Aviation, Ministry of: Retirement of F. S. Barton, 646
  Promotion of C. J. Francis to Deputy Chief Scientific Officer, and appointed counsellor (Defence Research and Supply) to the United Kingdom High Commission, Canada, 646
  Appointment of M. B. Morgan as deputy controller of aircraft (research and development), 646
Awad, Dr Mohammed: Problems of the Arid Zones (Nomadism in relation to Grazing Resources—The Near East Arab Countries), 296
Awards for articles on Electronics (Electronic Engineering Association), 116
Awards (Grants and), for 1961 (Lalor Foundation), 1078
Awards (Studentship and Scholarship), for 1960 (Royal Commission for the Exhibition of 1851), 116
Awards (Technological), National Council for: Report for 1959-1960, 286
Awards (Travel), for Women Engineers (Caroline Haslett Memorial Trust), 116
Axelrod, Dr. J., and others: Effect of Cocaine on the Disposition of Noradrenaline labelled with Tritium, 604
Axial Origin of the Terminal Inflorescence in the Genus *Trifolium* (Yvonne Aitken), 622
Axon, Dr. H. J.: The Sulphide Phase in some Iron Meteorites, 406
Aykroyd, Dr. W. R.: Made an honorary member of the American Institute of Nutrition, 29, 374
Aylmore, L. A. G., and Quirk, Dr. J. P.: Domain or Turbostratic Structure of Clays, 1046
8-Azaguanine: Transformation of Resistance to, in *Diplococcus pneumoniae* (Francis M. Sirotnak, Ramona B. Lunt and Dorris J. Hutchison), 800
Azo-Dye Method (A Simple), for Histochemical Demonstration of Acid Phosphatase (Dr. Tibor Barka), 248
Azo Dyestuffs: Use of, for the Polarographic Determination of the Lanthanides (T. M. Florence and L. E. Smythe), 771
Azotobacter vinelandii as the Test Organism: Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids with (Maharani Chakravorty), 239
Azzone, Dr. Giovanni Felice, and Ernster, Dr. Lars: A High-Energy Phosphate Requirement for Succinate Oxidation in Uncoupled Rat Liver Mitochondria, 65

BAADE, Walter: *Obituary* by Prof. Fred Hoyle, 1075
Bacharach, A. L.: Influence of Editors, 121
Bacilli (Enteric): Effect of the Peritoneal Fluid of the Guinea Pig on Strains of (Prof. R. J. Roantree and L. R. Collis), 1045
Bacillus subtilis: Amino-Acid Sequence about the Reactive Serine of a Proteolytic Enzyme from (Dr. F. Sanger and D. C. Shaw), 872
  Appearance of New Deficient Characters in Streptomycin-resistant Mutants of (Masamichi Kohiyama and Yonosuke Ikeda), 168
Backett, Prof. E. Maurice: Medicine as a Social Science, *review*, 633
Background: Francis Bacon without his, *review* by Prof. B. Farrington, 817
Bacon (Francis), the First Statesman of Science (J. G. Crowther), *review* by Prof. B. Farrington, 817
Bacon (Francis) without his Background, *review* by Prof. B. Farrington, 817
Bacon, Dr. G. E.: Ferrimagnetism in Theory and Practice, *review*, 974
Bacteria as a Source of Food for Black-Fly Larvae (F. J. H. Fredeen), 963
Bacteria (Gram-positive): An Antibiotic Complex derived from a *Streptomyces* and Active against (B. Sgarzi, A. M. Lugli and G. Giolitti), 1029
Bacteria (Green Sulphur): A New Species of (V. V. Shaposhnikov, E. N. Kondratieva and V. D. Federov), 167
Bacteria (Lactic Acid): Two Types of Catalase-like Activity in (R. Whittenbury), 433, *erratum*, 466
Bacteria (Nodule): Inhibition of, by an Antibiotic from Legume Seed Coats (J. A. Thompson), 619
Bacteria (Transformable): Fate of Transforming Deoxyribonucleate following Fixation by, 1 (Dr. Maurice S. Fox and Dr. Rollin D. Hotchkiss), 1002; 2 (Dr. Maurice S. Fox), 1004
Bacterial Antigens: Antibody Responses of the Domestic Fowl to Two Soluble (Dr. G. Gowland), 624
Bacterial Effect of Radiophosphorus Assimilation in Organic and Inorganic Forms of Salmon (Dr. P. N. Srivastava), 83
Bacterial Mutant with Impaired Potassium Transport (Dr. Stanley G. Schultz and Dr. A. K. Solomon), 802
Bacterial Penicillin Amidase (Dr. C. A. Claridge, Dr. A. Gourevitch and Dr. J. Lein), 237
Bacterial Population of the Nose and Skin (H. Williams Smith and W. E. Crabb), 288
Bacteriology (Applied), Society for: Election of Officers, 904
Bacteriophage λ: Mutations affecting the Density of (G. Kellenberger, M. L. Zichichi and J. Weigle), 161
T_2 Bacteriophage: Evidence for Internal Organization of Nucleic Acid in (Irwin J. Bendet, David A. Goldstein and Max A. Lauffer), 781
Bacteriophages (*Lactobacillus*): Host-Range of (Prof. J. N. Coetzee, H. C. de Klerk and T. G. Sacks), 348
Baden-Powell, D. F. W.: Appointed lecturer in prehistoric archaeology at the University of Oxford, 117
Badger, Prof. G. M., and others: Mode of Formation of 3,4-Benzopyrene in Human Environment, 663
Bagnall, Dr. K. W.: Comprehensive Inorganic Chemistry, *review*, 185
Bagshaw, A.: At the second Annual Conference of the British Computer Society (Organization of Computing Centres in Industrial Establishments), 656
Bailey, Prof. W. N.: Confluent Hypergeometric Functions, *review*, 93
Bainbridge, V.: Plankton of the Estuary and Offshore Waters of the Sierra Leone River, 557
Baird, D. E.: Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Zoology), 742
Bajpai, L. S., and others: Action of Tetrakis (Hydroxymethyl) Phosphonium Chloride on Wool, 602
Baker, B. G. (Anderson, Dr. J. R., and): Hydrocracking of Neopentane and Neohexane over Evaporated Metal Films, 937
Baker, Dr. Ruth V., and others: Melanin Granules and Mitochondria, 392
Bakerman, Dr. S., and Mitchell, C.: Infra-red Examination of the Association of Cornea Proteins with Water, 1033
Balachandran, Dr. C. G.: Ultrasonic Velocities in Aqueous Electrolyte Solutions, 135
Balchin, Prof. W. G. V.: Water Resources in the United States, 562
Ball, D. F.: Relic-Soil on Limestone in South Wales, 497
Ball Lightning. Electromagnetic Standing Waves and (Dr. Lewi Tonks), 1013
Ballard, P.: The Royal Botanic Gardens, Kew, 119
Balls, Dr. W. Lawrence: *Obituary* by Dr. D. W. Hill, 989
Baltá Calleja, F.: Spanish fellowship renewed by the Ramsay Memorial Fellowship Trustees, 832
Bamford, Dr. C. H., and Kitchener, Dr J. A. Colloid and Polymer Science (Calculation of Free-radical Reactivity and Stability of Colloidal Model Suspensions), 378
Banana Fruit-spot ('Speckle') caused by *Deightoniella torulosa* (Syd.) Ell. (Dr. D. S. Meredith), 961
Bangor Research Station of the Nature Conservancy, 744
  Appointment of Dr. Elfyn Hughes as director, 744
Bank (International), for Reconstruction and Development: Articles of Agreement of the proposed International Development Association, as approved for submission to Governments by the Executive Directors of the, 266
Banner, F. T., and others: The American Oligocene, 679
Bannon, J. K., and Steele, L. P.: Average Water Vapour Content of the Air, 748
Bantu (South African): The Rh Factor C in (Dr. A. Zoutendyk and Dr. H. Teodorczuk), 790
Barash, M.: Optically Active Forms of a Derivative of Tetra-substituted Sulphur, 591
Barber-Colman Company, Houston: Establishment of a new Gas Chromatography Research Center, 289
Barents Sea: Echo Sounding Experiments in the (I. D. Richardson, D. H. Cushing, F. R. Harden Jones, R. J. H. Beverton and R. W. Blacker), 855
Bargett, W. E.: Effectiveness in Industry (Presidential Address to the Institution of Metallurgists), 378

Biological Structure and Function (International Union of Biochemistry and the International Union of Biological Sciences Symposium on), 905
Biological (Marine) Reports from Denmark, *review* by Dr. A. J. Southward, 360
Biological and Applied Aspects of Autoxidation : Physico-chemical, (Colloid and Biophysics Committee of the Faraday Society Symposium on), 746
Biology : Fresh-Water (Henry Baldwin Ward and George Chandler Whipple), second edition, edited by Prof. W. T. Edmondson, *review* by Dr. T. T. Macan, 6
International Review of (edited by Carl C. Pfeiffer and John R. Smythies), Vol. 1, *review* by Dr. D. H. Brinton, 447
North American Fresh-Water, *review* by Dr. T. T. Macan, 6
Tropical Climates and (Dr. G. S. Carter), 843
Biology, Institute of : Symposium on the Biology of Space Travel, 29
Symposia No. 8, The Effects of Pollution on Living Material (edited by W. B. Yapp), *review* by Dr. G. C. Ware, 1061
Biology, Institute of (Parasitology Group) : Spring Meeting, 203
Biology of Marine Animals (Dr. J. A. Colin Nicol), *review* by Prof. C. M. Yonge, 630
Biology of Polluted Waters (Dr. H. B. N. Hynes), *review* by Dr. G. C. Ware, 1061
Biology of Pollution, *review* by Dr. G. C. Ware, 1061
Biology of Space Travel (Institute of Biology Symposium on), 29
Biology (Cell), American Society for : Organization of the, 649
Biology (Cell), and Growth Inhibition (Cell Biology Programme of Unesco International Symposium on), 836
Biology (Experimental), Society for : Symposia No. 13, Utilization of Nitrogen and its Compounds by Plants (edited by H. K. Porter), *review* by Prof. Walter Stiles, 815
Biology (Quantitative) : Cold Spring Harbor Symposia on, Vol. 24, Genetics and Twentieth Century Darwinism, *review* by Dr. H. Kalmus, 726
Biology (Radiation), of *Vicia faba* in relation to the General Problem (Dr. John Read), *review*, 8
Biophysical Society (British) : Formation of the, 559
Biosynthesis of Cellulose by *Acetobacter acetigenum* (Dr. A. M. Brown and Dr. J. A. Gascoigne), 1010
Biosynthesis of Linamarin and Lotaustralin in White Clover (G. W. Butler and Beris G. Butler), 780
Biosynthesis of Nucleic Acids (Biochemical Society Colloquium on), 994
Biosynthesis of Squalene by the Annelid *Lumbricus terrestris* (Joyce M. Wootton and Lemuel D. Wright), 1027
Biosynthesis of Sucrose by Preparations from Potatoes stored in the Cold and at Room Temperature (Dr. Sigmund Schwimmer and Edward S. Rorem), 1113
Biosynthesis (Starch) : Mechanism of (Dr. Marta A. Rongine de Fekete, Dr. Luis F. Leloir and Dr. Carlos E. Cardini), 918
Biram, J. G. : Measurement of Slip (*Ko*) and Viscous (*Bo*) Flow Coefficients of Permeable Solids, 865
Birbeck, M. S. C., and Mercer, E. H. : Cytoplasmic Particles and their Role in Protein Synthesis (Electron Microscopy in formulating Hypotheses of some Aspects of Protein Synthesis), 644
Birbeck, M. S. C., and others : Melanin Granules and Mitochondria, 392
Birch, Dr. S. F. : *Obituary* by Dr. R. A. Dean, 111
Bird, Lieut.-Col. G. W. G. : Anti-Pneumococcus Type XIV Activity of Precipitins from *Ricinus communis* Seeds, 415
Bird Preservation, International Council for : Annual Report for 1959, 287
Birds : Effect of Cortisone on Degenerating Nerve Fibres in (Dr. P. Glees), 327
Embryos of, *review* by Prof. C. H. Waddington, 814
Variability in Levels of Blood Uric Acid in Five Species of (Jack W. Hudson and Charles R. Taylor), 788
Birds in Colour (illustrated by Karl Aage Tinggaard, with descriptions by Bruce Campbell), *review* by B. J. G. Marchand, 273
Birkenshaw, D. C. (Amos, S. W., and) : Television Engineering, Vol. 1, Fundamentals, Camera Tubes, Television Optics, Electron Optics (written in collaboration with J.-L. Bliss) ; Vol. 2, Video-Frequency Amplification ; Vol. 3, Wave-form Generation ; Vol. 4, General Circuit Techniques, *review* by Dr. R. L. Smith-Rose, 358
Birmingham, W. B. : Appointed senior lecturer in economics at the University of Leicester, 743
Bishop, Prof. David W. : X and Y Spermatozoa, 255
Bishop, H., and others : Effect of Wheat Gluten on the Peristaltic Reflex, 516
Biswas, A. B., and others : New Compounds for the Control of Water Evaporation, 870
Biswas, Manjula (Sircar, Prof. S. M., and) : Viability and Germination Inhibitor of the Seed of Rice, 620
Bituminous Coal (High-volatile) : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Bivalent Metal Ions in Transphosphorylation : Synergism of (Dr. John M. Lowenstein), 570
Bivalve Gastropods : Australian (Robert Burn), 44
Bjotvedt, G., and others : Protection against Liver Injury due to Murine Hepatitis Virus, 507
Black, D. St. C. : Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Black Chromium Electro-deposit : Hexagonal Modification of (Hideya Okada and Takeo Ishida), 496
Black-Fly Larvae : Bacteria as a Source of Food for (F. J. H. Fredeen), 963
Blacker, R. W., and others : Echo Sounding Experiments in the Barents Sea, 855
Blackwell, M. J. : Recent Scientific Activities at Halley Bay—International Geophysical Co-operation (1959), 982
Blade : Relative Lengths of Leaf Sheath and, with reference to the Developmental Stages of the Rice Plant (Dr. B. Saha), 259

Blaha, M., and others : Measurement of Magnetic Fields in Chromospheric Flares, 224
Blake, J. N. (Simms, E. M., and) : At the Nineteenth Meeting of the Research Panel of the British Gelatine and Glue Research Association (The Swelling of Gelatine Films), 998
Blakely, C. F., and Wassermann, Dr. A.: Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Kinetics and Mechanism, 662
Blakely, C. F., and others : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy, 662
Blamire, R. V. : Tuberculosis in Animals (Tuberculosis and Food Inspection), 997
Blaschko, Dr. H., and others : Melanin Granules and Mitochondria, 392
Blastopore : Mouth and (Dr. Joan B. Williams), 1132
Blaxland, J. D. . Tuberculosis in Animals (Tuberculosis in Poultry), 997
Bleached Variant of *Euglena gracilis* showing a Doubling of the Content of Deoxyribonucleic Acid (Dr. George Brawerman, Carole A. Rebman and Prof. Erwin Chargaff), 1037
Bloch, Prof. Hubert, and Nordin, Albert A. : Production of Tuberculin Sensitivity, 434
Block, Prof. Matthew : Wound Healing in the New-Born Opossum (*Didelphis virginianam*), 340
Blocking (Paradoxical), and Arousal in the Drowsy State (Dr. L. Goldie and Dr. J. M. Green), 952
Blomgren, Dr. E. A., and Bockris, Dr. J. O'M. : Simultaneous Measurement of Adsorption and Electrodekinetic Parameters at Metal Surfaces, 504
Blood of Normal and Leukaemic Subjects : Zinc Content of Erythrocytes and Leucocytes of (E. Dennes, R. Tupper and Prof. A. Wormall), 302
Blood of the Rabbit Right and Left Heart Ventricles : Platelet-Count Differences in (Dr. J. George Sharnoff and Dr. Vito [illegible]ardino), 334
Blood of Sheep Infected experimentally with the Virus of Tick-borne Encephalitis : Virus and Antibodies in the Lymph and (Doubravka Málková), 716
Blood and Bone Marrow Cells : Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Blood Cell Membrane (Red) : Chemical Constitution of the (Dr. T. Fehér and Dr. Béla Matkovics), 701
Blood Donors (398), from Dakar (Senegal) : Haptoglobin Types in (Dr. J. Moullec, Dr. J. M. Fine and J. Linhard), 517
Blood Donors (English) : MNSS Gene Frequencies in (Dr. T. E. Cleghorn), 701
Blood Glucose in the Rat adapted to a Fat Diet : An Inverse Relation between the Liver Glycogen and the (Dr. P. A. Mayes), 325
Blood Group A : Substance from Erythrocytes of (J. Kościelak and K. Zakrzewski), 516
Blood Group Antigen, Sw^{a} A 'New' Human (Dr. T. E. Cleghorn), *erratum*, 743
Blood-Group Antigens: Identification of, *review* by Dr. R. Drummond, 357
Blood-Pressure and Heart-Rate of Dogs : Effects of Ataractic Drugs on the (L. W. Hall and D. E. Stevenson), 696
Blood Serum and Urine of Cattle · Occurrence of Keto-Acids in, in comparison with Man, Horse, Sheep and Dog (Dr. C. J. G. van der Horst), 146
Bloodstains (Ageing) . Use of Reflectance Measurements in assessing the Colour Changes of (Dr. D. Patterson), 688
Blood-stains (Dried), on Fabrics : Absorption-Elution Grouping of (S. S. Kind), 789
Blood Supply (Tumour) : A Rapid Method for studying, using Lissamine Green (L. N. Owen), 795
Blood Thrombokinase : Chromatography of, on 'DEAE'-Cellulose (Dr. J. H. Milstone), 1127
Blood Transfusion (Japanese Red Cross Society eighth International Congress of), 201
Blood Transfusion (Oliver Memorial Fund Annual Award for work on), 201
Blood Uric Acid in Five Species of Birds : Variability in Levels of (Jack W. Hudson and Charles R. Taylor), 788
Blood Vessels of the Muscular Type : Visco-elastic Behaviour of (V. Hardung and Prof. L. Laszt), 330
Blow, W. H., and others : The American Oligocene, 679
Blue Hazes in the Atmosphere (Dr. F. W. Went), 641, *erratum*, 994
Blumenthal, Warren B. : The Chemical Behavior of Zirconium, *review* by Prof. A. G. Quarrell, 725
Blundell, Dr. . Self-Regulation in Living Systems (Tremor—The Tremor Problem from the point of view of the Surgeon, particularly in relation to Parkinson's Disease), 298
Blunt, Sir Anthony : At the sixty-sixth Annual Conference of the Museums Association (Purchase of Art Objects for Museums), 657
Board Industries (Pulp and), in Britain : Scope for Expanding (J. J. MacGregor, 32
Board Industries (Pulp and Particle) · The Development of, and their Effect on Forest Management (Society of Foresters of Great Britain Discussion on), 32
Boardman, G., and Whitmore, Dr. R. L. : Yield Stress exerted on a Body immersed in a Bingham Fluid, 50
Bockris, Dr. J. O'M. (Blomgren, Dr. E. A., and) · Simultaneous Measurement of Adsorption and Electrodekinetic Parameters at Metal Surfaces, 504
Bodies (Celestial) : Theories of Figures of (Wenceslas S. Jardetzky), *review* by Prof. L. S. Goddard, 890
Bodies (Small) : Dispersal in Space of (Dr. D. O. Wolfenbarger), 1078
Body Immersed in a Bingham Fluid · Yield Stress exerted on a (G. Boardman and Dr. R. L. Whitmore), 50
Body (Rigid) : Effect of a Resisting Couple on the Rotational Motion of a (T. Nonweiler), 311
Bohme, Prof. Horst : Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079
Bolis, L. (Del Vecchio, Prof. A., and) : Depressing Activity of Meprobamate on the Reticulo-Endothelial System, 513
Boll, W. G. (Lowther, R. L., and) : Ethionine and Plant Growth Systems, 831
Bollhagen, H., and others : Ionospheric Modification of the Radio Emission from Jupiter, 568
Bolton, Dr. A. : Appointed to a senior lectureship in civil engineering in the University of Liverpool, 117
Bombyx mori (Silkworm) : Function of the Corpus Allatum in 'Dauer-pupa' of the (Dr. Masatoshi Kobayashi), 346
  Nutritive Values of Carbohydrates for the (Dr. Toshio Ito), 527
Bond, T. J. (Byers, Jun., Ernest H., and) : Enzymatic Synthesis of Formylglutamic Acid by a Plant Protein, 416
Bond (Disulphide), in Wool . Reactivity of the (Dr. L. J. Wolfram and Prof. J. B. Speakman), 595
Bond (Valence-) Structures—a New Proposal (Dr. J. W. Linnett), 859
Bond-Strength (Cement-Aggregate) : Dependence of, on Size of Aggregate (K. M. Alexander and J. Wardlaw), 230
Bonding (Ionic-Covalent), in Crystals (C. H. L. Goodman), 590
Bone · Artificial Thickening of, and the Piltdown Skull (Prof. Ashley Montagu), 174 ; (Dr. Kenneth P. Oakley), 174
Bone (Human) : Radioactive and Natural Strontium in (J. W. Arden, F. J. Bryant, E. H. Henderson, G. D. Lloyd and A. G. Morton), 994
Bone Marrow Cells : Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Bone Marrow Cells (Transplanted), in Radiation Chimaeras : Identification of (P. Czerski, O. Rosiek and J. Sabliński), 955
Bone Marrow Depression in Murine Leukaemia (James T. Duhig), 71
Bones : Radioactivity of Soils, Plants and (Sir Ernest Marsden), 192
Bones from some Marine Mammals : Laminated Structure of (Dr. R. M. Laws), 338
Bonino, C., and others : Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238
Bonpland, A. (von Humboldt, Alexander, et) . Géographie des Plantes, facsimile edition (Society for the Bibliography of Natural History), 904
Book Publishing Record (American), 116
Book (Reference), of Theoretical Physics, *review* by Prof. R. Eisenschitz, 445
Book-buying Policy of the National Central Library (S. P. L. Filon), 992
Books . Recent Scientific and Technical, Supp. vi, July 30 ; Supp. iv, August 27 ; Supp. vi, September 24
  United States Record of Published, 116
Books (Low-priced), for Overseas, 741
Books and Dictionaries (Japanese Scientific and Technical) : A collection of, presented to the Science Museum Library, London, on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
Boons, Jean-Paul (Bertelson, Paul, and) : Time Uncertainty and Choice Reaction Time, 531
Booth, Dr. A. N., and others : Excretion of Catechol after Ingestion of Quinic and Shikimic Acids, 691
Bornstein, Dr. J., and Hyde, Deirdre : Polypeptides of the Human Pituitary with Direct Action on Metabolism, 125
Borough Road College, Isleworth : Grant of £50,000 from the Nuffield Foundation, for a new science block to be known as the Nuffield Science Building, 371
  Grant of £75,000 from the British and Foreign School Society, towards the general expansion of the College, 371
Borrmann Effect observed in an Aluminium Single Crystal (Koichi Nakajima and Prof. Shigeyasu Koda), 53
Bosch, L. Cytoplasmic Particles and their Role in Protein Synthesis (Metabolic Behaviour of Fractions obtained by Passing Ribonucleic Acid through a column of 'Ecteola' Resin), 644
Boswell, C. (Lofts, Dr. B., and) : Cyclical Changes in the Distribution of the Testis Lipids in the Common Frog, *Rana temporaria*, 708
Bosworth, Prof. T. J. : Title of professor emeritus of veterinary pathology in the University of London conferred on, 466
Botanic Gardens : Singapore, 1000
Botanic Gardens (Royal), Kew (F. Ballard), 119
Botanical Garden in Tashkent (F. N. Rusanov), 902
Botanical Materials : Alpha Activity of certain (Prof. W. V. Mayneord, R. C. Turner and J. M. Radley), 208
Botany at Adelaide, 740
Botany at St. Andrews, 1075
Bothrops jararaca Venom : Bradykinin-releasing Factor from (Dr. Olga B. Henriques, Mira Fichman and W. T. Beraldo), 414
Boudreau, Dr. F. R. : Elected an honorary member of the American Institute of Nutrition, 374
Bound Phosphate (High-Energy), and Diabetes Mellitus (Dr. Yoshio Goto, Isao Ito, Akihiko Kuwano and Yukio Ujiie), 702
Boundary Problems in Differential Equations—Proceedings of a Symposium conducted by the Mathematics Research Center of the United States Army at the University of Wisconsin, 1959 (edited by Prof. Rudolph E. Langer), *review* by Prof. E. T. Copson, 451
Bourne, Prof. G. H., and Danielli, Prof. J. F. (edited by) · International Review of Cytology, Vol. 8, *review* by the late Prof. J. Bronte Gatenby, 632
Bouvier, I., and others : A Polyploidizing Principle in the Spleen, 965
Bovaird, John (Lenhoff, Dr. Howard M., and) : Enzymatic Activation of a Hormone-like Response in *Hydra* by Proteases, 671
Bovine Antibody : N-Terminal Amino-Acids of (Elizabeth M. Press and R. R. Porter), 59
Bovine Pancreatic Ribonuclease A : Activity of, in Mixed Solvent Systems (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Bowen, Prof. E. G. · Welsh Emigration Overseas (Presidential Address to Section E (Geography) of the British Association for the Advancement of Science), 843
Bowen, Dr. E. J. (Purver, Margery, and) . The Beginning of the Royal Society, *review* by Dr. William P. D. Wightman, 356
Bowles, R., and others . Cage Effect in the Liquid-Phase Photolysis of Fluorinated Ketones, 314
Bowley, A. E. (Goldsmid, H. J., and) : Thermal Conduction in Mica along the Planes of Cleavage, 864
Boyd, Dr. G. S. Some Aspects of Atherosclerosis, *review*, 634
Boyd, Dr. R. L. F. : Grants for Space Research—£8,880 (for the development and use of photoelectric satellite tracking equipment, and £35,450 (for rocket research in the upper atmosphere of (1) atmospheric temperature, density and winds, (2) ionospheric temperature, density and composition, (3) short-wavelength solar radiation, and (4) stellar ultra-violet light), 744
Boyer, Prof. Samuel H., and Young, Dr. William J. · β-Globulin Polymorphism in Chimpanzees, 1035

Boyland, Prof. E. : Xenobiochemistry, *review*, 94
Boys (Charles Vernon) Prize Address to the Physical Society (Dr. D. West), 853
Brachet, Prof. J., and Olszewska, Dr. M. J. : Influence of Localized Ultra-violet Irradiation on the Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea*, 954
Brackish Water Areas (Danish) : The Oligochaeta Fauna of Three (Ingerlise Dahl), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A. J. Southward, 360
Bradbury, E. M., and others : Screw Sense of the α-Helix in Poly-β-benzyl-L-aspartate, 321
Bradley, D. E. : Direct Observation of Surface Contamination formed in Demountable Vacuum Systems, 227
Bradley, Dr. O. Charnock : Topographical Anatomy of the Dog, sixth edition, revised by Prof. Tom Grahame, *review* by Prof. T. Nicol, 451
Bradley, James C. : Appointed assistant secretary (management) of the Smithsonian Institution, 743
Bradykinin : Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-L-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to (E. D. Nicolaides, H. A. DeWald, Patricia G. Shorley and Dr. H. O. J. Collier), 773
Bradykinin-releasing Factor from *Bothrops jararaca* Venom (Dr. Olga B. Henriques, Mina Fichman and W. T. Beraldo), 414
Brain : Vol. 83, Part 1, 28
Brain : Effect of Potassium Cyanide Poisoning on the γ-Aminobutyric Acid Level in the (Dr. T. Tursky), 322
  A Suggested Effect on Levels of Catecholamine in, produced by Small Doses of Reserpine (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Brain and Behaviour, *review* by Dr. Henry Miller, 6
Brain Metabolism : Isolation and Probable Functions of Betaine Esters in (Prof. E. A. Hosein and Peter Proulx), 321
Brain of the Rat : Strain Differences in Acetylcholine Concentration in the (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Brandly, C. A., and Jungherr, E. L. (edited by) : Advances in Veterinary Science, Vol. 5, *review* by Prof. H. Burrow, 448
Branigan, William J., and others : Production of Tumours in *Rattus (Mastomys) natalensis* by Polyoma Virus, 423
Brassica oleracea L. : Biogenesis of Ascorbigen, 3-Indolylacetonitrile and Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in (Dr. M. Kutáček, Dr. Z. Procházka and Dr. D. Grunberger), 61
Brasted, Prof. Robert C. (Klug, Harold P., and) : The Elements and Compounds of Group IVA (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed and Prof. Robert C. Brasted, Vol. 7), *review* by Dr. K. W. Bagnall, 185
Brasted, Prof. Robert C. (edited by Prof. M. Cannon Sneed and) : Comprehensive Inorganic Chemistry, Vol. 7, The Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), *review* by Dr. K. W. Bagnall, 185
Braveny, Dr. P. (Kruta, Dr. V., and) : Potentiation of Contractility in the Heart Muscle of the Rat and some other Mammals, 327
Brawerman, Dr. George, and others : A Bleached Variant of *Euglena gracilis* showing a Doubling of the Content of Deoxyribonucleic Acid, 1037
Bray, K. N. C. : Combustion and Propulsion—High Mach Number Air-breathing Engines (Non-equilibrium Flows through Supersonic Nozzles and Shock-waves), 20
Brazier, Mary A. B. (edited by) : The Central Nervous System and Behavior—Transactions of the Second Conference, Princeton, 1959, *review* by Dr. Henry Miller, 6
Bread Research Institute Laboratories (Australian), 291
Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Breeding (Experimental), of *Anopheles gambiae* Giles in Papyrus Swamps (L. K. H. Goma), 1137
Breeding (Fruit), and Genetics to 1955 : Abstract Bibliography of—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Breeding (Plant) : The Two R's of, *review* by Dr. G. Haskell, 184
Breeding Plumage of the Weaver Finch, *Quelea quelea* : Effects of Whole-body Irradiation on the (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Breeding Sites on Non-Cichlid Fishes in Lake Victoria (Dr. Philip S. Corbet), 616
Bremaud, O., and Pagot, J. : Problems of the Arid Zones (Nomadism in relation to Grazing Resources—Moving of Flocks in the Sahelian Zone), 296
Brickwedde, F. C., and others : The Helium-4 Scale of Temperature, 1077
Bridging the Gap between Science and Christianity, *review* by R. Brightman, 818
Briggs, Dr. B. H. : Roughness of the Moon as a Radar Reflector, 466, 490
Briggs, Prof. George M. : Appointed chairman of the Department of Nutrition in the College of Agriculture at the University of California, Berkeley, 290
Briggs, M. H : Vitamin and Coenzyme Content of Hepatomas induced by Butter Yellow, 249
  Origin of the Solar System, 1102
Brightman, R. : Control of Scientific Research in the United States, *review*, 181
  Guide to Reference Material, *review*, 273
  Bridging the Gap between Science and Christianity, *review*, 818
Brinck, Per, and others (edited by) : South African Animal Life—Results of the Lund University Expedition in 1950-1951, Vol. 6, *review* by H. Oldroyd, 1063
Brinkley, T. A. (Titterton, Prof. E. W., and) : Rare Modes in the Spontaneous Fission of Californium-252, 228
Brinton, Dr. D. H. : Recent American Research in Neuropsychiatry, *review*, 447
Britain : The Decimal System in, 30
  Food Habits in (Scottish Group of the Nutrition Society Symposium on), 905
  Geological Results of Petroleum Exploration in, by the British Petroleum Company during the Years 1945-57 (N. L. Falcon and P. E. Kent), 1078
  Industrial Health in, 648
  Management in—a General Characterization (I. McGivering, D. G. J. Matthews and W. H. Scott), 537
  A North American Xanthoid Crab New to (E. Naylor), 256
  Science and Education in, 906
  Scope for Expanding Pulp and Board Industries in (J. J MacGregor), 32
  Search for Oil in, 1078
  Space Research in—Grants, 744
  University Education in, 719
  See also under Great Britain
British Agricultural Policy : Principles for—a Study sponsored by the Nuffield Foundation (edited by H. T. Williams), *review* by Sir John Russell, 721
British Agriculture : Future of, *review* by Sir John Russell, 721
British Analogue Computer : A New, the *Radic* (The Redifon Company), 288
British Association for the Advancement of Science : Cardiff Meeting, 646, 837
  Presidential Address, The Two Aspects of Science (Sir George Thomson), 837
  Summaries of Addresses of Presidents of Sections, 841
  Presidential Address to Section A (Mathematics and Physics), Stellar Motions (Dr. R. v. d. R. Woolley), 841
  Presidential Address to Section B (Chemistry), Chemistry is Not Enough (Dr. James Taylor), 841
  Presidential Address to Section C (Geology), Pleistocene History of the Irish Sea (G. F. Mitchell), 842
  Presidential Address to Section D (Zoology), Tropical Climates and Biology (Dr. G. S. Carter), 843
  Presidential Address to Section E (Geography), Welsh Emigration Overseas (Prof. E. G. Bowen), 843
  Presidential Address to Section F (Economics), Monetary Thought and Monetary Policy in England (Prof. R. S. Sayers), 844
  Presidential Address to Section G (Engineering), Statics and the Engineer (Sir Alfred Pugsley), 844
  Presidential Address to Section H (Anthropology), The Peasant and the Past (Prof. Estyn Evans), 844
  Presidential Address to Section I (Physiology and Biochemistry), The Physiology of Hearing (Prof. W. Burns), 845
  Presidential Address to Section J (Psychology), Experiment in Psychology—a Centenary and an Outlook (Prof. R. C. Oldfield), 846
  Presidential Address to Section K (Botany), Origin of Angiosperms (Prof. T. M. Harris), 847
  Presidential Address to Section K* (Forestry), The Dangerous Concept of the Natural Forest (T R. Peace), 848
  Presidential Address to Section L (Education), Sixty Years of Progress in English Education (Prof. H. C. Dent), 848
  Presidential Address to Section M (Agriculture), Pastoral Systems in relation to World Food Supplies (Dr. William Davies), 849
  Presidential Address to Section N (Sociology), Population Growth, Fertility and Population Policy (Prof. D. V. Glass), 849
  Presidential Address to Section X (Assembly of Corresponding Societies), Science Broadcasting in Sound and Television (A. B. Oldfield Davies), 850
  Election of Sir Wilfrid Le Gros Clark as president for 1961, 852
  Section M (Agriculture) : Discussion on Food and Animal Production Overseas, 1070
British Association for the Advancement of Science and the Association of British Chambers of Commerce : Decimal Coinage and the Metric System—Should Britain Change ? (A joint Report of Committees appointed by the), 30
British Association for the Advancement of Science (Biochemical Society and the) : Colloquium on the Organization and Financing of Research in Biochemistry and Allied Sciences, 650
British Association of Corrosion Engineers : Elected a member of the European Federation of Corrosion, 25
British Biophysical Society : Formation of the, 559
British Broadcasting Corporation : Television Field Trials of 405-Line and 625-Line Systems in the UHF and VHF Bands (1957-1958), 288
  The Reith Lectures, 1959 (Prof. P. B. Medawar,) *review* by Dr. J. D. Nisbet, 446
  The Second BBC Naturalist (edited by Desmond Hawkins), *review* by B. J. G Marchand, 728
British Chambers of Commerce, Association of (British Association for the Advancement of Science and the) : Decimal Coinage and the Metric System—Should Britain Change ? (A joint Report of Committees appointed by the), 30
British Chemical Manufacturers, Association of : Booklet on Chemical Plant Instrumentation—some Notes on the Use of Measuring Instruments, 1079
British Colonial Territories, 906
British Commonwealth : Plant Pathology in the (Dr. G. C. Ainsworth), 834
British Computer Society : Second Annual Conference (Dr. L. Fox), 655
British Congress on the History of Medicine and Pharmacy : First (Faculty of the History of Medicine and Pharmacy of the Worshipful Society of Apothecaries of London, in co-operation with the Royal College of Physicians, the Royal College of Surgeons of England and the Royal Society of Medicine), 374
British Council · Course on the Non-destructive Testing of Materials, 1079
British Defence Research and Development, 177
British Electrical Power Convention : Presidential Address, Electricity—the New Horizon (Viscount Chandos), 557, 831
British Embassy in Buenos Aires : Appointment of A. G. Mill as agricultural and food attaché, 1075
British Film Institute : National Film Archive Catalogue, Part 2, Silent Non-Fiction Films (1895-1934), 199
British Gelatine and Glue Research Association : Nineteenth Meeting of the Research Panel, 998
British Hydromechanics Research Association : Twelfth Annual Report (1958-59), 26
British Institute of Management (South London Committee) : Conference on Research Necessary for the Preparation and Use of Case Studies, 660
British Institution of Radio Engineers : Report on the Education and Training of the Professional Radio and Electronics Engineer, 115

British Journals and Newspapers : Bibliography of, 116
British Leather Manufacturers' Research Association : Special Assistance for Effluent Liaison, 992
British Men of Science, a New Series to be published by Nelson, 374
British Museum (Natural History) : Bulletin, Historical Series, Vol. 2, No. 3, Darwin's Notebooks on Transmutation of Species (edited by Sir Gavin de Beer), Part 2, 26
  Bulletin, Historical Series, Vol. 2, No 4, Darwin's Notebooks on Transmutation of Species (edited by Sir Gavin de Beer), Part 3, 649
British Odonata · A New Study of the, *review* by Dr D E. Kimmins, 631
British Parchments · Follicle Remains in some (Dr M. L. Ryder), 130
British Petroleum Company Geological Results of Petroleum Exploration in Britain by the, during the Years 1945-57 (N. L. Falcon and P. E. Kent), 1078
British Pharmaceutical Conference : Ninety-seventh Meeting, 117
British Pharmaceutical Industry, Association of the : Report on the Use of Gamma-Radiation Sources for the Sterilization of Pharmaceutical Products, 903
British Poultry Science, Vol. 1, No 1, 465
British Pteridological Society : Work of the, 902
British Rayon Research Association Open Days (L. A Wiseman), 121
British Society for the Philosophy of Science ; Fifth Annual Conference, 559
British Society of Rheology Discussion on Rheology of Polymers, 290
British Soils : Potassium-supplying Power of some (Dr. P. W. Arnold), 436
British Steel Castings Research Association Open Days (Dr. A. H. Sully), 657
  Seventh Annual Report, 658
British Universities : Graduate Schools in (Prof. W. R. Niblett), 560
British Weed Control Council : Symposium on Herbicides and the Soil, 376
British and Foreign School Society : Grant of £75,000 towards the general expansion of the Borough Road College, Isleworth, 371
Broad Bean : Radiation and the, *review*, 8
Broadcasting in Great Britain · Future of, 1076
Broadcasting Corporation, South African : Van Riebeeck Lectures, Africa's Place in the Emergence of Civilization (Prof Raymond A. Dart), *review* by M. C Burkitt, 891
Broadcasting (Science), in Sound and Television (A. B. Oldfield Davies), 850
Broads : The Making of the (Dr. J. M. Lambert, J. N. Jennings, C. T. Smith, Charles Green and J. N. Hutchinson), *review* by Miles Burkitt, 636
Brockington, Prof. Fraser : World Health, *review* by Christine Cockburn, 722
Brockmann, Prof. H : The Chemistry of Natural Products (Chemistry of the Actinomycins), 1080
Brodie, Dr. Bernard B. (Orlans, F. Barbara, and) : A Suggested Effect on Levels of Catecholamine in Brain produced by Small Doses of Reserpine, 1034
Brodsky, K. A , and others : Work of the Antarctic Expeditions of the Academy of Sciences of the U.S.S.R., 287
Broken Hill Proprietary Company · Grant of £6,000 to support tinplate research in the Australian Commonwealth Scientific and Industrial Research Organization, 904
Bromfield, Dr. S. M. : Given an Award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 291
Bromide (Urea-Ammonium) : Mimetic Twinning in (C. G. C. Catesby), 765
Bronowski, Dr. J , with Sir Gerald Barry, James Fisher and Sir Julian Huxley (editorial board) : Science—Chemistry, Physics, Astronomy, *review* by Dr D. R. Dickinson, 978
Brooker, R. : At the second Annual Conference of the British Computer Society (A Common Computer Language), 655
Brooks, A. E : Australian Native Plants for Home Gardens, *review* by Dr. R. Melville, 637
Brooks, Dr. S. A., and others · Phosphate Esters produced by Mammalian Skin from 2-Deoxy-D-Glucose, 1028
Brosset, Prof. Cyrill, and Magnusson, Bengt: The Silicon–Boron System, 54
Brown, A., and others · An Improvement in the Ductility of Beryllium at High Temperatures, 494
Brown, A C. (Krugman, Prof. B J., and) : 'Water Rigour' as an Aid when Operating on Marine Gastropoda, 69
Brown, Dr. A. M., and Gascoigne, Dr. J. A. : Biosynthesis of Cellulose by *Acetobacter acetigenum*, 1010
Brown, F., and Steward, Doreen L. : Infective Ribonucleic Acid from the Viruses of Talfan and Teschen Diseases, 714
Brown, Dr. J. E : Appointed a senior lecturer in engineering at the University of Leicester, 743
Brown, Prof J. H. U. : Specific Inhibitors of the Adrenal Cortex, 985
Brown, R. A., and others : Reversible Dissociation of Ribonucleic Acid, 509
Brown, Ltd , Constructors John, and the Institution of Chemical Engineers : A CJB Scholarship awarded to M. D. Taylor, 650
Brown Alga (Australian), *Notheia anomala* : Structure and Systematic Position of the (M. Nizamuddin and Dr. H. B. S. Womersley), 673
Brown Mutation : Occurrence of a, in the Syrian Hamster (Roy Robinson), 170
Brownbridge, N. : Herbicides and the Soil (Microbiological Breakdown of Herbicides in Soils), 377
Brownlee, G., and others : Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the Reticulo-Endothelial System, 1032
Bruce, Dr. C. E. R. : Temperatures reached in Electrical Discharges in the Solar Atmosphere, 865
Brummer, B. : Awarded a Senior Studentship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Brun, Prof. E. A. · Elected a Foreign Associate of the United States National Academy of Sciences, 198
Brunt, A. A., and Wharton, A. L. : Transmission of a Gall Disease of Cocoa, 80
Brunton, Dr J. H. : Appointed by the Committee of the Royal Society and the Armourer and Brasiers' Company to the Armourer and Brasiers' Research Fellowship at the Laboratory for the Physics and Chemistry of Solids, Cavendish Laboratory, Cambridge, 291
Bruun, Dr. Anton, and others (edited by) : Galathea Report—Scientific Results of the Danish Deep-Sea Expedition round the World, 1950-52, *review* by Dr. N. B. Marshall, 443
Bryant, F. J , and others : Radioactive and Natural Strontium in Human Bone (Atomic Energy Research Establishment, *R23246*), 994
Bryophyllum Leaves (Excised) : Effects of Light and Darkness on the Rhythm of Output of Carbon Dioxide of (Dr. Malcolm B. Wilkins), 523
Buchan, Alastair : NATO in the 1960's—the Implications of Interdependence, 179
Buckingham, R : At the second Annual Conference of the British Computer Society (Organization of Computing Centres in Universities), 656
Budden, Dr. K. G. : Grant of £1,694 for Space Research (research into the theory of propagation of radiations from artificial satellites), 744
Buerger, Prof Martin J. : Vector Space and its Application in Crystal-Structure Investigation, *review* by Dr. J. W Jeffery, 975
Builder, Dr. Geoffrey : *Obituary* by Sir Edward Appleton, 828
Building Research Station : Digest 133, Domestic Heating and Thermal Insulation, 999
  Factory Building Studies No. 6, Noise in Factories (A. G Aldersey-Williams), 1085
Bull, G. A. : Climatic Atlas of the Czechoslovak Republic, *review*, 543
Bull Spermatozoa : Effect of Acridine Orange on Living (C. van Duijn, Jun.), 1006
Bulleid, M J., and others : Recapture in the River Tweed of a Sea-Trout marked in Devonshire, 877
Buller, A. J : Appointed reader in physiology at King's College, London, 466
Bullock, A. A. : Flora of the Zambesi Basin, *review*, 449
Bunge, Prof Mario Causality, *review* by Dr. J. O. Wisdom, 92
Burch, Dr. C. R. : Aspheric Imaging Systems (Parsons Memorial Lecture of the Physical Society), 854
Burchfield, Dr. H. P., and Storrs, Eleanor E. : An Ortho Effect influencing Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin, 593
Burchfield, Dr. H. P (Staples, Dr Richard C., and) · Incorporation of Acetate into Protein by Obligately Parasitic and Saprophytic Fungi, 1040
Burgess, Dr. R. C. Elected an honorary member of the American Institute of Nutrition, 374
Burgess, Prof. R. E., and others (edited by) : Progress in Semiconductors, Vol 4, *review* by Dr. J R. Tillman, 185
Burhop, Dr. E. H. S · Title of professor of physics in the University of London (at University College) conferred on, 201
Burkitt, M C Prehistoric India, *review*, 94
  The Making of the Broads, *review*, 636
  Prehistoric Man in Europe, *review*, 729
  Africa's Place in the Emergence of Civilization, *review*, 891
  North African Prehistory, *review*, 1062
Burn, Robert · Australian Bivalve Gastropods, 44
Burnet, Sir Macfarlane, and Warner, N. L. . Assay of Corticosteroids in the Chick Embryo, 938
Burns, Dr. B. D. : Self-Regulation in Living Systems (Tremor—Physiology of the Basic Causal Loop), 297
Burns, Prof B. Delisle (Smith, G. K., and) · A Biological Interval Analyser, 512
Burns, Prof W. : The Physiology of Hearing (Presidential Address to Section I (Physiology and Biochemistry) of the British Association for the Advancement of Science), 845
Burnstock, G , and Holman, Mollie E. : Autonomic Nerve–Smooth Muscle Transmission, 951
Burridge, Dr. K. O. L. : A Mythical Science, *review*, 7
Burrow, Prof. H . Advances in Veterinary Science, *review*, 448
Bursaries Scheme (Commonwealth), (Royal Society and Nuffield Foundation) : Awards, 291
Bursell, E. : Free Amino-Acids of the Tsetse Fly (*Glossina*), 778
Burton, L. K , and others : Radiostrontium and Radiocaesium in Milk during 1959, 108
  Comparison of Fission Product and Beryllium-7 Concentrations in the Atmosphere, 550
Bush, Dr. I. · Influence of Editors, 121
Bush, Dr. I. E Appointed to the Bowman chair of physiology, and to the directorship of the Department of Physiology, in the University of Birmingham, 465
Butenandt, Prof Adolf Elected an honorary member of the Leopoldina Academy of Science, 117
Butler, Bera G. (Butler, G. W., and) · Biosynthesis of Linamarin and Lotaustralin in White Clover, 780
Butler, G. W., and Butler, Bera G. · Biosynthesis of Linamarin and Lotaustralin in White Clover, 780
Butler, Prof. J. A. V. : Colloid and Polymer Science (Flow Properties of Dilute Solutions of Deoxyribonucleic Acid in 0 2 *N* Sodium Chloride), 378
Butler, Prof. J. A. V. (Cohn, Dr. P., and) : Cytoplasmic Particles and their Role in Protein Synthesis (Composition of Ribonucleoprotein Fractions from the Microsomes of Rat Liver), 645
Butter Yellow : Vitamin and Coenzyme Content of Hepatomas induced by (M H. Briggs), 249
Butterworth, D , and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Butterworth, Dr. K. R., and Mann, Dr Monica : Proportion of Noradrenaline to Adrenaline in the Adrenal Glands of Litter-mate Cats, 785
n-Butyllithium Initiator : Homogeneous Synthesis of Isotactic Polystyrene using (Dr R. J. Kern), 410
Butyrate (Sodium) : Reduction of the Intestinal Absorption of Glucose, Methionine and, by the Cation Trimethylhexadecylammonium (Dr J. A. Nissim), 308
Byers, Jun., Ernest H., and Bond, T. J. : Enzymatic Synthesis of Formylglutamic Acid by a Plant Protein, 416
Byrd Station, Antarctica : Association between Aurorae and Very Low-Frequency Hiss observed at (Dr. L. H. Martin Dr. R. A. Helliwell and K. R. Marks), 751
Byssus (Anterior) Retractor Muscle of *Mytilus edulis* : The Membrane Potential of the (Dr D. H. Paul), 1121

CADMAN, C. H., and others : Sap-Transmissible Viruses associated with Diseases of Grape Vines in Europe and North America, 577
Cadmium and other Metals : An Abnormal Serum Protein in Experimental Poisoning by (D. J. Lawford), 946
Caesium (Fall-out), in Surface Sea Water off the California Coast (1959-60) by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Caesium-137 and (Zirconium+Niobium)-95 in Swedish Soils : Content of (Kerstin Low and K. Edvarson), 736
Caesium-controlled Oscillators : The 'GBR Experiment'—a Trans-Atlantic Frequency Comparison between (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Cage Effect in the Liquid-Phase Photolysis of Fluorinated Ketones (R. Bowles, Dr. J. R. Majer and Prof. J. C. Robb), 314
Cain, Dr. A. J. : Microbial Systematics, 191
Calcium : Effect of Anti-Diuretic Hormone and, on the Equivalent Pore Radius of Kidney Slices from *Necturus* (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Calcium-deficient Muscles : Restoration of Membrane Excitability of, by Anodal Polarization (Prof. K. Koketsu and K. Noda), 243
Calcium and Citric Acid in the Oviduct of the Hen : Parallel Distribution of (Dr. T. G. Taylor and F. Hertelendy), 244
Calderbank, Dr. P. H. : Appointed to the chair of chemical technology in the University of Edinburgh, 555 ; work of, 555
Caldwell, Dr. P. C. : Appointed lecturer in biochemistry within the Department of Zoology in the University of Bristol, 465
Calf Thymus Nuclei : Water-soluble, Non-fibrous Deoxyribonucleoprotein from (Dr. Richard S. Walsh), 943
California Coast (1959-60) : Fall-out Caesium in Surface Sea Water off the, by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Californium-252 : Rare Modes in the Spontaneous Fission of (Prof. E. W. Titterton and T. A. Brinkley), 228
Callingham, R. S. H. : Elected Master for 1960-61 of the Salters' Company, 29
Callow, Dr. R. K. : Influence of Editors, 121
Camber, Dr. Bernard : Oxosteroids—the Use of Hydrazides for Detection, Characterization and Estimation, *review* by Prof. G. A. D. Haslewood, 183
Calyptraeidae : Protandry and Self-Fertilization in the (Dr. H. V. Wyatt), 520
Cambrian : Age of the Base of the (Dr. G. W. Wetherill), 34 ; (Prof. Arthur Holmes), 35
Cambrian System : Age of the (Prof. C. F. Davidson), 1020
Camellia sinensis : Foliar Application of Nutrients and Rhizosphere Microflora of (Dr. C. S. Venkata Ram), 621
Cameron, Dr. D. A. : New Laboratories of the Australian Bread Research Institute opened by, 291
Cameron-Wood, J., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Campbell, Bruce (descriptions by) : Birds in Colour (illustrated by Karl Aage Tinggaard), *review* by B. J. G. Maitland, 273
Campbell, Dr. F. W., and Gregory, Dr. A. H. : Effect of Size of Pupil on Visual Acuity, 1121
Campbell, Dr. Joseph : The Masks of God—Primitive Mythology, *review* by Dr. K. O. L. Burridge, 7
Campbell, R. B., and others : Growth of Sulphide Films on Steel, 588
Canadian High Polymer Forum : Tenth (National Research Council of Canada and the Chemical Institute of Canada), 117
Canal (Anal) : Sensory Innervation of the (R. P. Gould), 337
Cancer of the Lung : Epidemiology of (United Nations, World Health Organization, Technical Report Series No. 192), 115
Cancer Hospital (Royal), London : Appointment of E. J. Ambrose to the University of London readership in physical chemistry at the Institute of Cancer Research, 904
  Title of reader in chemistry in the University of London conferred on G. M. Timmis, 904
Candida albicans : Effect of, on the Evolution of Experimental Tuberculosis (Dr. E. Mankiewicz and Dr. M. Livak), 250
Cannon, P. (Phillips, V. A., and) : Dislocations in Layer Structures, 313
Capacity of Extracts from Prestarved *Escherichia coli* to Incorporate Thymidine into Deoxyribonucleic Acid (Dr. Daniel Billen), 1044
Capacity (Proliferative), of Acute Leukaemia Cells (Dr. Felice Gavosto, Giovanni Maraini and Alessandro Pileri), 611
Capacity (Total Iron-binding), in certain Mammals : Serum Iron and (Prof. Jose Planas and Sannio de Castro), 1126
Cape and Royal Greenwich Observatories : Integration of the, 464
Capital Investment in the Coal, Electricity and Gas Industries (Ministry of Power), 1055
Capot-Rey, Prof. R. E. : Problems of the Arid Zones (Nomadism in relation to Grazing Resources—the Sahara and the Sahel), 296
Capsule (Kidney) : Development of Mouse Eggs beneath the (D. R. S. Kirby), 707
Capsules from *Discoverer* Satellites : Recovery of, 741
Carbide : An Iron-Silicon (J. G. Humphreys and Prof. Walter S. Owen), 589
Carbohydrates : Nutritive Values of, for the Silkworm, *Bombyx mori* (Dr. Toshio Ito), 527
Carbohydrates of *Ecklonia radiata* (C. M. Stewart and H. G. Higgins), 511
Carbohydrates (Neutral) : Presence of, in Human Aortic Tissue (Dr. Sv. Bertelsen), 411
C-1 Fructose-1,6-diphosphatase : Alkaline—Evidence for its Participation in Photosynthesis (Dr. Robert Smillie), 1024
C^3-C^6 Hydrocarbons : Two Highly Selective Solvents for Gas-Liquid Chromatography Analysis of (Dr. A. van der Wiel), 142
Carbon(III)Ion (*tris*(Ethylenediamine)) : Catalytic Racemization of (Dr. F. P. Dwyer and Dr. A. M. Sargeson), 1022
Carbon-14 Labelled Hybrids of Haemoglobin (Dr. Jerome Vinograd and William D. Hutchinson), 216
^{14}C-Lysine Metabolism in Young Rats : Influence of Different Types of Malnutrition on the (Prof. Kurt Schreier and Corinna Kassens), 1117
^{14}C-Meso-Inositol in the Rat : Metabolism of (Dr. D. A. Nixon), 77
Carbon Dioxide : Effects of Light and Darkness on the Rhythm of Output of, of Excised *Bryophyllum* Leaves (Dr. Malcolm B. Wilkins), 523
Carbon Dioxide Mass Spectra : High-Energy Oxygen Ions in (R. M. S. Hall), 683
Carbon Dioxide Output : Effect of Electronarcosis on Oxygen Consumption and (Dr. Jaroslav Strmiska and Dr. Antonín Vacek), 151
Carbon-Fluorine Compounds in some Species of *Dichapetalum* : Fluorine Compounds in Nature—the Distribution of (Sir Rudolph Peters and R. J. Hall), 573
CF_2 Radical : Photochemical Formation and Stability of the (Dr. J. P. Simons and A. J. Yarwood), 316
Carbon Monoxide-sensitive Respiration : Absence of, in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin (Hanna Engelberg and Dr. M. Artman), 801
Carbons of Different Graphitic Perfection : Dependence on Temperature of the Interlayer Spacing in (E. G. Steward, B. P. Cook and E. A. Kellett), 1015
Carcinus maenas (L.) (Shore Crab) : Albinism in the American Population of the (Anthony J. Provenzano, Jun.), 521
Cardiff Region : The—a Survey (Chairman of the Editorial Committee, Sir J. Frederick Rees), (prepared for the meeting of the British Association in Cardiff), *review*, 851
Cardini, Dr. Carlos E., and others : Mechanism of Starch Biosynthesis, 918
Carlisle, Dr. D. B. : Softening Chitin for Histology, 1132
Carnap, Rudolf : Introduction to Symbolic Logic and its Applications (translated by William H. Meyer and John Wilkinson), *review* by F. I. G. Rawlins, 729
Carnegie United Kingdom Trust : Forty-sixth Annual Report (1959), 566
Carr, T. D., and others : Ionospheric Modification of the Radio Emission from Jupiter, 568
Carter, Dr. G. S. : Tropical Climates and Biology (Presidential Address to Section D (Zoology) of the British Association for the Advancement of Science), 843
Cartwright, K. St. G., and Findlay, W. P. K. : Decay of Timber and its Prevention, *review* by Prof. F. W. Jane, 977
Case, L. C. (Schmoyer, L. F., and) : A New Method for the Synthesis of Cyclic Ethers, 592
Case Studies : Research in, 659
  Research Necessary for the Preparation and Use of (South London Committee of the British Institute of Management Conference on), 660
Casey-Smith, J. R. : Haematology of the Central Australian Aborigine, 903
Cassie, R. M. : Abundance of Marine Plankton, 289
Castner Memorial Lecture (Dr. W. J. Kroll), 994
Catalase-like Activity in Lactic Acid Bacteria : Two Types of (R. Whittenbury), 433, *erratum*, 466
Catalytic Racemization of *tris*(Ethylenediamine)Cobalt(III) Ion (Dr. F. P. Dwyer and Dr. A. M. Sargeson), 1022
Catechol : Excretion of, after Ingestion of Quinic and Shikimic Acids (Dr. A. N. Booth, D. J. Robbins, M. S. Masri and F. DeEds), 691
Catecholamine in Brain : A Suggested Effect on Levels of, produced by Small Doses of Reserpine (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Catecholamine Content (Nucleotide and), of the Denervated Adrenal Medulla of the Rat : Effect of Reserpine on the (Prof. Nils-Åke Hillarp), 1032
Catesby, C. G. C. : Mimetic Twinning in Urea-Ammonium Bromide, 765
Cathala, Prof. J. : *Obituary* of Georges Claude, 829
Cathode (Cold-) Arcs : Stepwise Ablation and Heat Transfer in (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Cation Trimethylhexadecylammonium : Reduction of the Intestinal Absorption of Glucose, Methionine and Sodium Butyrate by the (Dr. J. A. Nissim), 308
Cations of the Lyotropic Series : Effect of the, on the Tension of Vascular Muscle (Prof. L. Laszt), 329
Cats on Diets of varying Protein Content : Urinary Amino-Acid Pattern of (Dr. J. P. Greaves and Dr. Patricia P. Scott), 242
Cats (Litter-mate) : Proportion of Noradrenaline to Adrenaline in the Adrenal Glands of (Dr. K. R. Butterworth and Dr. Monica Mann), 785
Cattle : Occurrence of Keto-Acids in Blood Serum and Urine of, in comparison with Man, Horse, Sheep and Dog (Dr. C. J. G. van der Horst), 146
Causality (Prof. Mario Bunge), *review* by Dr. J. O. Wisdom, 92
Causation and Modern Science, *review* by Dr. J. O. Wisdom, 92
Cawood, Dr. W. : Combustion and Propulsion—High Mach Number Air-breathing Engines, 18
Celestial Bodies : Theories of Figures of (Wenceslas S. Jardetzky), *review* by Prof. L. S. Goddard, 890
Cell (Amphibian Neural Crest) : Pterin Synthesis in the (Tadao Hama and Masataka Obika), 326
Cell (Diaphragm-) Technique : Equations for Determining Diffusion Coefficients in Liquid Systems by the (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Cell (Epidermal), in an Insect : The Control of Growth and Form—a Study of the (Prof. V. B. Wigglesworth), *review* by Prof. R. Dennell, 631
Cell (Fuel) Low-Temperature (Shell Research Centre), 994
Cell Biology, American Society for : Organization of the, 649
Cell Biology and Growth Inhibition (Cell Biology Programme of Unesco International Symposium on), 836
Cell Culture Genetics of Man : Cytology and (Symposium published by the *American Journal of Human Genetics*), 116
Cell Division. Growth by, in Insect Tissue Culture (Dr. B. M. Jones and L. Cunningham), 1072
Cell Envelope of *Serratia marcescens* (*Chromobacterium prodigiosum*) : Association of Pigment with the (Mira Purkayastha and Prof. R. P. Williams), 349
Cell Membrane (Red Blood) : Chemical Constitution of the (Dr. T. Fehér and Dr. Béla Matkovics), 701
Cell Nuclei (Somatic) : Absorbance of Feulgen-stained (Dr. Simon Iversen), 86
Cell Nucleus : Selective Cytochemical Demonstration of Arginine Groups in Nucleoprotein in the (Dr. E. A. Barnard and Dr. L. G. E. Bell), 508
Cell Water (Mitochondrial and) : Phosphoproteins and (Dr. J. D. Judah), 506
Cell, Organism and Milieu (edited by Prof. Dorothea Rudnick), (Seventeenth Symposium of the Society for the Study of Development and Growth), *review* by Dr. E. N. Willmer, 650

Cellobiose and other Saccharides (Glucose,) : Synthesis of, by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium (Dr. C. P. Jackson and K. Ramamurti), 942
Cells : Uptake of Heparin by (Dr. G Csaba and Dr. Eszter Kapa), 711
Cells and their Environment, *review* by Dr. E. N. Willmer, 450
Cells of *Agrobacterium tumefaciens* : A Vacuolar System in, as shown by Electron Microscopy of Ultra-thin Sections (Miguel-Rubio-Huertos and Paul R. Desjardins), 1043
Cells (Acute Leukaemia) : Proliferative Capacity of (Dr. Felice Gavosto, Giovanni Maraini and Alessandro Pileri), 6[illegible]
Cells (Ascites Tumour), *in vitro* : Optical Protein Synthesis by (Dr. M. J. Fraser), 1114
Cells (Bone Marrow) : Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Cells (Chick Embryo Fibroblast) : An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected (Dr. J. Vilček), 73
Cells (Homologous Adult Spleen), injected into New-born Mice : Fate of (A. J. S. Davies and Sheila M A. Doak), 610
Cells (Human Red) : Adenosine Triphosphate and Maintenance of Shape of the (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Cells (Isolated) : Measuring the Size of (Dr. Samuel S. Epstein and Jacqueline B. Weiss), 461
Cells (Mast), and 5-Hydroxytryptamine in Precancerous Mouse Skin (Dr. R. E. Coupland and Dr. J. F. Riley), 1128
Cells (Mouse Ascites) : Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in (Dr A. R. Crathorn and Dr. K. V. Shooter), 614
Cells (*L*1210 Mouse Leukaemia) · Effect of 6-Mercaptopurine on the Net *in vitro* Gas Production of Sensitive and Resistant (Dr. H. J. Woodliff), 156
Cells (Transplanted Bone Marrow), in Radiation Chimaeras : Identification of (P. Czerski, O. Rosiek and J. Sabliński), 955
Cellular Fractions (Active) : Homotransplant Antigens—Preparation of (L. T. Mann, jun., J. M. Corson and Prof. G. J. Dammin), 774
Cellular Level : Analysis of Metabolic Rates at the (Dr. L. G. Lajtha, R. Oliver, R. J. Berry and Elizabeth Hall), 919
Cellulase of *Myrothecium verrucaria* : Evidence for Multiple Nature of (P. Y. F. Prins-van der Meulen and G. J. Schuringa), 695
Cellulose · Biosynthesis of, by *Acetobacter acetigenum* (Dr. A. M. Brown and Dr. J. A. Gascoigne), 1010
Cellulose (Animal) · Human and other (Dr. D. A. Hall and H. Saxl), 547
Cellulose ('DEAE'-) : Chromatography of Blood Thrombokinase on (Dr. J H. Milstone), 1127
Cellulose and Cellulose Ion Exchanger : Non-specific Haemagglutinin from (Prof. B. Schmidt, Dr. K. Grossgebauer and D. Hartmann), 790
Cellulose Ion Exchanger : Non-specific Haemagglutinin from Cellulose and (Prof B. Schmidt, Dr. K. Grossgebauer and D. Hartmann), 790
Celmer, W. D. (Hobbs, D. C., and) : Structure of the Antibiotics *PA*1148-I and *PA*1148-3, 598
Cement-Aggregate Bond-Strength : Dependence of, on Size of Aggregate (K. M. Alexander and J. Wardlaw), 230
Cement and Concrete Association : Grant of £2,100 to the Department of Civil Engineering in the University of Leeds, 465
Centenary and an Outlook : Experiment in Psychology—a (Prof. R. C. Oldfield), 846
Centenary Celebrations of the births of W. M. Bayliss and J. S. Haldane in Moscow (D. A. Sakharov), 912
Central Advisory Council for Education—England : Report, Vol. 2, Surveys, 883
Central Advisory Water Committee : Second Report of the Sub-Committee on Growing Demand for Water, 198
Central Australian Aborigine : Haematology of the (J. R. Casey-Smith), 903
Central Nervous System and Behavior—Transactions of the Second Conference, Princeton, 1959 (edited by Mary A. B. Brazier), *review* by Dr. Henry Miller, 6
Centre d'Études Nucléaires (European Productivity Agency of the Organization for European Economic Co-operation and the) : International Information Centre for Food Irradiation, 741
Centre Inter-Universitaire de Recherches Enzymologiques : Colloquium on Intracellular Localization of Enzymes, 836
Centre National de la Recherche Scientifique : International Colloquium on the Physics of Electrostatic Forces and their Applications, 466
  Colloques Internationaux No. 79, Premier Colloque International de Photographie Corpusculaire (Strasbourg, 1957), *review* by D. L. Allan, 636
Cerebral Hemispheres : An Unidentified Pharmacologically Active Substance extracted from (P. F. L. Andrews, Shirley A. P. Price and Dr. G. B. West), 420
Cerebrospinal Fluid : 5-Hydroxytryptamine in (A. Akcasu, M. Akcasu and S. B. Tumay), 324
Cerkasov, J. (Hodek, I., and) : Prevention and Artificial Induction of the Imaginal Diapause in *Coccinella 7-punctata* L., 345
Ceskoslovenské Republiky : Atlas Podnebí (Climatic Atlas of the Czechoslovak Republic), *review* by G. A. Bull, 543
Cestodes of Vertebrates : Classification of the, *review* by Dr. Ben Dawes, 723
Chace, William G., and Moore, Howard K. (edited by) : Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959, conducted by Geophysics Research Directorate of the Air Force Cambridge Research Center, with the co-operation of Lowell Technological Institute Research Foundation), *review* by Dr. B. A. Thrush, 726
Chadwick, Sir James : Re-appointed a part-time member of the United Kingdom Atomic Energy Authority, 743
Chain, Prof E. B., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
  Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238
Chain (Adaptive), in the Conversion of Antimetabolites into Metabolites (Dr. K. I. Markov, Dr. G. K. Saev and Dr. E. V. Golovinsky), 1041
Chain Fracture during the Cross-linking of Rubber : Analysis of Solubility Data to estimate Small Amounts of (L. Mullins and D. T. Turner), 145
Chakrabartty, S. K., and others : Initial Stages of Oxidation of Coal, 502
Chakravorty, Maharani : Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the Test Organism, 239
Chaleur des Réacteurs Nucléaires : Évacuation et Récupération de la (Richard Alami et Paul Ageron), *review* by R. J. Syme, 636
Chalk, Dr. L : The Development of Pulp and Particle Board Industries and their Effect on Forest Management (Problem of 'Juvenile' Wood), 33
Chambers (British) of Commerce, Association of (British Association for the Advancement of Science and the) : Decimal Coinage and the Metric System—Should Britain Change ? (A joint Report of Committees appointed by the), 30
Chance Brothers, Ltd., Smethwick : Retirement of Dr. W. M. Hampton as managing director, 905
Chandos, Viscount : Electricity—the New Horizon (Presidential Address to the British Electrical Power Convention), 557
  Messel Medal Address to the Society of Chemical Industry, 831
Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Change (Local Cytotoxic), in Man from Griseofulvin : Absence of (Prof. Leon Goldman, Amanda Beyer and Jan Schwarz), 335
Change (Social), in Tikopia (Prof. Raymond Firth), *review* by Sir Harry Luke, 816
Changes in Conductivity of Pure Water caused by X-Irradiation (K. Schmidt), 931
Changes produced by Cooling and by Drugs known to affect Adrenergic Mechanisms : Parallelism of (Prof. Eleanor Zaimis), 213
Changes (Colour), of Ageing Bloodstains : Use of Reflectance Measurements in assessing the (Dr. D. Patterson), 688
Changes (Cyclical), in the Distribution of the Testis Lipids in the Common Frog, *Rana temporaria* (Dr. B. Lofts and C Boswell), 708
Changes (Oxygen Consumption), in Rats during Irradiation : Role of Initial Value of Metabolic Processes in (Dr. A. Vacek), 76
Changes (*p*H), during Muscle Twitch and Tetanus (A. Distèche), 1119
Changing World Population : Planning for the, *review* by M. K. Milne, 816
Chanteur, Jean, and Pellerin, Pierre : Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in Consecutive Internal Irradiation, 472
Chaos chaos (Giant Amoeba) : Streaming in Cytoplasm dissociated from the (Prof. R. D Allen, J W. Cooledge and P. J. Hall), 896
Chapman, R. E., and others : Abnormal Crimping in Merino and Polwarth Wools, 960
Chapman, Prof. Sydney : I.G.Y., Year of Discovery—the Story of the International Geophysical Year, *review* by Prof. S. K. Runcorn, 185
  Geomagnetic Storms and the Space around the Earth, 824
Chapman, Prof. V. J. : University Education in New Zealand, 107
Chara vulgaris L. subjected to X-Rays : Delayed 'Primary' Effects in (C. M. Gillet), 874
Character of the Ligands in Dibenzene Chromium (Dr. F. Jellinek), 871
Character (Meristic), in Coleoptera : Ovarioles as a (Dr. J. G. Robertson), 526
Character (Oscillatory), of Amplitude Curves for Seismic Body Waves (Dr. J. Vanek and J. Stelzner), 491
Characteristics (Sedimentation), of the γ-Chain Haemoglobin (Haemoglobin 'Bart's'), (Dr R. A. Kekwick and Dr. H. Lehmann), 158
Characterization of Pseudocoelomic Membranes of *Ascaris lumbricoides* : Use of Collagenase in the (Barbara Dawson), 798
Characters (New Deficient), in Streptomycin-resistant Mutants of *Bacillus subtilis* : Appearance of (Masamichi Kohiyama and Yonosuke Ikeda), 168
Chargaff, Prof. Erwin, and others : A Bleached Variant of *Euglena gracilis* showing a Doubling of the Content of Deoxyribonucleic Acid, 1037
Charge : Effect of Surface Density of, on the Physical Swelling of Lithium Montmorillonite (Dr. J. P. Quirk and B. K. G. Theng), 967
  Photo-injection of, into Dielectric Liquids (M. J. Morant), 48
Charged Particles in Matter : Penetration of—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (edited by A. Vehling), (United States National Academy of Sciences—National Research Council, Nuclear Science Series, Report No. 29), 1086
Charig, Dr. A. J. : *Obituary* of Dr. G. H. Francis, 284
Charlton, T. M. · A Historical Note on the Reciprocal Theorem and Theory of Statically Indeterminate Frameworks, 231
Chatt, Dr. J., and others : Some New Hydrides of Iron and Osmium, 55
Chatterjee, B N. : Food and Animal Production Overseas (Animal Production and Fodder Resources in India), 1071
Chatterton, N., and others : Ionospheric Modification of the Radio Emission from Jupiter, 568
Chelates (Cupric β-Diketone), with Heterocyclic Bases : Structure of the 1,1-Adducts of (Dr. D. P. Graddon and E. C. Watton), 1021
Chelates (Ethylenediamine Tetraacetic Acid) · Differential Thermal Analysis of some Transition Metal (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Chelating Agents : Removal of Internally Deposited Americium by (Dr. F D. Sowby and Dr. D. M. Taylor), 612
Chelating Agents (Injected) : Sustained Action of (Dr. A. Lindenbaum and Dr J. Schubert), 575
Chemical Analytical Methods : A Handbook of Colorimetric (Tintometer, Ltd.), fifth edition, *review* by A. M. G. Macdonald, 3
Chemical Behavior of Zirconium (Warren B. Blumenthal), *review* by Prof. A. G. Quarrell, 725
Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks : Comparison of the (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Chemical Constitution of the Red Blood Cell Membrane (Dr. T. Fehér and Dr. Béla Matkovics), 701
Chemical Control of Agricultural Pests and Conservation of America's Wild-Life (United States National Academy of Sciences—National Research Council Committee on), 114
Chemical Effects of Ionizing Radiations on Nucleic Acids and Nucleoproteins (P. Emmerson, Dr. G. Scholes, D. H. Thomson, J. F. Ward and Prof. J. Weiss), 319

Chemical Elements (Rare and Dispersed), in the Soil : The Geochemistry of (A. P. Vinogradov), second edition, (translated from the Russian), *review* by A. H. Debnam, 629
Chemical Engineering Practice (edited by Herbert W. Cremer and Sidney B. Watkins), Vol. 11, Works Design, etc., *review* by Prof. J. M. Coulson, 887
Chemical Engineers, Institution of (Constructors John Brown, Ltd., and the) : A CJB Scholarship awarded to M. D. Taylor, 650
Chemical Federation (Royal Netherlands), and others : International Congress on the Technology of Plastics Processing, 559
Chemical Industry in Basle The Story of (published by Ciba Limited on the occasion of its 75th Anniversary), *review* by Dr. L. K. Sharp, 540
Chemical Industry, Society of : Appointment of Dr. T. F. West as editor of *Chemistry and Industry*, 290
  Fourth Robert Horne Memorial Lecture (Prof. F. D. Richardson), 466
  Presidential Address, Research and Development in Industry (Dr. E. J. Solvay), 830
  Messel Medal Address (Viscount Chandos), 831
  Castner Memorial Lecture (Dr. W. J. Kroll), 994
Chemical Industry, Society of (Plastics and Polymer Group) : Symposium on High-Temperature Resistance and Thermal Degradation of Polymers, 466
Chemical Industry, Society of (Corrosion Group of the Birmingham and Midlands Section), Institution of Gas Engineers and the : Symposium on the Protection of Gas Plant and Equipment from Corrosion, 466
Chemical Industry, Society of (Manchester Section and Fine Chemicals Group), (Manchester and District Section of the Royal Institute of Chemistry and the) : Symposium on Drugs for the Treatment of Hypertension, 743
Chemical Institute of Canada (National Research Council of Canada and the) : Tenth High Polymer Forum, 117
Chemical Laboratories (New), in the University of Sydney (Prof. R. J. W. Le Fevre), 833
Chemical Laboratory (National), Teddington : Report for 1959, 902
  Open Days, 994
Chemical Manufacturers (British), Association of : Booklet on Chemical Plant Instrumentation—some Notes on the Use of Measuring Instruments, 1079
Chemical Physics : Advances in (edited by Prof. I. Prigogine), Vols. 1 and 2, *review* by Prof C A Coulson, 812
Chemical Physics Comes of Age, *review* by Prof. C. A. Coulson, 812
Chemical Plant : The Design and Construction of High Pressure (Harold Tongue), second edition, *review* by Dr. K. E. Bett, 541
Chemical Plant Instrumentation—some Notes on the Use of Measuring Instruments (Association of British Chemical Manufacturers), 1079
Chemical Reactions : Initiation of, by Mechanical Forces (Dr. Robert Schnurmann and Ivor S. Stringer), 587
Chemical Reactivity with Mercaptalbumin : An Ortho Effect Influencing Fungitoxicity, Electronic Absorption Spectra, and (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Chemical Society Grants for assistance in Research in any branch of Chemistry, 466
  Special Publication No. 14, Handbook for Chemical Society Authors, 832
Chemical Society (American) : Monograph Series No. 139, The Science of High Explosives (Prof Melvin A. Cook), *review* by Dr. W. L. Murray, 539
  Monograph Series No. 134, The Chemistry and Technology of Leather (edited by Fred O'Flaherty, William T. Roddy and Robert M. Lollar), Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
Chemical Society Authors Handbook for (Chemical Society, Special Publication No. 14), 832
Chemical Technology at Edinburgh, 555
Chemical and Molecular Basis of Nerve Activity (David Nachmansohn), *review* by Dr. D. H. Brinton, 447
Chemical and Physical Properties of the Small Deoxyribonucleic Acid Component of Crystalline Cytochrome B_2 (Dr. M. D. Montague and Prof. R. K. Morton), 916
Chemicals (Toxic), in Agriculture and Food Storage : Use of (Request from the Research Study Group for evidence), 290
Chemicus : *Index* (Institute for Scientific Information, Philadelphia), No. 1, 993
Chemist (Government) : Report for 1958-59, 1076
Chemistry is Not Enough (Dr. James Taylor), 841
Chemistry : Fellowships in (Ramsay Memorial Fellowship Trust Awards for 1960-61), 832
  Grants for assistance in Research in any branch of (Chemical Society), 466
  New Horizons in (Sir Alexander Todd), 819
  Nuclear Reactor (Oak Ridge National Laboratory Conference on), 994
  Pure and Applied (International Union of Pure and Applied Chemistry Seventeenth International Congress of), 29, *erratum*, 117
  Quantum—Methods and Applications (R. Daudel, R. Lefebvre and C Moser), *review* by Prof. H. C. Longuet-Higgins, 541
Chemistry, Royal Institute of (Manchester and District Section), and the Society of Chemical Industry (Manchester Section and Fine Chemicals Group) : Symposium on Drugs for the Treatment of Hypertension, 743
Chemistry (Analytical), in Nuclear Reactor Technology (Oak Ridge National Laboratory Conference on), 994
Chemistry (Analytical), of Titanium Metals and Compounds (Maurice Codell), *review* by Prof A. G. Quarrell, 725
Chemistry (Analytical), and Applied Spectroscopy (Twelfth Pittsburgh Conference on), 289
Chemistry (Clinical) : Advances in (edited by Harry Sobotka and C. P. Stewart), Vol. 2, *review* by Dr. R. Consden, 890
Chemistry (Crystal), of Simple Compounds of Uranium, Thorium, Plutonium, Neptunium (E. S. Makarov), translated from the Russian by E B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Chemistry (Inorganic) : Annual Reviews on, *review* by Dr. L R. Beattie, 4
  Comprehensive (edited by Prof M. Cannon Sneed and Prof. Robert C. Brasted), Vol. 7, The Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), *review* by Dr. K. W. Bagnall, 185
  Progress in (edited by F. Albert Cotton), Vol. 1, *review* by Dr. L R. Beattie, 4
Chemistry (Physical), of Aerosols (Faraday Society General Discussion on), 201
Chemistry (Pure and Applied), International Union of : Seventeenth International Congress of Pure and Applied Chemistry, 29, *erratum*, 117
Chemistry (Pure and Applied), International Union of (sponsored by the) : Symposium on the Chemistry of Natural Products (organized by the Australian Academy of Science), 1080
Chemistry (Pure and Applied), International Union of, and others · International Congress on the Technology of Plastics Processing, 559
Chemistry (Steroid) · Recent Advances in (Kingston Technical College Postgraduate Course on), 905
Chemistry of the Earth : Physics and (edited by Prof L. H. Ahrens, Frank Press, Kalervo Rankama and Prof. S. K Runcorn), Vol. 3, *review* by B. E. Leake, 544
Chemistry of Heredity (Prof. Stephen Zamenhof), *review* by Dr. P. Cohn, 447
Chemistry of Metals : The Extraction of Metals and the (Prof F. D. Richardson), 466
Chemistry of Natural Products (Symposium on, sponsored by the International Union of Pure and Applied Chemistry, organized by the Australian Academy of Science), 1080
Chemistry and Industry : Appointment of Dr. T. F. West as editor, 290
Chemistry and Technology of Leather (edited by Fred O'Flaherty, William T. Roddy and Robert M. Lollar), Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
Cherry, R. D., and others : Major Element Relationships in Tektites, 680
Chick Embryo : Assay of Corticosteroids in the (Sir Macfarlane Burnet and N. L. Warner), 938
Chick Embryo Fibroblast Cells : An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected (Dr. J. Vilček), 73
Chidester, J. L., and others : Direct Infra-Red Spectral Analysis of the Cucumber Mosaic Virus Infection Process, 1049
Child, the Parent and the State (Dr. James Bryant Conant), *review* by Brian Holmes, 635
Chilver, E. M., and Kaberry, Dr. P. : Awarded jointly the Wellcome Medal for 1959 of the Royal Anthropological Institute, 114
Chimaeras (Homologous Radiation) : Polyvalent Immunological Tolerance in (Alena Lengerová), 160
Chimaeras (Radiation) : Identification of Transplanted Bone Marrow Cells in (P. Czerski, O. Rosiek and J. Sabliński), 955
Chimie Physique, Société de : Annual Meeting (Structure, Synthesis and Function of Deoxyribonucleic Acid), 1079
Chitin for Histology : Softening (Dr D. B. Carlisle), 1132
Chimpanzees : β-Globulin Polymorphism in (Prof. Samuel H. Boyer and Dr. William J. Young), 1035
Chittleborough, Dr. R. G. : Marked Humpback Whale of Known Age, 164
Chloramphenicol . Recovery in the Presence of, of *Escherichia coli* B(H) Irradiated with Ultra-violet Light (Kenshi Suzuki and Yukiko Iwama), 347
Chloride (Sodium) : Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Chloride (Tetrakis (Hydroxymethyl) Phosphonium) : Action of, on Wool (L. S. Bajpai, Prof. C. S. Whewell and J. M. Woodhouse), 602
Chloride Gases (*n*-Alkyl) : Ionization and Attachment Coefficients in (J. C. Devins and O H. LeBlanc, jun.), 409
Chlorine—Sodium Ratio in the Atmosphere : Change of the, with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Choice Reaction Time : Time Uncertainty and (Paul Bertelson and Jean-Paul Boons), 531
Chopra, H. C. : Cytochemical Evidence of the Origin of Lipid Bodies (so-called Golgi Bodies) from Mitochondria, 713
Chordotonal Organs in Crustacea (Dr. Mary Whitear), 522
'Chorus' at the South Pole : Observations of 'Whistlers' and (Dr. L. H. Martin), 1018
Christian, Dr. Charles L. (Robinson, Dr. John L., and) : 6-Mercaptopurine in Immunological Responsiveness, 796
Christian, C. S., and others (edited by) : Biogeography and Ecology in Australia, *review* by Prof. A. J. Marshall, 543
Christian Belief : The Conflict between Evolutionary Theory and (Dr. David Lack), 98
Christianity : Bridging the Gap between Science and, *review* by R. Brightman, 818
Christmas 1959 : Road Accidents during (Road Research Laboratory, Technical Paper No. 49), 1000
Christodoulou, Dr. Demetrious . The Evolution of the Rural Land Use Pattern in Cyprus, *review* by Prof. M. J. Wise, 628
Christophers, Sir S. Rickard : *Aedes aegypti* (L), the Yellow Fever Mosquito —its Life History, Bionomics and Structure, *review* by Prof. V. B. Wigglesworth, 813
Chromatograms of Human Plasma : Staining for Iodine in—an Artefact due to Thioureas or Thiouracils (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691 ; *erratum*, 1079
Chromatographic Separation (Gas-Solid), of Hydrocarbons of High Molecular Weight (C. G. Scott and D. A. Rowell), 143
Chromatography (Belgisch Genootschap voor Pharmaceutische Wetenschappen International Symposium on), 374
Chromatography : 'Eddy' Diffusion in (A. Klinkenberg and F. Sjenitzer), 1023 ; (J. Calvin Giddings), 1023
Chromatography of Blood Thrombokinase on 'DEAE'-Cellulose (Dr. J. H. Milstone), 1127
Chromatography (Gas) : Determination of Fatty Acids of Lower Molecular Weight by (Marie L. Vorbeck, Leonard R. Mattick, Frank A. Lee and Carl S. Pederson), 689
  Microanalytical Separation of Steroids by (C. C. Sweeley and Dr. E. C. Horning), 144
Chromatography (Gas) Research Center : A New (Barber-Colman Company, Houston), 289
Chromatography (Gas Liquid), of Conjugated Fatty Acids (Dr. N. W. R. Daniels and J. Wendy Richmond), 55
Chromatography' ('*pH*-), of some Amphoteric Antibiotics (Vladimir Betina and Prof. Pavel Nemec), 1111

Chromatography Analysis (Gas-Liquid), of C_5–C_6 Hydrocarbons : Two Highly Selective Solvents for (Dr. A. van der Wiel), 142
Chromium (Dibenzene) : Character of the Ligands in (Dr. F. Jellinek), 871
Chromium Electro-deposit . Hexagonal Modification of Black (Hideya Okada and Takeo Ishida), 496
Chromium (17 per cent), 8 per cent Nickel and 1 per cent Niobium Steel : A New Phase in a Silicon bearing (M. J. O'Hara, D. Wilkinson and R. T. Allsop), 407
Chromobacterium prodigiosum (Serratia marcescens) : Association of Pigment with Cell Envelope of (Mira Purkayastha and Prof. R. P. Williams), 349
Chromosome Numbers in *Amaranthus* (Prof. W F. Grant), 28
Chromosome Ploidy and Radiosensitivity of Tumours (László Revész and Ulla Norman), 861
Chromosomes and the Theory of Heredity (Prof. C. D. Darlington), 892
Chromospheric Flares : Measurement of Magnetic Fields in (M. Blaha, M. Kopecky and Z. Svestka), 224
Chronic Prostato-vesiculitis : Urinary Excretion of Œstrogens in Cases of (Prof Gunnar Nylander), 154
Churchill College, Cambridge : Election of C. St. J. Wilson to a Fellowship, 742
  Election of R. A. Y. Jones, A. O. Gilchrist, C. B. Cottrell and A. Howie to Junior Research Fellowships, 742
  Election of Prof. E. E. Saltpeter and Dr. J. D. Watson to Overseas Fellowships, 742
Chymotrypsin (Acetyl-) : Structures of some Acetyl-serine Peptides from (Leo Benoiton, Prof. H. N. Rydon, R. A. Oosterbaan, M. E. Van Adrichem and Prof. J A Cohen), 596
Ciba, Limited : The Story of Chemical Industry in Basle (published on the occasion of its 75th Anniversary), *review* by Dr. L. K. Sharp, 540
Cichlid (Non-) Fishes in Lake Victoria : Breeding Sites of (Dr. Philip S. Corbet), 616
Ciliate (Histophagous) : Increase of Esterase Activity during Intracellular Digestion in a (Dr. Miklós Muller, József Tóth and Prof. Imre Toro), 65
Circuit Theory : General (Prof. Gordon Newstead), *review* by Prof. A. H. M. Arnold, 811
  General and Linear, *review* by Prof. A. H. M. Arnold, 811
Circulation (Extracorporeal) · Influence of 5-Hydroxytryptamine on Renal Function in (Dr. M. H. Frick), 609
Citation : Bibliographical (C. C. Barnard), second edition, 27
Citric Acid in the Oviduct of the Hen : Parallel Distribution of Calcium and (Dr. T G Taylor and F. Hertelendy), 244
Citrine, Lord : Re-appointed a part-time member of the United Kingdom Atomic Energy Authority, 743
Civil Service : Overseas (House of Commons Adjournment Debate on the), 371
Civil Service (Overseas) : Supplementary Pay and Allowances, 556
Civilisation : Africa's Place in the Emergence of (Prof. Raymond A. Dart), *review* by M C. Burkitt, 891
Clarenburg, Dr L. A., and Tang, C. E. Spanne-v d. : Small-Scale Turbulent Diffusion in the Atmosphere, 586
Claridge, Dr. C. A., and others : Bacterial Penicillin Amidase, 237
Claringbull, Dr G. F., and Moss, A A : The Enkomi Silver Cup, 1051
Clark, Colin : The Conditions of Economic Progress, 537
Clark, F : Influence of Editors, 121
Clark, Dr. V. M., and others : Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates, 59
Clark, Sir Wilfrid Le Gros : Elected president for 1961 of the British Association for the Advancement of Science, 852 ; work of, 852
  The Jaws and Teeth of Primates, *review*, 891
Clarke, S. At the second Annual Conference of the British Computer Society (Russian Interest in British Computing Equipment), 656
Clarke, S. A. : Retirement as chief of the Division of Forest Products of the Australian Commonwealth Scientific and Industrial Research Organization, 901 ; work of, 901
Clarke, W. J., and others : The American Oligocene, 679
Clason, W. E. : Swedish Supplement to Elsevier's Dictionary of Electronics and Waveguides, *review* by Dr. R L Smith-Rose, 1059
Classification : Coral Structures and, *review* by Dr. H. Dighton Thomas, 95
Classification of the Cestodes of Vertebrates, *review* by Dr. Ben Dawes, 723
Classification of Pharmaceutical Preparations—a Survey of Existing Legislation (World Health Organization of United Nations), 287
Claude, Georges . *Obituary* by Prof. J. Cathala, 829
Clause, A. : Intracellular Localization of Enzymes, 836
Claviceps paspali Stevens and Hall in Submerged Culture : Production of Lysergic Acid Derivatives by a Strain of (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Clay Minerals, Montmorillonite and Vermiculite : Aluminium Interlayers in—Laboratory Synthesis (B. L. Sawhney), 261
Clays : Domain or Turbostratic Structure of (L. A. G. Aylmore and Dr. J. P. Quirk), 1046
Clean Air, National Society for : Year Book for 1960, 200
Clearing Action (Lipaemic), of Artificial Anticoagulants (Dr. E. P. George, Dr. C. V. Hall and Dr. G. S. Farkas), 782
Cleavage : Thermal Conduction in Mica along the Planes of (H. J. Goldsmid and A. E. Bowley), 864
Cleavage of Human γ-Globulin (Dr. Rosa Augustin and Barbara J. Hayward), 129
Cleaveland, Dr. Frederic N. : Science and State Government—a Study of the Scientific Activities of State Government Agencies in Six States, *review* by R. Brightman, 181
Cleghorn, Dr. T. E. · MNSs Gene Frequencies in English Blood Donors, 701
  A 'New' Human Blood Group Antigen, Sw^a, *erratum*, 743
Clement, J. R., and others : The Helium-4 Scale of Temperature, 1077
Clements, Dr. F. W. : Elected an honorary member of the American Institute of Nutrition, 374
Climates (Tropical), and Biology (Dr. G. S. Carter), 843
Climatic Atlas of the Czechoslovak Republic, *review* by G. A. Bull, 543
Clinical Chemistry : Advances in (edited by Harry Sobotka and C. P. Stewart), Vol. 2, *review* by Dr. R. Consden, 890
Clinical and Genetico-Statistical Study of Schizophrenia and Low-Grade Mental Deficiency in a Large Swedish Rural Population (Bertil Hallgren and Torsten Sjogren), 298
Clitoria marina Linn. : Isolation of a δ-Lactone Compound from the Leaves of (Dr. A. Sinha), 149
Clone Culture : Morphogenetics of *Micrasterias americana* in (Prof. Paavo Kallio), 164
Closed Conduits : Flow Measurement in (National Engineering Laboratory Symposium on), 905
Cloud Pictures from Satellite *Tiros* I, 647
Clover (White) : Biosynthesis of Linamarin and Lotaustralin in (G. W. Butler and Bera G Butler), 780
Coal : Initial Stages of Oxidation of (S. K. Chakrabartty, B. K. Mazumdar and A. Lahiri), 502
Coal (High-volatile Bituminous) : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Coal, Electricity and Gas Industries Capital Investment in the (Ministry of Power), 1055
Coast (California), 1959-60 : Fall-out Caesium in Surface Sea Water off the, by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Cobalt in Nitrogen Fixation : Copper and (Prof. E. G. Hallsworth, S. B. Wilson and E. A. N. Greenwood), 79
Cobalt (Nickel and) : Determination of, by Atomic Absorption (J. E. Allan), 1110
Cocaine : Effect of, on the Disposition of Noradrenaline labelled with Tritium (Dr. L. G. Whitby, G. Hertting and Dr. J. Axelrod), 604
Coccinella 7-punctata L. : Prevention and Artificial Induction of the Imaginal Diapause in (I. Hodek and J. Cerkasov), 345
Cochran, Prof G. W., and others : Direct Infra-Red Spectral Analysis of the Cucumber Mosaic Virus Infection Process, 1049
Cockayne, B. : Appointed to a Research Fellowship in physical metallurgy in the University of Birmingham, 117, 465
Cockburn, Christine : In Pursuit of World Health, *review*, 722
Cockcroft, Dr. W. H. : Title of reader in mathematics in the University of Southampton conferred on, 290
Cocking, Dr. E. C. : A Method for the Isolation of Plant Protoplasts and Vacuoles, 962
Cockrell, D J. : Appointed lecturer in engineering at the University of Leicester, 743
Cocoa : Transmission of a Gall Disease of (A. L. Wharton and A. A. Brunt), 80
Cocoa (Self-incompatible) : Selfing of (D. R. Glendenning), 170
Codell, Maurice : Analytical Chemistry of Titanium Metals and Compounds, *review* by Prof. A. G. Quarrell, 725
Coed Rheidol Nature Reserve : Addition to the (Nature Conservancy), 464
Coefficient (The Second Virial), of Methane at Low Temperature (G. Thomaes and R. Van Steenwinkel), 229
Coefficients (Attachment) : Ionization and, in *n*-Alkyl Chloride Gases (J. C Devins and O H. LeBlanc, jun), 409
Coefficients (Diffusion), in Liquid Systems by the Diaphragm-Cell Technique : Equations for determining (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Coefficients (Flow), of Permeable Solids · Measurement of Slip (*Ko*) and Viscous (*Bo*), (J. G. Biram), 865
Coenzyme I : Non-Enzymic Reactions of Indoles with (Prof. S. G. A. Alivisatos, G. A. Mourkides and A. Jibril), 374
Coenzyme Content of Hepatomas induced by Butter Yellow : Vitamin and (M. H. Briggs), 249
Coetzee, Prof. J. N., and others : Host-Range of *Lactobacillus* Bacteriophages, 348
Cohen, Prof. J. A., and others : Structures of some Acetyl-serine Peptides from Acetyl-chymotrypsin, 596
Cohen, P. S : Appointed lecturer in sociology at the University of Leicester, 743
Cohn, Dr P. : Biochemistry and Heredity, *review*, 447
  Cytoplasmic Particles and their Role in Protein Synthesis, 643
Cohn, Dr. P., and Butler, Prof. J. A. V. : Cytoplasmic Particles and their Role in Protein Synthesis (Composition of Ribonucleoprotein Fractions from the Microsomes of Rat Liver), 645
Coinage (Decimal), and the Metric System—Should Britain Change ? (A Joint Report of Committees appointed by the British Association for the Advancement of Science and the Association of British Chambers of Commerce), 30
Colchicine-induced Tetraploids of *Annona squamosa* L. : Unproductivity in the (Prof. Ahmad Shamsul Islam), 343
Cold and at Room Temperature : Biosynthesis of Sucrose by Preparations from Potatoes stored in the (Dr. Sigmund Schwimmer and Edward S. Rorem), 1113
Cold-Cathode Arcs Stepwise Ablation and Heat Transfer in (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Cold Spring Harbor Symposia on Quantitative Biology · Vol. 24, Genetics and Twentieth Century Darwinism, *review* by Dr H. Kalmus, 726
Cole, Dr. L. J. (Rosen, jun., Lieut. V J , and) : Radiosensitivity of Mouse Kidney undergoing Compensatory Hypertrophy, 612
Cole, Dr. M., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Cole, Sonia : Biography of *Australopithecus*, *review*, 888
Coleman, G. S. : Effect of Penicillin on the Maintenance of Rumen Oligotrich Protozoa, 518
Coleoptera : Ovarioles as a Meristic Character in (Dr. J. G. Robertson), 526
Coleoptile (*Avena*) : Plastids of the (Helen P. Sorokin and Prof. Kenneth V. Thimann), 1038
Coleoptiles : Electrostatic Measurement of the Geoelectric Effect in (Carl Hellmuth Hertz), 320
Coles, Dr. B. R., and Griffiths, D. : Ferromagnetic and Antiferromagnetic Behaviour in the Second Transition Group, 226
Colicinogeny : Genetic Recombination in *Salmonella typhimurium* occurring during Transmission of (Dr. Ozeki and Dr Howarth), 649
Colin, R., and others . Mass Spectrometric Investigation of the Vaporization of Sulphides and the Dissociation Energy of S_2, 408
Collagen : Hydroxyproline and the Shrinkage Temperature of (B. J Rigby and Dr. J. D. Spikes), 150
Collagenase : Use of, in the Characterization of Pseudocoelomic Membranes of *Ascaris lumbricoides* (Barbara Dawson), 798
Colleges (Training) Recruits to Teaching—a Study of the Attainments, Qualifications and Attitudes of Students entering (F. W. Land), 750

Colles des Glutinants et Matières d'Apprêts : Traité Général de la Fabrication des (Dr. Maurice de Keghel), nouvelle édition, *review* by Prof. A. G. Ward, 890
Collier, Dr. H. O. J., and others : Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin, 773
Collins, Rear-Admiral K. St.B. : Retirement as hydrographer to the Navy, 285 ; work of, 285
Collinson, Dr. E., and others : Effects of Linear Energy Transfer on the Radiolyses of Water and Heavy Water, 475
Collis, L. R. (Rowntree, Prof. R. J., and) : Effect of the Peritoneal Fluid of the Guinea Pig on Strains of Enteric Bacilli, 1045
Collisions (Sir Harrie Massey), 853
Colloid and Polymer Science (Seminar at University College, London, on), 378
Colonial Development Corporation : Annual Report for 1959, 854, 971
Colonial Office : Fishery Publications No. 13, Plankton of the Estuary and Offshore Waters of the Sierra Leone River (V. Bainbridge), 557
Colonial Office (Commonwealth Relations Office) : Commonwealth Educational Co-operation, 441
Colonial Sugar Refining Co. : The David North Plant Research Centre (K. T. Glasziou), 745
Colonial Territories, 1959-1960 : The, 906
Colonial Territories : British, 906
Colorimetric Analysis, *review* by A. M. G. Macdonald, 3
Colorimetric Chemical Analytical Methods : A Handbook of (Tintometer, Ltd.), fifth edition, *review* by A. M. G. Macdonald, 3
Colorimetric Determination of Traces of Metals (Prof. E. B. Sandell), third edition, *review* by A. M. G. Macdonald, 3
Colour : Birds in (illustrated by Karl Aage Tinggaard, with descriptions by Bruce Campbell), *review* by B. J. G. Marland, 273
Colour Changes of Ageing Bloodstains : Use of Reflectance Measurements in assessing the (Dr. D. Patterson), 688
Colter, Dr. J. S., and others : Reversible Dissociation of Ribonucleic Acid, 509
Columbia University, New York : Barnard Medal for 1960 awarded to Prof. I. L. Rabi, 24
Colwyn Medal of the Institution of the Rubber Industry awarded to Dr. Erich Konrad, 464
Combating the Decay of Timber, *review* by Prof. F. W. Jane, 977
Combined Oil-immersion, Phase-contrast and Dark-ground Viewing of 'Thorotrast' in Tissue Sections (Dr. E. W. Baxter), 162
Combustion and Propulsion (AGARD fourth Colloquium on—High Mach Number Air-breathing Engines), 18
Commerce (British Chambers of), Association of (British Association for the Advancement of Science and the) : Decimal Coinage and the Metric System—Should Britain Change? (A Joint Report of Committees appointed by the), 30
Commons, House of : Second Reading of the International Development Association Bill, 266
  Adjournment Debate on the Overseas Civil Service, 371
  Second reading of the Commonwealth Teachers Bill, 441
  Debates on Science and Education, 906
Commonwealth : Educational Co-operation in the, 113, 441
Commonwealth (British) : Plant Pathology in the (Dr. G. C. Ainsworth), 834
Commonwealth Bureau of Horticulture and Plantation Crops : Technical Communication No. 25, Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Commonwealth Bursaries Scheme (Royal Society and Nuffield Foundation) : Awards, 291
Commonwealth Educational Co-operation, 113 ; (Commonwealth Relations Office, Colonial Office), 441
Commonwealth Mycological Conference : Sixth (Commonwealth Mycological Institute), 834
Commonwealth Mycological Institute : Sixth Commonwealth Mycological Conference, 834
Commonwealth Relations Office (Colonial Office) : Commonwealth Educational Co-operation, 441
Commonwealth Scholarship Commission (United Kingdom) : Scholarship Awards, 464
Commonwealth Scientific and Industrial Research Organization (Australian) : Establishment of a new Sugar Research Laboratory, 372
  Appointment of Dr. H. H. Hatt as leader of research in the Sugar Research Laboratory, 372
  List of Publications to December 31, 1959, 466
  Appointment of Dr. S. D. Hamann as chief of the Division of Physical Chemistry, 901
  Retirement of S. A. Clarke as chief of the Division of Forest Products, 901
  Grant of £6,000 from the Broken Hill Proprietary Company, to support tinplate research, 904
Commonwealth Teachers Bill (Second Reading in the House of Commons), 441
Communications (Inter-Library) : 'Telex' and, 558
Communications and Electronics Dictionaries, *review* by Dr. R. L. Smith-Rose, 1059
Comparative Education : Essays in, *review* by Brian Holmes, 635
Comparison of Atomic Beam Frequency Standards (R. E. Beehler, R. C. Mockler and C. S. Snider), 681
Comparison between Caesium-controlled Oscillators : The 'GBR Experiment'—a Trans-Atlantic Frequency (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Comparison between the Effects of Cysteine and of Anoxia on the Rate of Mitosis in Lens Epithelium (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Comparison of Fission Product and Beryllium-7 Concentrations in the Atmosphere (W. Anderson, R. E. Bentley, R. P. Parker, J. O. Crookall and L. K. Burton), 550
Comparison of Iodine-124 and Iodine-131 in Inhibition of Goitrogenesis in the Rat (Dr. L. Doniach and Dr. P. E. Francois), 704
Comparison of Sampling Methods : Earthworm Population Studies—a (F. Raw), 257
Compensatory Hypertrophy : Radiosensitivity of Mouse Kidney undergoing (Lieut. V. J. Rosen, Jun., and Dr. L. J. Cole), 612
Complex (An Antibiotic), derived from a *Streptomyces* and Active against Gram-positive Bacteria (B. Sgarzi, A. M. Lugli and G. Giolitti), 1029
Complex (A Molecular), of Benzene and Hexafluorobenzene (Dr. C. R. Patrick and G. S. Prosser), 1021
Component (Deoxyribonucleic Acid), of Crystalline Cytochrome b_2 : Chemical and Physical Properties of the Small (Dr. M. D. Montague and Prof. R. K. Morton), 916
Component (Melanocyte-stimulating), in the Dorsal Skin Secretion of *Xenopus laevis* : Serotonin, a (Dr. F. C. G. van de Veerdonk), 948
Components (Precipitating), in Sera from Pregnant Women : Immunoelectrophoretic Demonstration of (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
Composition (Average), of Granites, the Genesis of Tektites, and Petrogenesis (Prof. E. H. Timothy Whitten), 867
Composition (Chemical), and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks : Comparison of the (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Composition (Fatty Acid), of the Lipids of Pasture Grasses (Dr. G. A. Garton), 511
Composition (Isotopic), and Temperature of Formation of Antarctic Snows (Prof. E. Picciotto, X. de Maere and Dr. I. Friedman), 857
Compositions (Soluble Matrix Antifouling) : Mode of Action of (A. Partington), 1105
Compound (δ-Lactone) : Isolation of a, from the Leaves of *Clitoria marina* Linn. (Dr. A. Sinha), 149
Compounds : Utilization of Nitrogen and its, by Plants—Symposia of the Society for Experimental Biology, No. 13 (edited by H. K. Porter), *review* by Prof. Walter Stiles, 815
Compounds of Group IVA : The Elements and (Harold P. Klug and Prof. Robert C. Brasted), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed and Prof. Robert C. Brasted, Vol. 7), *review* by Dr. K. W. Bagnall, 185
Compounds related to Diethylstilboestrol : Effect of Three, on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
Compounds (Aromatic Hydroxy) : Effect of some, on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, C. Druce and C. C. Ware), 422
Compounds (Carbon-Fluorine), in some Species of *Dichapetalum* : Fluorine Compounds in Nature—the Distribution of (Sir Rudolph Peters and R. J. Hall), 573
Compounds (Fluorine), in Nature—the Distribution of Carbon-Fluorine Compounds in some Species of *Dichapetalum* (Sir Rudolph Peters and R. J. Hall), 573
Compounds (New), for the Control of Water Evaporation (A. V. Deo, N. R. Sanjana, S. B. Kulkarni, M. K. Gharpurey and A. B. Biswas), 870
Compounds (Simple), of Uranium, Thorium, Plutonium, Neptunium : Crystal Chemistry of (E. S. Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Compounds (Strontium-90), in Soil : Relative Availability of some (Dr. R. L. Uhler and Dr. P. P. Hungate), 252
Compounds (Surface-active) : Action of some, on the Gastro-Intestinal Mucosa (Dr. J. A. Nissim), 305
Compounds (Titanium Metals and) : Analytical Chemistry of (Maurice Codell), *review* by Prof. A. G. Quarrell, 725
Comprehensive Inorganic Chemistry (edited by Prof. M. Cannon Sneed and Prof. Robert C. Brasted), Vol. 7, The Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), *review* by Dr. K. W. Bagnall, 185
Computer : A New British Analogue, the *Radic* (The Rediffon Company), 288
  Leo III, a New All-Transistor Digital (Leo Computers, Ltd.), 373
Computer (BESM) : Programming Programme for the (A. P. Ershov), translated from the Russian by M. Nadler, edited by J. P. Cleave, *review* by R. J. Ord Smith, 92
Computer Society (British) : Second Annual Conference (Dr. L. Fox), 655
Computer Techniques : Application of, to Nuclear Physics Instruments (G. G. Scarrott), 854
Computers (Electronic) : Research in the Use of (Unesco Fellowships for), 465
Conant, Dr. James Bryant : The Child, the Parent and the State, *review* by Brian Holmes, 635
Concentrated Urea–Lithium Bromide Solutions : Viscosity of (Dr. Irving I. Geschwind), 324
Concentration (Acetylcholine), in the Brain of the Rat : Strain Differences in (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Concentration (Serum Albumin), in Analbuminaemia and its Immunological Significance (Dr. J. H. Humphrey), 304
Concentrations of Solutions : Expression of (E. H. Leach), 350
Concentrations (Fission Product and Beryllium-7), in the Atmosphere : Comparison of (W. Anderson, R. E. Bentley, R. P. Parker, J. O. Crookall and L. K. Burton), 550
Concept of the Electric and Magnetic Field : Michael Faraday and the Evolution of the (Prof. L. Pearce Williams), 730
Concept (The Dangerous), of the Natural Forest (T. R. Peace), 848
Conditioning *Ostrea edulis* L. from the Limfjord for Reproduction out of Season (I. A. Aboul-Ela), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 25), *review* by Dr. A. J. Southward, 360
Conditions of Economic Progress (Colin Clark), 537
Conductance (Decreased Membrane) : Excitation at the Crayfish Neuromuscular Junction with (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
Conduction : Velocity of, and Spinal Transmission of Proprioceptive Hind-Limb Reflexes (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 132
Conduction (Thermal), in Mica along the Planes of Cleavage (H. J. Goldsmid and A. E. Bowley), 864
Conductivity of Pure Water : Changes in, caused by X-Irradiation (K. Schmidt), 931

Conduits (Closed): Flow Measurement in (National Engineering Laboratory Symposium on), 905
Configuration (Intracellular), and Dedifferentiation in *Splachnum ampullaceum* (L.) Hedw. (Prof. Kraft E. von Maltzahn and Mary M. MacNutt), 344
Confinement Geometry: A New Plasma (James L. Tuck), 863
Conflict between Evolutionary Theory and Christian Belief (Dr. David Lack), 98
Confluent Hypergeometric Functions (Dr. L. J. Slater), *review* by Prof. W. N. Bailey, 93
Conjugated Fatty Acids. Gas Liquid Chromatography of (Dr. N. W. R. Daniels and J. Wendy Richmond), 55
Connan, R. M.: Awarded a R.A.S.E. Research Training Scholarship by the Animal Health Trust, 904
Connective Tissue, Thrombosis and Atherosclerosis—Proceedings of a Conference held at Princeton, N.J., 1958 (edited by Irvine H. Page), *review* by Dr. G. S. Boyd, 634
Connors, J. F., and Oberry, L. J.: Combustion and Propulsion—High Mach Number Air-breathing Engines (Basic Studies on Air Intakes), 20
Conquest of Disease: Achievement—some Contributions of Animal Experiment to the (Dr. Geoffrey Lapage), *review* by Dr. W. Lane-Petter, 977
Conran, G. L.: At the sixty-sixth Annual Conference of the Museums Association (Purchase of Art Objects for Museums), 657
Consden, Dr. R.: Advances in Clinical Chemistry, *review*, 890
Consecutive Internal Irradiation: Localization by Autoradiography at −195°C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in (Jean Chanteur and Pierre Pellerin), 472
Conservation of America's Wild-Life: Chemical Control of Agricultural Pests and (United States National Academy of Sciences—National Research Council Committee on), 114
Conservation in East Anglia: Nature and (Council for Nature), 649
Constants and Numerical Data: Tables of, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids (Prof. J.-P. Mathieu and Prof. M.-M. Janot), *review* by Dr. J. Walker, 7
Constitution (Chemical), of the Red Blood Cell Membrane (Dr. T. Fehér and Dr. Béla Matkovics), 701
Construction of High Pressure Chemical Plant: The Design and (Harold Tongue), second edition, *review* by Dr. K. E. Bett, 541
Consumption (Oxygen), and Carbon Dioxide Output: Effect of Electronarcosis on (Dr. Jaroslav Strmiska and Dr. Antonin Vacek), 151
Consumption Changes (Oxygen), in Rats during Irradiation: Role of Initial Value of Metabolic Processes in (Dr. Antonin Vacek), 76
Contamination (Surface), formed in Demountable Vacuum Systems: Direct Observation of (D. E. Bradley), 227
Continental Slope: Occurrence of *Pyrosoma* on the (P. J. Whitehead), 878
Continuity in a Small Pacific Island, *review* by Sir Harry Luke, 816
Continuous Variation: Genetics of, *review* by Prof. Kenneth Mather, 813
Contour (Single): Perceptual Anomalies associated with a (J. P. Wilson), 137
Contractility in the Heart Muscle of the Rat and some other Mammals: Potentiation of (Dr. V. Kruta and Dr. P. Braveny), 327
Contraction in Striated Muscle: A Hypothesis of (Dr. M. Spencer and Dr. C. R. Worthington), 388
Contreras, José Garcia: Awarded a Spanish fellowship by the Ramsay Memorial Fellowship Trustees, 832
Control: Noise in Factories and its (S. Weintroub), 1085
Control of Flight: Stability and, *review*, 444
Control of *Glossina palpalis* (R-D) in Nigeria: Use of Dieldrin in the (J. B. Davies), 84
Control of Growth and Form—a Study of the Epidermal Cell in an Insect (Prof. V. B. Wigglesworth), *review* by Prof. R. Dennell, 631
Control of Pre-Natal Growth in Mammals (Dr. Anne McLaren and Dr. Donald Michie), 363
Control of Rats in Sewers (Dr. W. E. Bentley), 288
Control of Reaction Rate in Dust Flames (J. M. Beér and Dr. R. H. Essenhigh), 1106
Control of Scientific Research in the United States, *review* by R. Brightman, 181
Control of Water Evaporation: New Compounds for the (A. V. Deo, N. R. Sanjana, S. B. Kulkarni, M. K. Gharpurey and A. B. Biswas), 870
Control (Chemical), of Agricultural Pests and Conservation of America's Wild-Life (United States National Academy of Sciences—National Research Council Committee on), 114
Control (Game): Translocation of Wild Animals as a Means of (Dr. A. M. Harthoorn, J. A. Lock and J. MacKeand), 518
Control (Radio Frequency), in Space Telecommunications (Edward Wenk, Jun.), 373
Control (Successful Biological), of Insect Pests: Significance of the Type of Host Plant Crop in (D. C. Lloyd), 430
Convergence—and Divergence: The Antarctic (Dr. K. Wyrtki), 581
Conversion of Antimetabolites into Metabolites: Adaptive Chain in the (Dr. K. I. Markov, Dr. G. K. Saev and Dr. E. V. Golovinsky), 1041
Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy (C. F. Blakely, Dr. R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662; Kinetics and Mechanism (C. F. Blakely and Dr. A. Wassermann), 662
Conway, Prof. E. J.: Critical Energy Barriers in the Excretion of Sodium, 394
Cook, B. P., and others: Dependence on Temperature of the Interlayer Spacing in Carbons of Different Graphitic Perfection, 1015
Cook, Prof. C. Sharp, and others: Fractionation of Nuclear Weapon Debris, 1100
Cook, Dr. J. W.: Molecular Geometry, *review*, 812
Cook, L. M., and Kettlewell, Dr. H. B. D.: Radioactive Labelling of Lepidopterous Larvae—a Method of Estimating Late Larval and Pupal Mortality in the Wild, 301
Cook, Prof. Melvin A.: The Science of High Explosives, *review* by Dr. W. L. Murray, 539
Cook, R.: At the second Annual Conference of the British Computer Society (Language and General-purpose Programmes for Market Research), 655
Cooke, Dr. G. W.: The Measurement of Grassland Productivity, *review* 544
Cooledge, J. W., and others: Streaming in Cytoplasm dissociated from the Giant Amoeba, *Chaos chaos*, 896
Cooling: Parallelism of Changes produced by, and by Drugs known to affect Adrenergic Mechanisms (Prof. Eleanor Zaimis), 213
Coombs (The Anti-Globulin) Test in Laboratory Practice (Dr. I. Dunsford and Jean Grant), *review* by Dr. R. Drummond, 357
Co-operation: Commonwealth Educational (Commonwealth Relations Office, Colonial Office), 441
Co-operation (Educational), in the Commonwealth, 113, 441
Co-operation and Scientific and Industrial Research, 89
Co-ordinated (Five) Titanium in $K_2Ti_2O_5$ (Dr. Sten Andersson and Dr. A. D. Wadsley), 499
Co-ordination (The International), of Time Signals and Standard Frequency Transmissions (Dr. L. Essen), 452
Copeman, C. B.: Awarded the Hancock Medal for 1960 of the Institution of the Rubber Industry, 464
Copper and Cobalt in Nitrogen Fixation (Prof. E. G. Hallsworth, S. B. Wilson and E. A. N. Greenwood), 79
Copson, Prof. E. T.: Boundary Problems in Differential Equations, *review*, 451
Coral Structures and Classification, *review* by Dr. H. Dighton Thomas, 95
Corbet, Dr. Philip S.: Recognition of Nulliparous Mosquitoes without Dissection, 525
  Breeding Sites of Non-Cichlid Fishes in Lake Victoria, 616
Corbet, Dr. Philip S., and others: Dragonflies, *review* by Dr. D. E. Kimmins, 631
Cores (Sediment), from the Eastern Atlantic Ocean: Magnetization of (M.-J. Keen), 220
Cori's Ester and Phosphorylated Glucides: First International Symposium on, 117, 290
Corke, R. L., and others: The 'GBR Experiment'—a Trans-Atlantic Frequency Comparison between Caesium-controlled Oscillators, 914
Corlett, E. N.: Appointed senior research fellow in the Department of Engineering Production in the University of Birmingham, 117
Cornea Proteins: Infra-red Examination of the Association of, with Water (Dr. S. Bakerman and C. Mitchell), 1033
Cornelius, Elsie M. (Greig, H. B. W., and): Isolation of Material with Proactivator Activity from Human Serum, 1125
Cornfield, A. H.: Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of Predicting the Nitrogen-supplying Power of Soils, 260
Cornforth, Dr. J. W.: The Chemistry of Natural Products (The Biosynthesis of Polyisoprenoids), 1080
Corpus Allatum in 'Dauer-pupa' of the Silkworm, *Bombyx mori*: Function of the (Dr. Masatoshi Kobayashi), 346
Corpusculaire (Photographie): Premier Colloque International de (Strasbourg, 1957), *review* by D. L. Allan, 636
Correlation of the Alternating Stresses required to Initiate and Propagate a Fatigue Crack in Mild Steel (N. E. Frost), 233
Correspondence of Isaac Newton (edited by Prof. H. W. Turnbull), Vol. I, 1661-1675, *review* by Prof. L. Rosenfeld, 537
Corrosion: Metallic, *review* by Dr. J. M. West, 182
  The Protection of Gas Plant and Equipment from (Institution of Gas Engineers and the Corrosion Group of the Birmingham and Midlands Section of the Society of Chemical Industry Symposium on), 466
Corrosion, European Federation of: Election of the British Association of Corrosion Engineers as a member, 25
Corrosion and Oxidation of Metals (Dr. Ulick R. Evans), *review* by Dr. J. M. West, 182
Corrosion Engineers, British Association of: Elected member of the European Federation of Corrosion, 25
Corson, J. M., and others: Homotransplant Antigens—Preparation of Active Cellular Fractions, 774
Cortex (Adrenal): Specific Inhibitors of the (Prof. J. H. U. Brown), 985
Corticosteroids in the Chick Embryo: Assay of (Sir Macfarlane Burnet and N. L. Warner), 938
Cortisone: Effect of, on Degenerating Nerve Fibres in Birds (Dr. P. Glees), 327
Cory, V.: Appointed county advisory officer for Yorkshire (West Riding) in the National Agricultural Advisory Service, 1079
Cosmic Radiation: Local Increase of Intensity of (J.-P. Legrand and A. Helary), 397
Cosmic Radiation, Latin American Council of: Meeting in Rio de Janeiro, 648
Cosmic Radiation Studies in South America, 648
Cosmic Rays: Dependence on Latitude of the Amplitude of the Diurnal Variation of (Arne Eld Sandstrom, Eric Dyring and Stig Lindgren), 1099
Cosmology: Interpretation of (Dr. W. Davidson), 583; (Prof. W. H. McCrea), 583
  A Philosophy of, *review* by Dr. C. W. Kilmister, 634
Cosmology (Unified): Towards a (Prof. Reginald O. Kapp), *review* by Dr. C. W. Kilmister, 634
Cossor Communications, Ltd.: N. Elson has joined as technical director, 832
Cost of Scientific Periodical Publications (Capt. L. R. Maxwell), 1052
Cotton, F. Albert (edited by): Progress in Inorganic Chemistry, Vol. I, *review* by Dr. L. R. Beattie, 4
Cottrell, Prof. A. H.: The Strength of Solids, 659
Cottrell, C. B.: Elected to a Junior Research Fellowship (Gulbenkian Fellowship) of Churchill College, Cambridge, 742
Coulson, Prof. C. A.: Chemical Physics Comes of Age, *review*, 812
Coulson, Prof. J. M.: Chemical Engineering Practice, *review*, 887
Council for Nature: Nature and Conservation in East Anglia, 649
Council for the Preservation of Rural England: Twenty-first National Conference for the Preservation of the Countryside, 559
Council (Universities), for Adult Education: Report on the Year 1958-1959, 906
Countries (European), in Process of Development: Shortages of Scientific Personnel in, 565
Countries (Under-developed): Support for, 971
Countries (The Under-developed), of the World, 266
Countryside: Preservation of the (Council for the Preservation of Rural England twenty-first National Conference for the), 559

Coupland, Dr. R. E., and Riley, Dr. J. F.: Mast Cells and 5-Hydroxytryptamine in Precancerous Mouse Skin, 1128
Couple (Resisting): Effect of a, on the Rotational Motion of a Rigid Body (T. Nonweiler), 311
Cours Internationaux de Lyophilisation, Association des: Second International Course on Lyophilization, 29
Course on the Non-destructive Testing of Materials (British Council), 1079
Course for Trade Union Officials on the Industrial Uses of Radioisotopes (United Kingdom Atomic Energy Authority), 905
Course (Advanced), on Direction and Supervision of Scientific and Engineering Personnel (Northampton College of Advanced Technology, London), 905
Course (International Summer), on Solid State Physics (Società Italiana di Fisica), 201
Course (Postgraduate), on Recent Advances in Steroid Chemistry (Kingston Technical College), 905
Courses (Part-Time), in Further Education (J. Heywood), 189
Covalent Super-Exchange in Solid State Physics (Prof. W. S. Fyfe and Prof. J. Verhoogen), 1108
Covalent (Ionic-) Bonding in Crystals (C. H. L. Goodman), 590
Covill, R. Wade, and others: Oceanography of Long Island Sound, 123
Cowan, Dr. S. T.: Microbial Systematics, 191
Cowper, T. R.: Occurrence of *Pyrosoma* on the Continental Slope, 878
Cox, Ian: At the sixty-sixth Annual Conference of the Museums Association (Relations of Museums and Industry), 657
Cox, Peter R.: Demography, third edition, *review* by Prof. E. Grebenik, 97
Cox, Dr. Trenchard: At the sixty-sixth Annual Conference of the Museums Association (Purchase of Art Objects for Museums), 657
Crab (Horseshoe): Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the (R. Kikuchi, K. Naito and S. Minagawa), 1118
Crab (A North American Xanthoid), New to Britain (E. Naylor), 256
Crab (Shore), *Carcinus maenas* (L.): Albinism in an American Population of the (Anthony J. Provenzano, jun.), 521
Crabb, W. W. (Smith, H. Williams, and): Bacterial Population of the Nose and Skin, 288
Crack (Fatigue), in Mild Steel: Correlation of the Alternating Stresses required to Initiate and Propagate a (N. E. Frost), 233
Craig, Dennis (Dart, Prof. Raymond A., with): Adventures with the Missing Link, *review* by Sonia Cole, 888
Crathorn, Dr. A. R., and Shooter, Dr. K. V.: Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in Mouse Ascites Cells, 614
Crayfish Neuromuscular Junction: Excitation at the, with Decreased Membrane Conductance (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
A Second Mechanism of Inhibition at the (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 247
Cresser, Dr. E. H.: Appointed lecturer in microbiology at the University of Birmingham, 117
Creatine Analogue: Production of Muscular Weakness in Rats by a (Coy D. Fitch and Prof. James S. Dinning), 421
Creep of Metals under Simple Shear: A Simple Method of Investigating the (Prof. E. N. da C. Andrade), 494
Creese, Dr. Richard: Appointed to the readership in physiology at St. Mary's Hospital Medical School, London, 743
Cremer, Herbert W., and Watkins, Sidney B. (edited by): Chemical Engineering Practice, Vol. 11, Works Design, etc., *review* by Prof. J. M. Coulson, 887
Crimping (Abnormal), in Merino and Polwarth Wools (R. E. Chapman, B. F. Short and P. G. Hyland), 960
Crisis (The Spiritual), of the Scientific Age (G. D. Yarnold), *review* by R. Brightman, 818
Critical Energy Barriers in the Excretion of Sodium (Prof. E. J. Conway), 394
Crocker, R. L., and others (edited by): Biogeography and Ecology in Australia, *review* by Prof. A. J. Marshall, 543
Crofton, Prof. J. W.: Tuberculosis in Animals (Tuberculosis in Man), 997
Crookall, J. O., and others: Radiostrontium and Radiocaesium in Milk during 1959, 108
Comparison of Fission Product and Beryllium-7 Concentrations in the Atmosphere, 550
Crop (Host Plant), in Successful Biological Control of Insect Pests: Significance of the Type of (D. C. Lloyd), 430
Crops (Glasshouse) Research Institute: Open Day (F. W. Toovey), 204
Appointment of Sir William Slater as chairman of the governing body, 1079
Crops (Plantation), Commonwealth Bureau of Horticulture and: Technical Communication No. 25, Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Cross-linking of Rubber: Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the (L. Mullins and D. T. Turner), 145
Cross-linking and Degradation of Deoxyribonucleic Acid by Ionizing Radiations: Role of Oxygen in the (Peter Alexander and J. T. Lett), 933
Crosskey, R. W., and others: Attachment of Immature Simuliidae to other Arthropods, 618
Crossland, James, and others: Strain Differences in Acetylcholine Concentration in the Brain of the Rat, 787
Crowley, Dr. N. (Baum, Dr. H., and): Starch-like Polysaccharide of *Streptococcus pyogenes*, 413
Crowther, J. G.: Francis Bacon, the First Statesman of Science, *review* by Prof. B. Farrington, 817
Cruickshank, A. J. B.: Appointed lecturer in physical chemistry at the University of Bristol, 465
Cruickshank, I. A. M., and Perrin, Dawn R.: Isolation of a Phytoalexin from *Pisum sativum* L., 799
Cruickshank, I. A. M., and others: Differentiation in *Peronospora tabacina* Adam., 710
Crustacea: Chordotonal Organs in (Dr. Mary Whitear), 522
Cryomagnetics Laboratory (Mullard), at Oxford, 25
Crystal (Aluminium Single): Borrmann Effect observed in an (Koichi Nakajima and Prof. Shigeyasu Koda), 53
Crystal Chemistry of Simple Compounds of Uranium, Thorium, Plutonium, Neptunium (E. S. Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Crystal Growth in Paraffin (R. J. Jaccodine), 498
Crystal Physics at Cambridge, 25
Crystal Structure of 9:10-Dimethyl-1:2-benzanthracene (Dr. D. Sayre and Dr. P. H. Friedlander), 139
Crystal Structure Determination: Modern Methods of (Manchester College of Science and Technology Summer School in), 201
Crystal Structure Investigation: Vector Space and its Application in (Prof. Martin J. Buerger), *review* by Dr. J. W. Jeffery, 975
Crystal Structure Models: Bibliography on Molecular and (Deane K. Smith), (United States National Bureau of Standards, Monograph No. 14), 903
Crystal Structures of the High-Pressure Forms of Ice—Ice III (Prof. W. Barclay Kamb and Sankar K. Datta), 140
Crystalline Cytochrome b_2: Chemical and Physical Properties of the Small Deoxyribonucleic Acid Component of (Dr. M. D. Montague and Prof. R. K. Morton), 916
Crystalline (Non-) Structure in Solidified Gold–Silicon Alloys (W. Klement jun., R. H. Willens and Prof. Pol Duwez), 869
Crystallization (Principles of Sugar Technology, edited by Pieter Honig, Vol. 2), *review* by H. C. S. de Whalley, 979
Crystallization: Dendritic (D. D. Saratovkin), translated from the Russian by Dr. J. E. S. Bradley, second edition, *review* by A. F. Wells, 93
A New Technique for Following Rapid Rates of (J. H. Magill), 770
Crystallization of a Photosynthetic Reductase from a Green Plant (Dr. R. Hill and Fay Bendall), 417
Crystals: Dendritic Growth of, *review* by A. F. Wells, 93
Ionic-Covalent Bonding in (C. H. L. Goodman), 590
Crystals (Vermiculite), in Water: Macroscopic Swelling of (G. F. Walker), 312
Csaba, Dr. G., and Kapa, Dr. Eszter: Uptake of Heparin by Cells, 711
Cucumber Mosaic Virus Infection Process: Direct Infra-Red Spectral Analysis of the (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Cudkowicz, G., and others: Antileukaemic Activity of Glycyrrhetinic Acid, 607
Culture in Southern Rhodesia: Environment and (Roger Summers), 993
Culture des Tissus Végétaux (Prof. R. J. Gautheret), *review* by A. Allsopp, 976
Culture, Society and Health (Division of Anthropology of the New York Academy of Sciences and the Research Institute for the Study of Man Conference on), 658
Culture (Cell) Genetics of Man: Cytology and (Symposium published by the *American Journal of Human Genetics*), 116
Culture (Clone): Morphogenetics of *Micrasterias americana* in (Prof. Paavo Kallio), 164
Culture (Insect Tissue): Growth by Cell Division in (Dr. B. M. Jones and I. Cunningham), 1072
Culture (Submerged): Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Cultures: Plant Tissue, *review* by A. Allsopp, 976
Cummins, Dr. C. S.: Microbial Systematics, 191
Cunningham, I. (Jones, Dr. B. M., and): Growth by Cell Division in Insect Tissue Culture, 1072
Cup: The Enkomi Silver (Dr. G. F. Claringbull and A. A. Moss), 1051; (Dr. Harold J. Plenderleith), 1052
Cupric β-Diketone Chelates with Heterocyclic Bases: Structure of the 1:1-Adducts of (Dr. D. P. Graddon and E. C. Watton), 1021
Curran, Dr. S. C.: Nuclear Research in the U.S.S.R., *review*, 630
Currents (Ocean), in McMurdo Sound (A. E. Gilmour, W. J. P. Macdonald and F. G. Van der Hoeven), 867
Curves (Amplitude), for Seismic Body Waves: Oscillatory Character of (Dr. J. Vanek and J. Stelzner), 491
Curves (Light), of Meteors (Dr. R. Ananthakrishnan), 675
Cushing, D. H., and others: Echo Sounding Experiments in the Barents Sea, 855
Cuthbertson, Dr. D. P.: Elected an honorary member of the American Institute of Nutrition, 374
Cuticle (Provisional Embryonic), of a Lepidopteran: Occurrence and Function of the (Dr. R. K. Sharan), 1040
Cutteridge, Dr. O. P. D.: Appointed a senior lecturer in engineering at the University of Leicester, 743
Cwm Glas, Crafnant, Nature Reserve (Nature Conservancy), 464
Cybernetics and Management (Stafford Beer), *review* by J. A. Easterbrook, 269
Cyclic Ethers: A New Method for the Synthesis of (L. F. Schmoyer and L. C. Case), 592
Cyclical Changes in the Distribution of the Testis Lipids in the Common Frog, *Rana temporaria* (Dr. B. Lofts and C. Boswell), 708
Cyclones (Southern Atmospheric), and the Whale Feeding Grounds in the Antarctic (Dr. C. W. Beklemishev), 530
Cyclopentadiene: Conversion of, into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy (C. F. Blakely, Dr. R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662; Kinetics and Mechanism (C. F. Blakely and Dr. A. Wassermann), 662
Cyclotron (Stockholm): Modernization of the, 381
Cyprus: The Evolution of the Rural Land Use Pattern in (Dr. Demetrious Christodoulou), *review* by Prof. M. J. Wise, 628
Cyprus Problem: Land Use and the, *review* by Prof. M. J. Wise, 628
Cysteine: Protective Effect of, against Retinal Degeneration induced by Iodate and Iodoacetate (Prof. Arnold Sorsby and Ronald Harding), 608
Cysteine and of Anoxia: Comparison between the Effects of, on the Rate of Mitosis in Lens Epithelium (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Cystine. Formation of D-Penicillamine-Cysteine Mixed Disulphide by Reaction of D-Benzylpenicilloic Acid with (Dr. Bernard B. Levine), 940
Cytochemical Demonstration of Dehydrogenases in Blood and Bone Marrow Cells: Acetone Fixation for the (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85

Cytochemical Demonstration (Selective), of Arginine Groups in Nucleoprotein in the Cell Nucleus (Dr. E. A. Barnard and Dr. L. G. E. Bell), 508
Cytochemical Evidence of the Origin of Lipid Bodies (so-called Golgi Bodies) from Mitochondria (H. C. Chopra), 713
Cytochemistry : Histochemistry and (Société Française d'Histochimie first International Congress on), 29
Cytochrome b_2 (Crystalline) : Chemical and Physical Properties of the Small Deoxyribonucleic Acid Component of (Dr. M. D. Montague and Prof. R. K. Morton), 916
Cytology : International, *review* by the late Prof. J. Bronte Gatenby, 632
  International Review of (edited by Prof. G. H. Bourne and Prof. J. F. Danielli), Vol. 8, *review* by the late Prof. J. Bronte Gatenby, 632
Cytology and Cell Culture Genetics of Man (Symposium published by the *American Journal of Human Genetics*), 116
Cytoplasm : The Relationship between Nucleus and—Proceedings of the Symposium held at the Université Libre de Bruxelles, 1958 (edited by Dr. R. J. C. Harris), *review* by Dr. E. N. Willmer, 450
Cytoplasm dissociated from the Giant Amoeba, *Chaos chaos* : Streaming in (Prof. R. D. Allen, J. W. Cooledge and P. J. Hall), 896
Cytoplasmic Division in *Amoeba proteus* : Suppression of (Dr. Edmund Guttes and Sophie Guttes), 520
Cytoplasmic Particles and their Role in Protein Synthesis (Colloid and Biophysics Committee of the Faraday Society Informal Discussion on), 643
Cytotoxic Change (Local), in Man from Griseofulvin : Absence of (Prof. Leon Goldman, Amanda Beyer and Jan Schwarz), 335
Czechoslovak Academy of Science : International Conference on Semiconductor Physics, 29
Czechoslovak Republic : Climatic Atlas of the, *review* by G. A. Bull, 543
Czerski, P., and others : Identification of Transplanted Bone Marrow Cells in Radiation Chimaeras, 955

DAGLEY, Dr. S., and Sykes, J. : Cytoplasmic Particles and their Role in Protein Synthesis (One Effect of Chloramphenicol on Micro-organisms is to inhibit Protein Synthesis), 644
Dahl, Ingerlise : The Oligochaete Fauna of Three Danish Brackish Water Areas (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A. J. Southward, 360
Daily Food Consumption by South African University Students (Sonia E. Walker), 381
Dainton, Prof. F. S., and others : Effects of Linear Energy Transfer on the Radiolysis of Water and Heavy Water, 475
Dairying, National Institute for Research in : Report for 1959, 909
Dakar (Senegal) : Haptoglobin Types in 398 Blood Donors from (Dr. J. Moullec, Dr. J. M. Fine and J. Linhard), 517
Damage to Liver induced by DL-Methionine-Ethylester (I. Fehér, F. V. Selmeczi, K. Szalay and Dr. T. Kemény), 421
Damage (X-Ray), in Diploid Yeast : Dye-sensitized Photo-reactivation of (Dr. David Freifelder and Prof. Robert B. Uretz), 953
Dammin, Prof. G. J., and others : Homotransplant Antigens—Preparation of Active Cellular Fractions, 774
Dancis, Joseph, and others : Delayed-type Hypersensitivity in Premature Neonatal Humans, 1130
Dancy, T. E., and Robinson, E. L. (edited by) : Flat Rolled Products—Rolling and Treatment, *review* by Prof. F. C. Thompson, 273
Dangerous Concept of the Natural Forest (T. R. Peace), 848
Danielli, Prof. J. F. (edited by Prof. G. H. Bourne and) : International Review of Cytology, Vol. 8, *review* by the late Prof. J. Bronte Gatenby, 632
Daniels, Dr. Fred B. : Radar Determination of the Scattering Properties of the Moon, 399
Daniels, Dr. N. W. R., and Richmond, J. Wendy : Gas Liquid Chromatography of Conjugated Fatty Acids, 55
Danish Atomic Energy Commission : Third Annual Report (1958-59), 33
Danish Brackish Water Areas : The Oligochaete Fauna of Three (Ingerlise Dahl), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A. J. Southward, 360
Danish Deep-Sea Expedition round the World, 1950-52 : Galathea Report—Scientific Results of the (edited by Dr. Anton Bruun, Capt. Sv. Greve and Prof. R. Spärck), *review* by Dr. N. B. Marshall, 443
Dark-ground Viewing of 'Thorotrast' in Tissue Sections : Combined Oil-immersion, Phase-contrast and (Dr. E. W. Baxter), 162
Darkness : Effects of Light and, on the Rhythm of Output of Carbon Dioxide of Excised Bryophyllum Leaves (Dr. Malcolm B. Wilkins), 523
Darlington, Prof. C. D. : Chromosomes and the Theory of Heredity, 892
Dart, Prof. Raymond A. : Africa's Place in the Emergence of Civilisation (Van Riebeeck Lectures of the South African Broadcasting Corporation), *review* by M. C. Burkitt, 891
Dart, Prof. Raymond A., with Dennis Craig : Adventures with the Missing Link, *review* by Sonia Cole, 888
Darwin's Notebooks on Transmutation of Species (edited by Sir Gavin de Beer), (British Museum (Natural History)) Part 2, 26 ; Part 3, 649
Darwinism (Twentieth Century) : Genetics and (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 24), *review* by Dr. H. Kalmus, 726
Dasarathy, C. (Ramachandran, E. G., and) : Stabilization of Austenite by Hydrogen, 684
Data (Numerical) : Tables of Constants and, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids (Prof. J.-P. Mathieu and Prof. M.-M. Janot), *review* by Dr. J. Walker, 7
Data (Solubility) : Analysis of, to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber (L. Mullins and D. T. Turner), 145
Data Transmission (Benelux Section of the Institute of Radio Engineers, in co-operation with the Nederlands Radiogenootschap and the Group on Communications Systems of the Institute of Radio Engineers International Symposium on), 290
Datta, Sankar K. (Kamb, Prof. W. Barclay, and) : Crystal Structures of the High-Pressure Forms of Ice—Ice III, 140
Daudel, R., and others : Quantum Chemistry—Methods and Applications, *review* by Prof. H. C. Longuet-Higgins, 541
'Dauer-pupa' of the Silkworm, *Bombyx mori* : Function of the Corpus Allatum in the (Dr. Masatoshi Kobayashi), 346
Davey, Prof. T. H. : Parasites as Enemies and Allies, 203
David, D. J. : Atomic Absorption Spectrophotometric Determination of Molybdenum and Strontium, 1109
Davidsohn, Israel, and others : Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of Rabbit Anti-Mouse Erythrocyte Serum, 157
Davidson, Prof. C. F. : Age of the Cambrian System, 1020
Davidson, J. M. : Awarded a Nature Conservancy Diploma Course in Conservation and Ecology at University College, London, 742
Davidson, Dr. W. : Interpretation of Cosmology, 583
Davies, A. B. Oldfield : Science Broadcasting in Sound and Television (Presidential Address to Section X (Assembly of Corresponding Societies) of the British Association for the Advancement of Science), 850
Davies, A. J. S., and Doak, Sheila M. A. : Fate of Homologous Adult Spleen Cells injected into New-born Mice, 610
Davies, Dr. D. R. : Appointed to the newly created chair of applied mathematics in the University College of North Wales, Bangor, 197 ; work of, 197
Davies, J. B. : Use of Dieldrin in the Control of *Glossina palpalis* (R-D) in Nigeria, 84
Davies, J. B., and others : Attachment of Immature Simuliidae to other Arthropods, 618
Davies, Dr. J. Griffiths : Food and Animal Production Overseas (Pasture Development of Tropical Australia), 1071
Davies, Dr. R. D., and others : A New Limit to the Galactic Magnetic Field set by Measurements of the Zeeman Splitting of the Hydrogen Line, 1088
Davies, Dr. R. O. : Solid State Physics, *review*, 886
Davies, Dr. William : Pastoral Systems in relation to World Food Supplies (Presidential Address to Section M (Agriculture) of the British Association for the Advancement of Science), 849
Dawes, Dr. Ben : Classification of the Cestodes of Vertebrates, *review*, 723
Dawson, Barbara : Use of Collagenase in the Characterization of Pseudocoelomic Membranes of *Ascaris lumbricoides*, 798
Day, G. J. : Weather Problems in Agriculture (Radiation Climatology), 995
Day, Prof. J. H. : Polychaete Fauna of South Africa, Part 5, 199
DDT : The First Decade of, *review* by Prof. D. S. Bertram, 271
DDT—the Insecticide DDT and its Significance (edited by Paul Muller), Vol. 2, Human and Veterinary Medicine (Dr. W. J. Hayes, Jr., Dr. S. W. Simmons and Dr. E. F. Knipling), (edited by Dr. S. W. Simmons), *review* by Prof. D. S. Bertram, 271
de Beer, Sir Gavin (edited by) : Darwin's Notebooks on Transmutation of Species, (British Museum (Natural History)), Part 2, 26 ; Part 3, 649
de Castro, Sisinio (Planas, Prof. Jose, and) : Serum Iron and Total Iron-binding Capacity in certain Animals, 1126
de Duve, Prof. C. : Cytoplasmic Particles and their Role in Protein Synthesis (Limits of Resolving Power of Techniques of Cell Fractionation), 634
  Intracellular Localization of Enzymes, 836
DeEds, F., and others : Excretion of Catechol after Ingestion of Quinic and Shikimic Acids, 691
de Keghel, Dr. Maurice : Traité Général de Fabrication des Colles des Glutinants et Matières d'Apprêts, *review* by Prof. A. G. Ward, 890
de Klerk, H. C., and others : Host-Range of *Lactobacillus* Bacteriophages, 348
de Koninck, Prof. Charles : The Hollow Universe, (Whidden Lectures, Series 4), *review* by F. I. G. Rawlins, 890
de Maere, X., and others : Isotopic Composition and Temperature of Formation of Antarctic Snows, 857
de Pasqualini, C. D., and others : Fertility of Mice treated with Phosphorus-32, 876
DeWald, H. A., and others : Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin, 773
de Whalley, H. C. S. : Principles of Sugar Technology, *review*, 979
de Wilde, Prof. J. (Van Wyk, Prof. W. R., and) : Problems of the Arid Zones (Microclimatology, physical and biological), 295
Deacon, Dr. G. E. R. : Studies in Marine Physics, *review*, 183
  The Indian Ocean Expedition, 561
  Submarine Geology, *review*, 629
'DEAE'-Cellulose : Chromatography of Blood Thrombokinase on (Dr. J. H. Milstone), 1127
Dean, Dr. R. A. : *Obituary* of Dr. S. F. Birch, 111
Debnam, A. H. : Minor Elements in Soils, *review*, 629
Debris (Nuclear Weapon) : Fractionation of (Prof. C. Sharp Cook, R. L. Mather, R. F. Johnson and F. M. Tomnovec), 1100
Decade (The First), of DDT, *review* by Prof. D. S. Bertram, 271
Decay of Timber : Combating the, *review* by Prof. F. W. Jane, 977
Decay of Timber and its Prevention (K. St. G. Cartwright and W. P. K. Findlay), *review* by Prof. F. W. Jane, 977
Decimal Coinage and the Metric System—Should Britain Change ? (A Joint Report of Committees appointed by the British Association for the Advancement of Science and the Association of British Chambers of Commerce), 30
Decimal System in Britain, 30
Decreased Membrane Conductance : Excitation at the Crayfish Neuromuscular Junction with (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
Dedifferentiation in *Splachnum ampullaceum* (L.) Hedw : Intracellular Configuration and (Prof. Kraft E. von Maltzahn and Mary M. MacNutt), 344
Dedijer, S. : Scientific Research and Development—a Comparative Study, 458
De-embryonated Eggs : Physical Incompleteness of Influenza Virus propagated in (Martin Hanig and Joseph M. Stein), 40
Deep-Sea Expedition (Danish), round the World, 1950-52 : Galathea Report—Scientific Results of the (edited by Dr. Anton Bruun, Capt. Sv. Greve and Prof. R. Spärck), *review* by Dr. N. B. Marshall, 443
Deer : Sickling Phenomenon in (E. Undritz, K. Betke and Dr. H. Lehmann), 333
Defence Research and Development : British, 177

Defense, United States Department of (Department of the Navy, Naval Research Advisory Committee) : Basic Research in the Navy (Report prepared by Arthur D. Little, Inc.), 178
Deficiency (Low-Grade Mental), in a Large Swedish Rural Population : A Clinical and Genetico-Statistical Study of Schizophrenia and (Bertil Hallgren and Torsten Sjogren), 298
Deficiency (Pyridoxine), in Rats : Polyenoic Acid in Hypercholesterolaemia induced by (Ajit Goswami and Prof. D. P. Sadhu), 786
Deficient Characters (New), in Streptomycin-resistant Mutants of *Bacillus subtilis* : Appearance of (Masamichi Kohiyama and Yonosuke Ikeda), 168
Deformed Metals (Plastically) : A Possible Origin of Exo-Electron Emission in (Dr. A. H. Meleka and W. Barr), 232
Degenerating Nerve Fibres in Birds : Effect of Cortisone on (Dr. P. Glees), 327
Degeneration (Retinal), induced by Iodate and Iodoacetate : Protective Effect of Cysteine against (Prof. Arnold Sorsby and Ronald Harding), 608
Degradation of Benzylpenicillin at pH 7·5 to D-Benzylpenicilloic Acid (Dr. Bernard B. Levine), 939
Degradation of Deoxyribonucleic Acid by Ionizing Radiations : Role of Oxygen in the Cross-linking and (Peter Alexander and J. T. Lett), 933
Degradation (Proteolytic), of Human γ-Globulin : Presence of Immunologically Active Fragments after (L. A. Hanson and B. G. Johansson), 599
Degradation (Thermal), of Polymers : High-Temperature Resistance and (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 466
Dehydrogenase (Steroid 11 β-ol), in Human Placenta (Dr. P. A. Osinski), 777
Dehydrogenases in Blood and Bone Marrow Cells : Acetone Fixation for the Cytochemical Demonstration of (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Dehydrogenases (17β-Œstradiol) : Histochemical Localization of Human, Term Placental—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Deightoniella torulosa (Syd.) Ell : Banana Fruit-spot ('Speckle') caused by (Dr. D. S. Meredith), 961
De-iodination (Enzymic), of Thyroxine : Transiodination of Proteins during (Dr. J. R. Tata), 1025
Del Vecchio, Prof. A., and Bolis, L. : Depressing Activity of Meprobamate on the Reticulo-Endothelial System, 513
Delayed 'Primary' Effects in *Chara vulgaris* L. subjected to X-Rays (C. M. Gillet), 874
Delayed Recovery of Airborne *Serratia marcescens* after Short-Time Exposure to Ultra-violet Irradiation (Dr. R. L. Dimmick), 251
Delayed-type Hypersensitivity in Guinea Pig Embryos : Development of (Jonathan W. Uhr), 957
Delayed-type Hypersensitivity in Premature Neonatal Humans (Jonathan W. Uhr, Joseph Dancis and Charlotte Grantz Neumann), 1130
Delayed-type Iso-hypersensitiveness : Natural Occurrence of (Dr. Jack R. Battisto), 69
Deliwala, Dr. C. V., and others : Diuretic Activity of 2-Amino-4-meta-chloroanilino-1,3,5,triazine (*R*-37), 1034
δ-Lactone Compound : Isolation of a, from the Leaves of *Clitoria mariana* Linn. (Dr. A. Sinha), 149
Demand (Growing), for Water : Second Report of the Sub-Committee on (Central Advisory Water Committee), 198
Demography (Peter R. Cox), third edition, *review* by Prof. E. Grebenik, 97
Demonstration (Cytochemical), of Dehydrogenases in Blood and Bone Marrow Cells : Acetone Fixation for the (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Demonstration (Histochemical), of Acid Phosphatase : A Simple Azo-Dye Method for (Dr. Tibor Barka), 248
Demonstration (Immuno-electrophoretic), of Precipitating Components in Sera from Pregnant Women (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
Demonstration (Selective Cytochemical), of Arginine Groups in Nucleoprotein in the Cell Nucleus (Dr. E. A. Barnard and Dr. L. G. E. Bell), 508
Demountable Vacuum Systems : Direct Observation of Surface Contamination formed in (D. E. Bradley), 227
Denatured Haemoglobin and Myoglobin (Native and) : Nature of the Haem-binding Groups in (Dr. Joan Keilin), 365
Dendritic Crystallization (D. D. Saratovkin), translated from the Russian by Dr. J. E. S. Bradley, second edition, *review* by A. F. Wells, 93
Dendritic Growth of Crystals, *review* by A. F. Wells, 93
Denervated Adrenal Medulla of the Rat : Effect of Reserpine on the Nucleotide and Catecholamine Content of the (Prof. Nils-Åke Hillarp), 1032
Denis, H : Electrophoretic Pattern during Amphibian Development, 62
Denmark : Atomic Energy Research in, 34
  Marine Biological Reports from, *review* by Dr. A. J. Southward, 360
Dennell, Prof. R. : Growth and Form in an Insect, *review*, 631
Dennes, E., and others : Zinc Content of Erythrocytes and Leucocytes of Blood of Normal and Leukaemic Subjects, 302
Density of Bacteriophage λ : Mutations affecting the (G. Kellenberger, M. L. Zichichi and J. Weigle), 161
Density (Surface), of Charge : Effect of, on the Physical Swelling of Lithium Montmorillonite (Dr. J. P. Quirk and B. K. G. Theng), 967
Dent, Prof. H. C. : Sixty Years of Progress in English Education (Presidential Address to Section L (Education) of the British Association for the Advancement of Science), 848
Dental Research, 556
Deo, A. V., and others : New Compounds for the Control of Water Evaporation, 870
2-Deoxy-D-glucose : Phosphate Esters produced by Mammalian Skin from (Dr. S. A. Brooks, Dr. J. C. Lawrence and Dr. C. R. Ricketts), 1028
Deoxyribonucleate : Fate of Transforming, following Fixation by Transformable Bacteria, 1 (Dr. Maurice S. Fox and Dr. Rollin D. Hotchkiss), 1002 ; 2 (Dr. Maurice S. Fox), 1004
Deoxyribonucleic Acid : A Bleached Variant of *Euglena gracilis* showing a Doubling of the Content of (Dr. George Brawerman, Carole A. Rebman and Prof. Erwin Chargaff), 1036
  Capacity of Extracts from Prestarved *Escherichia coli* to Incorporate Thymidine into (Dr. Daniel Billen), 1044
  Interaction of Actinomycin with (Prof. J. Kawamata and M. Imanishi) 1112
  Role of Oxygen in the Cross-linking and Degradation of, by Ionizing Radiations (Peter Alexander and J. T. Lett), 933
  Structure, Synthesis and Function of (Société de Chimie Physique Meeting on), 1079
Deoxyribonucleic Acid in Mouse Ascites Cells : Uptake of Thymidine and Synthesis of (Dr. A. R. Crathorn and Dr. K. V. Shooter), 614
Deoxyribonucleic Acid in Thymus Nucleoprotein : Labilization of, after Whole-body Irradiation (Dr. Ulrich Hagen), 1123
Deoxyribonucleic Acid Component of Crystalline Cytochrome b_2 : Chemical and Physical Properties of the Small (Dr. M. D. Montague and Prof. R. K. Morton), 916
Deoxyribonucleoprotein (Water-soluble, Non-fibrous), from Calf Thymus Nuclei (Dr. Richard S. Welsh), 943
Dependence of Cement-Aggregate Bond-Strength on Size of Aggregate (K. M. Alexander and J. Wardlaw), 230
Dependence on Latitude of the Amplitude of the Diurnal Variation of Cosmic Rays (Arne Eld Sandstrom, Eric Dyring and Stig Lindgren), 1099
Dependence on Temperature of the Electrical Resistivity of Thermosetting Polymers (R. W. Warfield and M. C. Petree), 316
Dependence on Temperature of the Interlayer Spacing in Carbons of Different Graphitic Perfection (E. G. Stewart, B. P. Cook and E. A. Kellett), 1015
Deposited (Internally) Americium : Removal of, by Chelating Agents (Dr. F. D. Sowby and Dr. D. M. Taylor), 612
Deposition of Lipids : Role of Mucoid Substances of the Aorta in the (Dr. S. Gerö, Dr. J. Gergely, Dr. T. Dévényi, Dr. L. Jakab, Dr. J. Székely and Dr. S. Virág), 152
Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the Reactor Accident at Windscale in October 1957 (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Depressing Activity of Meprobamate on the Reticulo-Endothelial System (Prof. A. Del Vecchio and L. Bolis), 513
Depression (Bone Marrow), in Murine Leukaemia (James T. Duhig), 71
Derivative of Tetra-substituted Sulphur : Optically Active Forms of a (M. Baresh), 591
Derivatives (Lysergic Acid) : Production of, by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Derivatives (New Bicyclopentyl) : Conversion of Cyclopentadiene into—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy (C. F. Blakeley, Dr. R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662 ; Kinetics and Mechanism (C. F. Blakely and Dr. A. Wassermann), 662
Derivatives (Tetrahydro-1,3-oxazine) : Anti-neoplastic Activity of (Prof. T. Urbański, D. Gurne, S. Slopek, H. Mordarska and M. Mordarski), 426
Descent of Satellite *Sputnik* 3 : Final Months and (B. R. May and D. E. Smith), 456
Design of Semiconductor Devices : The Properties, Physics and (John N. Shive), *review* by Dr. J. R. Tillman, 1058
Design (Nuclear Power Plant) : Evolution of (Sir Christopher Hinton), 1064
Design and Construction of High Pressure Chemical Plant (Harold Tongue), second edition, *review* by Dr. K. E. Bett, 541
Designing for Space Travel, *review*, 884
Desjardins, Paul R. (Rubio-Huertos, Miguel, and) : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of Ultra-thin Sections, 1043
Desneiges, P., and others : Electronic Equipment used in the Nuclear Energy Industry in France, 1076
Detecting Ionospheric Drifts : Possibility of, from the Occurrence of Spread *F* Echoes at Low Latitudes (R. W. Knecht), 927
Detection of Inhibition of Auxin Transport : A Method for the (B. E. S. Gunning), 428
Detector (An Ionization), for Permanent Gases (Dr. J. E. Lovelock), 49
Determination of Fatty Acids of Lower Molecular Weight by Gas Chromatography (Marie L. Vorbeck, Leonard R. Mattick, Frank A. Lee and Carl S. Pederson), 689
Determination of Molecular Structure (P. J. Wheatley), *review* by Dr. J. W. Cook, 812
Determination of Nickel and Cobalt by Atomic Absorption (J. E. Allan), 1110
Determination of Nonanol Residues in Potatoes (W. F. van Vliet and W. H. Schriemer), 235
Determination (Age), of Seals (H. R. Hewer), 959
Determination (Atomic Absorption Spectrophotometric), of Molybdenum and Strontium (D. J. David), 1109
Determination (Colorimetric), of Traces of Metals (Prof. E. B. Sandell), third edition, *review* by A. M. G. Macdonald, 3
Determination (Crystal Structure) : Modern Methods of (Manchester College of Science and Technology Summer School in), 201
Determination (Polarographic), of the Lanthanides : Use of Azo Dyestuffs for the (T. M. Florence and L. E. Smythe), 771
Determination (Radar), of the Scattering Properties of the Moon (Dr. Fred B. Daniels), 399
Determination (Structure), with the Help of Proton Magnetic Resonance Spectroscopy (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely, Dr. R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Determined (A Genetically) Enzyme in the Pig (Dr. K.-B. Augustinsson and Dr. B. Olsson), 924
Determining Diffusion Coefficients in Liquid Systems by the Diaphragm-Cell Technique : Equations for (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Detoxication Mechanisms (Prof. R. Tecwyn Williams), second edition, *review* by Prof. E. Boyland, 94
Deuchars, Dr. W. : Awarded the Selby Fellowship for 1960, 464
Deutsche Akademie der Naturforscher Leopoldina : Election of Prof. Adolf Butenandt as an honorary member, 117
  Election of new Members, 1079

Deuterium Oxide : Ultra-violet Absorption Spectra of Proteins in (Dr. Shiro Takashima), 597
Developing World : Our (Prof. L. Dudley Stamp), *review* by M. K. Milne, 816
Development : British Defence Research and, 177
  Scientific Research and—a Comparative Study (S Dedijer), 458
  Shortages of Scientific Personnel in European Countries in Process of, 565
Development of Delayed-type Hypersensitivity in Guinea Pig Embryos (Jonathan W Uhr), 957
Development in Fuel and Power : Advisory Council for Research and, 286
Development of the Gonads in Parasitic and Non-Parasitic Lampreys (M W Hardisty), 341
Development of Mouse Eggs beneath the Kidney Capsule (D. R. S. Kirby), 707
Development of Pulp and Particle Board Industries and their Effect on Forest Management (Society of Foresters of Great Britain Discussion on), 32
Development (Aeronautical Research and), Advisory Group for—*see under* AGARD
Development (Amphibian) Electrophoretic Pattern during (H. Denis), 62
Development (Materials Research and), for National Security . More Effective Organization and Administration of (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Development (Research and), in Industry (Dr. E J. Solvay), 830
Development (Overseas) · Assistance from the United Kingdom for (H.M. Treasury), 266
Development (Reconstruction and), International Bank for Articles of Agreement of the proposed International Development Association, as approved for submission to Governments by the Executive Directors of the, 266
Development (Social), through the Family and Home : Report of the Conference on, 567
Development and Growth, Society for the Study of Seventeenth Symposium—Cell Organism and Milieu (edited by Prof Dorothea Rudnick), *review* by Dr. E. N Willmer, 450
Development Association (International) Articles of Agreement as approved for submission to Governments by the Executive Directors of the International Bank for Reconstruction and Development, and Accompanying Report of the Executive Directors, 266
Development Corporation (Colonial) : Annual Report for 1959, 854, 971
Developmental Stages of the Rice Plant . Relative Lengths of Leaf Sheath and Blade with reference to the (Dr. B Saha), 259
Developments of the Optical Lever · Some (Prof R V Jones), 905
Dévényi, Dr. T , and others . Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152
Devices (Semiconductor) . The Properties, Physics and Design of (John N. Shive), *review* by Dr. J R. Tillman, 1058
Devins, J. C., and LeBlanc, jun , O. H. · Ionization and Attachment Coefficients in *n*-Alkyl Chloride Gases, 409
Devonshire : Recapture in the River Tweed of a Sea-Trout marked in (A Swain, L R H. Allan and M J. Bulleid), 877
Dewey, Dr D L : Effect of Glycerine on the X-Ray Sensitivity of *Serratia marcescens*, 1008
'Dex' or 'Order of Magnitude' ? (Prof. J. B. S. Haldane), 879
Dextran and Insulin in Rats (Dr. L H. Marshall and C H. Hanna), 1118
Diabetes Mellitus · High-Energy Bound Phosphate and (Dr Yoshio Goto, Isao Ito, Akihiko Kuwano and Yukio Ujile), 702
Diamagnetic Moment of Gaseous Plasmas measured by Spin Resonance Techniques (T C. Marshall, R. A. Kawcyn and Prof. L. Goldstein), 584
Diamond Physics (Institute of Physics and the Physical Society Conference on), 905
Diapause (Imaginal), in *Coccinella 7-punctata* L. : Prevention and Artificial Induction of the (I Hodek and J Cerkasov), 345
Diaphragm-Cell Technique · Equations for Determining Diffusion Coefficients in Liquid Systems by the (F. A. L Dullien and Prof L. W. Shemilt), 767
Dias, H. F , and others : Sap-Transmissible Viruses associated with Diseases of Grape Vines in Europe and North America, 577
Diazines · Ultra-violet Absorption Spectra of the (Prof K. Keith Innes, James A. Merritt, Wayne C. Tincher and Shelby G Tilford), 500
Dibenzene Chromium · Character of the Ligands in (Dr F Jellinek), 871
Dichapetalum Fluorine Compounds in Nature—the Distribution of Carbon-Fluorine Compounds in some Species of (Sir Rudolph Peters and R J. Hall), 573
Dichorial One-Egg Twins in the Mouse (Dr. A J Bateman), 339
Dickens, P. G , and others : Recombination of Oxygen Atoms in the Gas-Phase, 686
Dickinson, Dr D. R. : Science for the Family, *review*, 978
Dictionaries : Communications and Electronics, *review* by Dr. R. L. Smith-Rose, 1059
Dictionaries (Japanese Scientific and Technical Books and) · A collection of, presented to the Science Museum Library, London, on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
Dictionary : Elsevier's Telecommunication, in Six Languages—English/American, French Spanish, Italian, German, Dutch (compiled and arranged on an English alphabetical base by A. Visser), *review* by Dr. R L. Smith-Rose, 1059
Dictionary of Electronics and Wave-guides : Swedish Supplement to Elsevier's (W E. Clason), *review* by Dr R. L Smith-Rose, 1059
Didelphus virginianam (Opossum) : Wound Healing in the New-Born (Prof. Matthew Block), 340
Dieldrin · Use of, in the Control of *Glossina palpalis* (R-D) in Nigeria (J. B. Davies), 84
Dielectric Liquids Photo-Injection of Charge into (M. J Morant), 48
Dielectrics · Digest of Literature on, Vol 22, 1958 (edited by R. A Sodermann and L F Frisco), (United States National Academy of Sciences—National Research Council, Publication No 713), *review* by S. Weintroub, 728
Diet (Fat) · An Inverse Relation between the Liver Glycogen and the Blood Glucose in the Rat adapted to a (Dr P A. Mayes), 325
Diet (Meat) · Lack of Haematopoietic Potency of Liver of Mice fed on a (Judith Ilan and Prof. K. Guggenheim), 698
Diethylamide (Lysergic Acid) : Effect of, on Larval Growth (Dr. D. V. Siva Sankar, Arthur Kopelman, Peter Schilder and Eleanor Gold), 153
Diethylstilboestrol . Effect of Three Compounds related to, on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
Diets of varying Protein Content : Urinary Amino-Acid Pattern of Cats on (Dr J. P. Greaves and Dr. Patricia P. Scott), 242
Difference between the Sub-Units of Tobacco Mosaic Virus Protein ? (Dr. H G Aach), 75
Difference between Two Means : Significance of the, when the Population Variances may be Unequal (John B de V Weir), 438
Differences (Platelet-Count) in Blood of the Rabbit Right and Left Heart Ventricles (Dr. J. George Sharnoff and Dr. Vito Scardino), 334
Differences (Race), in the Ability to excrete Beetroot Pigment (Betanin), (Dr P. H Saldanha, L E. Magalhaes and Wanda A Horta), 806
Differences (Strain), in Acetylcholine Concentration in the Brain of the Rat (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Different Graphitic Perfection : Dependence on Temperature of the Interlayer Spacing in Carbons of (E. G. Steward, B. P Cook and E. A. Kellett), 1015
Different Types of Malnutrition : Influence of, on the ^{14}C-Lysine Metabolism in Young Rats (Prof. Kurt Schreier and Corinna Kazassis), 1117
Differential Equations : Boundary Problems in—Proceedings of a Symposium conducted by the Mathematics Research Center of the United States Army at the University of Wisconsin, 1959 (edited by Prof. Rudolph E. Langer), *review* by Prof E T Copson, 451
Differential Precipitation of Nucleic Acids from Aqueous Solutions : A New Method for the (William G. Aldridge), 323
Differential Reactivity of Saliva from 'Tasters' and 'Non-Tasters' of 6-*n*-Propylthiouracil (Frances Griffin and Prof. Roland Fischer), 417
Differential Thermal Analysis of some Transition Metal Ethylenediamine Tetraacetic Acid Chelates (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Differentiation in *Peronospora tabacina* Adam. (Dr. D. C. Wark, A V. Hill, M. Mandryk and I A. M. Cruickshank), 710
Differentiation (Immuno-Electrophoretic), of Haptoglobins from another Group-Specific Inheritable System in Normal Human Sera (Dr. Jan Hirschfeld), 126
Diffraction (Mellon Institute, Pittsburgh, Conference on), 650
Diffusion of Knowledge (Dr Michael Grant), 371
Diffusion Coefficients in Liquid Systems by the Diaphragm-Cell Technique : Equations for determining (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Diffusion ('Eddy'), in Chromatography (A. Klinkenberg and F. Sjenitzer), 1023 · (J. Calvin Giddings) 1023
Diffusion (Self-) of Alkali Metal Ions in Analcite : Energies of Activation for (Prof R. M Barrer and L. V. C Rees), 768
Diffusion (Turbulent), in the Atmosphere Small-Scale (Dr. L. A. Clarenburg and C. E. Spaans-v. d Tang), 586
Digest of Literature on Dielectrics, Vol 22, 1958 (edited by R. A. Sodermann and L. F Frisco), (United States National Academy of Sciences—National Research Council, Publication No. 713), *review* by S. Weintroub, 728
Digestion (Intracellular), in a Histophagous Ciliate : Increase of Esterase Activity during (Dr. Miklós Muller, József Tóth and Prof. Imre Toro), 65
Digital Computer : *Leo III*, a New All-Transistor (Leo Computers, Ltd.), 373
Dihydrocodeine and Aminopyrine Analgesia (Morphine,) : Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J L J. Szabó and M. Stamburgo), *erratum*, 559
β-Diketone Chelates (Cupric), with Heterocyclic Bases . Structure of the 1·1-Adducts of (Dr. D P. Graddon and E. C. Watton), 1021
9 10-Dimethyl-1-2-benzanthracene . Crystal Structure of (Dr. D. Sayre and Dr. P. H. Friedlander), 139
Dimitriadou, A., and others : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thioureas or Thiouracils, 691 ; *erratum*, 1079
Dimmick, Dr R L. · Delayed Recovery of Airborne *Serratia marcescens* after Short-Time Exposure to Ultra-violet Irradiation, 251
Dinning Prof James S (Fitch, Coy D., and) Production of Muscular Weakness in Rats by a Creatine Analogue, 421
Diodone · Use of, in Renal Studies in Sheep (B. J. Pitter), 698
Dioxide (Carbon) : Effects of Light and Darkness on the Rhythm of Output of, of Excised *Bryophyllum* Leaves (Dr. Malcolm B Wilkins), 523
Dioxide (Carbon) Mass Spectra . High-Energy Oxygen Ions in (R. M. S. Hall), 683
Dioxide (Carbon) Output : Effect of Electronarcosis on Oxygen Consumption and (Dr. Jaroslav Strmiska and Dr. Antonín Vacek), 151
Diphosphopyridine Nucleotide : Synthesis of, in Irradiated Rats (Dr D. K. Myers), 1124
Diphtheria and Tetanus · Vaccination against Whooping Cough (Research Defence Society, *Conquest* Pamphlet No. 11), 649
Diplococcus pneumoniae : Transformation of Resistance to 8-Azaguanine in (Francis M. Sirotnak, Ramona B Lunt and Dorris J. Hutchison), 800
Diplodiscus Species Parasitic in the Snail *Paludina vivipara* Lm. (M. R. Honer), 431
Diploid Yeast : Dye-sensitized Photoreactivation of X-Ray Damage in (Dr. David Freifelder and Prof Robert B Uretz), 953
Diphosphate (Adenosine) . Oxidative Phosphorylation—Synthesis of, by the Oxidation of Quinol Phosphates (Dr. V. M. Clark, D. W. Hutchinson and Sir Alexander Todd), 59
Diploma in Mathematics (Mathematical Association), 114
Diptera (Euryhaline) . Osmotic Regulation in the Larvae of some (D. W. Sutcliffe), 331
Direct Action on Metabolism : Polypeptides of the Human Pituitary with (Dr J Bornstein and Deirdre Hyde), 125
Direct Infra-Red Spectral Analysis of the Cucumber Mosaic Virus Infection Process (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Direct Observation of Surface Contamination formed in Demountable Vacuum Systems (D. E. Bradley), 227

Direction and Supervision of Scientific and Engineering Personnel (Northampton College of Advanced Technology, London, Advanced Course on), 905
Directive Rotating Array (A Highly), for 16 Mc./s. (Prof. J. A. Thomas and Dr. R. W. E. McNicol), 398
Directory of Libraries in the United Kingdom with access to 'Telex' (Library Association), 558
Discharge (Sceptre): Periodic Magnetic Field Fluctuations in the (Dr. N. L. Allen), 279
Discharges (Electrical), in the Solar Atmosphere: Temperatures reached in (Dr. C. E. R. Bruce), 865
Discontinuity (The Sudden), in the Orbital Period of *Sputnik* 4 Satellite (B. R. May and D. E. Smith), 866
Discoverer Satellites: Recovery of Capsules from, 741
Discovery: Appointment of S. Edward Gamarekian as Editor, 741
Discovery (Possible), of Ion-Pairs by Interferometry (Prof. R. N. O'Brien and C. Rosenfield), 935
Discrimination (Visual): Problems of (Prof. R. W. Ditchburn), 854
Disease: Achievement—some Contributions of Animal Experiment to the Conquest of (Dr. Geoffrey Lapage), *review* by Dr. W. Lane-Petter, 977
Disease (Gall), of Cocoa: Transmission of a (A. L. Wharton and A. A. Brunt), 80
Disease (Muscular) Myasthenia gravis (E. R. Bickerstaff and A. L. Woolf), 28; (Violet MacDermot), 28
Disease (Streak-Virus), of Tomatoes (B. H. MacNeill and Hikmet Isman), 903
Diseases of Grape Vines in Europe and North America: Sap-Transmissible Viruses associated with (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
Diseases (Staphylococcal): Antibiotic Therapy and (edited by Dr. Henry Welch and Prof. Maxwell Finland), *review* by Prof. R. Knox, 637
Diseases (Talfan and Teschen): Infective Ribonucleic Acid from the Viruses of (F. Brown and Doreen L. Stewart), 714
Dislocations: Electron Microscope Images of (Dr. Hatsujiro Hashimoto and Dr. Kazuo Fujita), 51
Dislocations in Layer Structures (V. A. Phillips and P. Cannon), 313
Dispersed Chemical Elements (Rare and), in Soils: The Geochemistry of (A. P. Vinogradov), second edition (translated from the Russian), *review* by A. H. Debnam, 629
Dispersion in Space of Small Bodies (Dr. D. O. Wolfenbarger), 1078
Disposition of Noradrenaline labelled with Tritium: Effect of Cocaine on the (Dr. L. G. Whitby, G. Hertting and Dr. J. Axelrod), 604
Dissection: Recognition of Nulliparous Mosquitoes without (Dr. Philip S. Corbet), 525
Dissociation (Reversible), of Ribonucleic Acid (R. A. Brown, K. A. O. Ellem and Dr. J. S. Colter), 509
Dissociation Energy of S_2: Mass Spectrometric Investigation of the Vaporization of Sulphides and the (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Distance from the Source of Sodium Chloride: Change of the Chlorine–Sodium Ratio in the Atmosphere with Altitude and, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Distèche, A.: pH Changes during Muscle Twitch and Tetanus, 1119
Distorted Wave Approximation for Scattering Phase-Shifts (Dr. P. Swan), 585
Distribution of Atmospheric Nitrate over the United States: Change of the Chlorine–Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Distribution of Atmospheric Ozone—a Preliminary Analysis of some International Geophysical Year Observations (J. MacDowall), 382
Distribution of Carbon–Fluorine Compounds in some Species of *Dichapetalum*: Fluorine Compounds in Nature—the (Sir Rudolph Peters and R. J. Hall), 573
Distribution of Protein-bound Aminoazo Dyes in the Rat Liver Microsome (Dr. T. Yamada, M. Matsumoto, S. Kanda and Prof. H. Terayama), 943
Distribution of Sucrose in the Rat's Ventricle: Effect of Nitrate Ion on the (S. T. Taketa, C. G. Alexander and Prof. G. A. Feigen), 419
Distribution of the Testis Lipids in the Common Frog, *Rana temporaria*: Cyclical Changes in the (Dr. B. Lofts and C. Boswell), 708
Distribution of Thyrotrophin labelled with Iodine-131: Sialoadenectomy and the (Prof. Arthur W. Wase and Dr. Yu Sheng Louise Feng), 778
Distribution (Parallel), of Calcium and Citric Acid in the Oviduct of the Hen (Dr. T. G. Taylor and F. Hertelendy), 244
Distribution (Quantitative and Qualitative), of Zooplankton in the Southern Part of the Norwegian Sea: Investigations on the (V. K. Hansen), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A. J. Southward, 360
Disulphide Bond in Wool: Reactivity of the (Dr. L. J. Wolfram and Prof. J. B. Speakman), 595
Disulphide (D-Penicillamine-Cysteine Mixed): Formation of, by Reaction with D-Benzylpenicilloic Acid with Cysteine (Dr. Bernard B. Levine), 940
Ditchburn, Prof. R. W.: Problems of Visual Discrimination (Twentieth Thomas Young Oration of the Physical Society), 854
Diuretic Activity of 2-Amino-4-metachloro-anilino-1,3,5,triazine (R-37), (D. J. Mehta, Prof. U. K. Sheth and Dr. C. V. Delwala), 1034
Diuretic (Anti-) Hormone and Calcium: Effect of, on the Equivalent Pore Radius of Kidney Slices from *Necturus* (G. Whittembury, N. Sugino, and Dr. A. K. Solomon), 699
Diuretic (Benzothiadiazine): A Potent New (Dr. Richard M. Taylor and Martin M. Winbury), 603
Diurnal Variation of Cosmic Rays: Dependence on Latitude of the Amplitude of the (Arne Eld Sandström, Eric Dyring and Stig Lindgren), 1099
Divergence: The Antarctic Convergence—and (Dr. K. Wyrtki), 581
  Evolutionary, *review* by C. S. Elton, 446
Divided Self: The—a Study of Sanity and Madness (Dr. R. D. Laing), *review* by Dr. Clifford Allen, 1062
Division (Cytoplasmic), in *Amoeba proteus*: Suppression of (Dr. Edmund Guttes and Sophie Guttes), 520
Dixey, Dr. F. A.: Arid Zone Problems, 295
  Problems of the Arid Zones (Geology, Geomorphology and Ground-Water Hydrology), 295
Dixon, Dr. R. N.: Appointed lecturer in chemistry at the University of Sheffield, 466
Djerassi, Prof. C.: The Chemistry of Natural Products (Application of Optical Rotatory Dispersion Studies to Problems in Natural Products Chemistry), 1080
D_2O (Molecules H_2O, HDO and): Ultra-violet Absorption Spectra of the (Dr. Jack Barrett and Dr. A. L. Mansell), 138; (R. M. Golding), 139
Doak, Sheila M. A. (Davies, A. J. S., and): Fate of Homologous Adult Spleen Cells injected into New-born Mice, 610
Dodd, Dr. J. M.: Appointed to the chair of zoology in the University of Leeds, 197; work of, 197
Dodds, Dr. K. S.: The John Innes Institute, 467
Dog: Topographical Anatomy of the (Dr. O. Charnock Bradley), sixth edition revised by Prof. Tom Grahame, *review* by Prof. T. Nicol, 451
Dog (Man, Horse, Sheep and): Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in comparison with (Dr. C. J. G. van der Horst), 146
Dogs: Effects of Ataractic Drugs on the Blood-Pressure and Heart-Rate of (L. W. Hall and D. E. Stevenson), 696
Doireau, M., and others: Electronic Equipment used in the Nuclear Energy Industry in France, 1076
Dolerites (Quartz-): Stress-Dependent Magnetization in some (Dr. D. W. Powell), 225
Dollery, C. T., and West, J. B.: Metabolism of Oxygen-15, 1121
Domain or Turbostratic Structure of Clays (L. A. G. Aylmore and Dr. J. P. Quirk), 1046
Domestic Fowl: Antibody Responses of the, to Two Soluble Bacterial Antigens (Dr. G. Gowland), 624
Domestic Heating and Thermal Insulation (Building Research Station, Digest 133), 999
Doniach, Dr. I.: Appointed to the chair of morbid anatomy at the London Hospital Medical School, 466
Doniach, Dr. I., and Francois, Dr. P. E.: Comparison of Iodine-124 and Iodine-131 in Inhibition of Goitrogenesis in the Rat, 704
Dorsal Skin Secretion of *Xenopus laevis*: Serotonin, a Melanocyte-stimulating Component in the (Dr. F. C. G. van de Veerdonk), 948
Doses (Excessively Large), of Oral Griseofulvin: Tumour-promoting Effect of, on Tumours induced in Mice by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Doses (Small), of Reserpine: A Suggested Effect on Levels of Catecholamine in Brain produced by (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Doubling of the Content of Deoxyribonucleic Acid: A Bleached Variant of *Euglena gracilis* showing a (Dr. George Brawerman, Carole A. Rebman and Prof. Erwin Chargaff), 1036
Douglas, A.: At the second Annual Conference of the British Computer Society (Language and General-purpose Programmes for Market Research), 655
Douglas, Dr. A. W.: Appointed to a senior lectureship in inorganic and physical chemistry at the University of Liverpool, 117
Douglas, Prof. R. W.: *Obituary* of Prof. H. Moore, 1074

Echo Sounding Experiments in the Barents Sea (I. D. Richardson, D. H. Cushing, F R. Harden Jones, R. J. H Beverton and R. W. Blacker), 855
F Echoes (Spread), at Low Latitudes : Possibility of Detecting Ionospheric Drifts from the Occurrence of (R. W. Knecht), 927
Ecklonia radiata . Carbohydrates of (C. M. Stewart and H. G. Higgins), 511
Ecological Processes (Dr. Alan Mozley), *review* by W. H. Dowdeswell, 451
Ecology : Research Studentships for postgraduate training in (Nature Conservancy Awards for 1960), 742
Ecology in Australia : Biogeography and (edited by A. Keast, R. L Crocker and C. S. Christian), *review* by Prof. A. J. Marshall, 543
Economic Progress : The Conditions of (Colin Clark), 537
Ectromelia. Effect of a Primary Tuberculous Infection on the Resistance of Male and Female Mice to (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
'Eddy' Diffusion in Chromatography (A. Klinkenberg and F. Sjenitzer), 1023 ; (J. Calvin Giddings), 1023
Editors : Influence of (Scientific Publications Council Discussion on), 120
Edmonds, Dr. D. T. : Appointed by the Royal Society to a Mackinnon Research Studentship at the Clarendon Laboratory, Oxford, 291
Edmondson, Prof. W. T. (edited by) : Fresh-Water Biology (Henry Baldwin Ward and George Chandler Whipple), second edition, *review* by Dr. T. T. Macan, 6
Education : Studies in the History of, 1780-1870 (Brian Simon), *review* by Dr. James L. Henderson, 357
Education in Britain : Science and, 906
Education, Central Advisory Council for—England : Report, Vol. 2, Surveys, 883
Education, Illinois Department of Registration and : Biological Notes No. 41, Population Trends among Hawks and Owls in Illinois (Richard R. Graber and Jack S. Golden), 999
Education, United States Office of (prepared by) : Technical and Vocational Education in the U.S.A.—a Bibliographical Survey (Unesco, Educational Studies and Documents No. 36), 741
Education (Adult), Universities Council for : Report on the Year 1958-1959, 906
Education (Comparative) : Essays in, *review* by Brian Holmes, 635
Education (Engineering), in Russia (S. P. Timoshenko), 537
Education (English) : Sixty Years of Progress in (Prof. H C Dent), 848
Education (Further) : Part-Time Courses in (J. Heywood), 189
Education (Health) : Training of Teachers for (United Nations, World Health Organization, Technical Report Series No. 193), 638
Education (Modern) : Evolution of, *review* by Dr. James L. Henderson, 357
Education (Technical and Vocational), in the U.S A.—a Bibliographical Survey prepared by the United States Office of Education (Unesco, Educational Studies and Documents No. 36), 741
Education (University), in Britain, 719
Education (University), in New Zealand (Prof. V. J. Chapman), 107
Education (University) : The Place of Physiology in (Prof. J. A. B. Gray), 719
Education and Industry, 470
Education and Training of Professional Radio and Electronics Engineers (British Institution of Radio Engineers Report on), 115
Educational Co-operation : Commonwealth (Commonwealth Relations Office, Colonial Office), 441
Educational Co-operation in the Commonwealth, 113, 441
Educational Publications, Ltd , Wakefield : New Filmstrips, 832
Educational Research The Need for, 883
Edvarson, K. (Low, Kerstin, and) Content of Caesium-137 and (Zirconium + Niobium)-95 in Swedish Soils, 736
Edwards, Prof. J. : Nuclear Training Facilities at the Royal Naval College, Greenwich, 545
Effect of Acridine Orange in Living Bull Spermatozoa (C. van Duijn, jun.), 1006
Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of Kidney Slices from *Necturus* (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Effect of some Aromatic Hydroxy Compounds on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, C. Druce and C. C. Ware), 422
Effect of Autumn Applications of Potassium Gibberellate on Fruit Production of the Strawberry (Prof. Carter R. Smith), 620
Effect of *Candida albicans* on the Evolution of Experimental Tuberculosis (Dr. E. Mankiewicz and Dr. M. Liivak), 250
Effect of the Cations of the Lyotropic Series on the Tension of Vascular Muscle (Prof. L. Laszt), 329
Effect of Cocaine on the Disposition of Noradrenaline labelled with Tritium (Dr. L. G. Whitby, G. Hertting and Dr. J. Axelrod), 604
Effect of Cortisone on Degenerating Nerve Fibres in Birds (Dr. P. Glees), 327
Effect of Electric Fields on Hydrogen-like Excitons (J. W. Allen), 51
Effect of Electronarcosis on Oxygen Consumption and Carbon Dioxide Output (Dr Jaroslav Strmiska and Dr. Antonín Vacek), 151
Effect on Forest Management : The Development of Pulp and Particle Board Industries and their (Society of Foresters of Great Britain Discussion on), 32
Effect of Glutathione and Alloxan on the Photoperiodic Response of *Xanthium* (J. Nitsan), 81
Effect of Glycerine on the X-Ray Sensitivity of *Serratia marcescens* (Dr. D. L. Dewey), 1008
Effect of Heat on the Serum Factors Gm^{a}, Gm^{b} Gm^{x} and Gm-like (Prof. Arthur G. Steinberg and Rachel Stauffer), 791
Effect of Heavy Water on Respiratory-chain Enzymes (Dr H. Laser and Prof. E C. Slater), 1115
Effect of Hydration on Hexobarbitone-induced Sleep in Mice (Dr. N. K. Bhide), 1030
Effect of Lysergic Acid Diethylamide on Larval Growth (Dr D. V. Siva Sankar, Arthur Kopelman, Peter Schilder and Eleanor Gold), 153
Effect of 6-Mercaptopurine on the Net *in vitro* Gas Production of Sensitive and Resistant *L*1210 Mouse Leukaemia Cells (Dr. H. J. Woodliff), 156
Effect of Nitrate Ion on the Distribution of Sucrose in the Rat's Ventricle (S. T. Takata, C. G Alexander and Prof. G A. Feigen) 419
Effect of Penicillin on the Maintenance of Rumen Oligotrich Protozoa (G. S. Coleman), 518
Effect of the Peritoneal Fluid of the Guinea Pig on Strains of Enteric Bacilli (Prof. R. J. Roantree and L. R. Collis), 1045
Effect of Potassium Cyanide Poisoning on the γ-Aminobutyric Acid-Level in the Brain (Dr. T Tursky), 322
Effect of a Primary Tuberculous Infection on the Resistance of Male and Female Mice to Ectromelia (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Effect of Pyruvate upon Nucleated and Enucleated Fragments of *Amoeba proteus* (Dr Edmund Guttes and Sophie Guttes), 432
Effect of Reserpine on the Nucleotide and Catecholamine Content of the Denervated Adrenal Medulla of the Rat (Prof. Nils-Åke Hillarp), 1032
Effect of a Resisting Couple on the Rotational Motion of a Rigid Body (T. Nonweiler), 311

Effect of Ribonuclease on Erythrocyte Antigens (Prof. Emanuel Hackel and Robert E. Smolker), 1036
Effect of Specular Reflexions on the Radiation Flux from a Heated Tube (Sir K. S. Krishnan), 135
Effect of Size of Pupil on Visual Acuity (Dr. F. W. Campbell and Dr. A. H. Gregory), 1121
Effect of Surface Density of Charge on the Physical Swelling of Lithium Montmorillonite (Dr. J. P. Quirk and B. K. G. Theng), 967
Effect of Temperature on the Expansion on Setting of Gypsum Plaster (P. J. Sereda), 929
Effect of Testicular Hyaluronidase on the Permeability of Human Arterial Tissue (Jørgen Matzke), 873
Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
Effect of Trypan Blue on Rat Embryos (F. Beck, Dr. B. Spencer and Prof. J. S. Baxter), 605
Effect of Upper Atmosphere Wind on the Rotation of Satellite 1958δ1 (Dr. C. R. Faulkner), 926
Effect of Variations in Temperature on Meiosis in *Gagea reticulata* Schultes (Dr. C. P. Malik), 805
Effect of Vasoconstrictor Amines : Influence on the, by Pretreatment with Reserpine (H. C. Sabelli), 784
Effect of Wheat Gluten on the Peristaltic Reflex (Dr. R. Schneider, H. Bishop, Dr. B. Shaw and Prof. A. C. Frazer), 516
Effect (Bacterial), and Radiophosphorus Assimilation in Organic and Inorganic Forms in Salmon (Dr. P. N. Srivastava), 83
Effect (Borrmann), observed in an Aluminium Single Crystal (Koichi Nakajima and Prof Shigeyasu Koda), 53
Effect (Cage), in the Liquid-Phase Photolysis of Fluorinated Ketones (R. Bowles, Dr. J. R. Majer and Prof. J. C. Robb), 314,
Effect (Eosinophil Leucocyte-attracting), of Histamine in Skin (Dr. R. K. Archer), 155
Effect (Geoelectric), in Coleoptiles : Electrostatic Measurement of the (Carl Hellmuth Hertz), 320
Effect (Longitude), in Temperate Zone Sporadic E and the Earth's Magnetic Field (L. H. Hessler and Dr. J. D. Whitehead), 676
Effect (An Ortho), influencing Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Effect (Protective), of Cysteine against Retinal Degeneration induced by Iodate and Iodoacetate (Prof. Arnold Sorsby and Ronald Harding), 608
Effect (A Suggested), on Levels of Catecholamine in Brain produced by Small Doses of Reserpine (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Effect (Tumour-promoting), of Excessively Large Doses of Oral Griseofulvin on Tumours induced in Mice by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Effective (More) Organization and Administration of Materials Research and Development for National Security (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Effectiveness in Industry (W. E. Bargett), 378
Effects : The Marangoni (L. E. Scriven and C. V. Sternling), 186
Effects of Ataractic Drugs on the Blood-Pressure and Heart-Rate of Dogs (L. W. Hall and D. E. Stevenson), 696
Effects of Cysteine and of Anoxia on the Rate of Mitosis in Lens Epithelium : Comparison between the (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Effects of Light and Darkness on the Rhythm of Output of Carbon Dioxide of Excised *Bryophyllum* Leaves (Dr. Malcolm B. Wilkins), 523
Effects of Linear Energy Transfer on the Radiolysis of Water and Heavy Water (Dr. E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Effects of Medial Temporal Lesions on Taste Preference in the Monkey (Dr. L. Weiskrantz), 879
Effects of pH and the Nature of the Primary Species in the Radiolysis of Aqueous Solutions (J. T. Allan and Dr. G. Scholes), 218
Effects of Pollution on Living Material (edited by W. B. Yapp), *review* by Dr. G. C. Ware, 1061
Effects of Whole-body Irradiation on the Breeding Plumage of the Weaver Finch, *Quelea quelea* (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Effects (Biological), of Atomic Radiation—Summary Reports from a Study by the National Academy of Sciences (United States National Academy of Sciences—National Research Council), 380
Effects (Biological), of Exposure to Intense Radiation, 910
Effects (Chemical), of Ionizing Radiations on Nucleic Acids and Nucleoproteins (P. Emmerson, Dr. G. Scholes, D. H. Thomson, J. F. Ward and Prof. J. Weiss), 319
Effects (Delayed 'Primary'), in *Chara vulgaris* L. subjected to X-Rays (C. M. Gillet), 874
Effects (Orienting), in Octahedral Aquation (Sir Christopher Ingold, Prof. R. S. Nyholm and Dr. M. L. Tobe), 477
Effluent Liaison : Special Assistance for (British Leather Manufacturers' Research Association), 992
Egg-Yolk Reactions of *Pseudomonas* Species (Dr. A. T. Willis and Dr. G. Gowland), 432
Eggs (De-embryonated) : Physical Incompleteness of Influenza Virus propagated in (Martin Hanig and Joseph M. Stern), 40
Eggs (Mouse) : Development of, beneath the Kidney Capsule (D. R. S. Kirby), 707
Ehmert, Prof. Alfred : Elected a member of the Geophysics section of the Leopoldina Academy of Natural Sciences, 1079
Eighteenth-Century Science : The Transits of Venus—a Study of (Prof. Harry Woolf), *review* by Dr. David S. Evans, 636
Eisenschitz, Prof. R. : Reference Book of Theoretical Physics, *review*, 445
Elasmobranchs : Presence of a Pituitary Portal System in (Patrick Meurling), 336
Elateridae : Pathogenicity of *Metarrhizium anisopliae* (Metch.) Sor. and *Beauveria bassiana* (Bals.) Vuill. to Two Species of (Dr. R. D. Tinline and R. Y. Zacharuk), 794
Elderfield, Prof. Robert C. : Appointed chairman of the Division of Chemistry and Chemical Technology of the United States National Academy of Sciences—National Research Council, 647
Electric Fields : Effect of, on Hydrogen-like Excitons (J. W. Allen), 51
Electric and Magnetic Field : Michael Faraday and the Evolution of the Concept of the (Prof. L. Pearce Williams), 730
Electrical Discharges in the Solar Atmosphere : Temperatures reached in (Dr. C. E. R. Bruce), 865
Electrical Engineering in the Imperial College of Science and Technology, London, 463
Electrical Power Convention (British) : Presidential Address, Electricity—the New Horizon (Viscount Chandos), 557, 831
Electrical Resistivity of Thermosetting Polymers : Dependence on Temperature of the (R. W. Warfield and M. C. Petree), 316
Electrical Sensitivity of the Ampullae of Lorenzini (Dr. R. W. Murray), 957
Electricity—the New Horizon (Viscount Chandos), 557, 831
Electricity and Gas Industries (Coal,) : Capital Investment in the (Ministry of Power), 1055
Electrokinetic Parameters at Metal Surfaces : Simultaneous Measurement of Adsorption and (A. M. Peers), 503 ; (Dr. E. A. Blomgren and Dr. J. O'M. Bockris), 504
Electro-deposit (Chromium) : Hexagonal Modification of Black (Hideya Okada and Takeo Ishida), 496
Electrolysis (The Fusion), of Titanium (Dr. W. J. Kroll), 994
Electrolyte Solutions (Aqueous) : Ultrasonic Velocities in (Dr. C. G. Balachandran), 136
Electromagnetic Standing Waves and Ball Lightning (Dr. Lewi Tonks), 1013
Electromagnetic Waves : Ionospheric Propagation of, *review* by Sir Harrie Massey, 810
Electron Linear Accelerators : Pulse-shortening in (M. G. Kelliher and R. Beadle), 1099
Electron (Exo-) Emission in Plastically Deformed Metals : A Possible Origin of (Dr. A. H. Meleka and W. Barr), 232
Electron Microscope Images of Dislocations (Dr. Hatsujiro Hashimoto and Dr. Kazuo Fujita), 51
Electron Microscopy (Nederlandse Vereniging voor Electronenmicroscopie European Regional Conference on), 29
Electron Microscopy : Use of Ferritin-conjugated Antibody to Localize Antigen by (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094
Electron Microscopy of Ultra-thin Sections : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by (Miguel Rubio-Huertos and Paul R. Desjardins), 1043
Electronarcosis : Effect of, on Oxygen Consumption and Carbon Dioxide Output (Dr. Jaroslav Strmiska and Dr Antonín Vacek), 151
Electronenmicroscopie, Nederlandse Vereniging voor : European Regional Conference on Electron Microscopy, 29
Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin : An Ortho Effect influencing Fungitoxicity, (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Electronic Computers : Research in the Use of (Unesco Fellowships for), 465
Electronic Engineering Association : Awards for articles on Electronics, 116
Electronic Engineering Society (Hull), (Institution of Electronics, with the co-operation of the) : Electronics and Instruments Exhibition and Convention, 650
Electronic Equipment used in the Nuclear Energy Industry in France (P. Desneiges, M. Doireau, L. Koch and J. Weill), 1076
Electronic Figure Reader, 28
Electronic States (Excited), of Lithium and Sodium Molecules (Dr. R. F. Barrow, N. Travis and C. V. Wright), 141
Electronics : Awards for articles on (Electronic Engineering Association), 116
Electronics, Institution of, with the co-operation of the Hull Electronic Engineering Society : Electronics and Instruments Exhibition and Convention, 650
Electronics Dictionaries : Communications and, *review* by Dr. R. L. Smith-Rose, 1059
Electronics Engineers (Radio and) : Education and Training of Professional (British Institution of Radio Engineers Report on), 115
Electronics and Instruments Exhibition and Convention (Institution of Electronics, with the co-operation of the Hull Electronic Engineering Society), 650
Electronics and Waveguides : Swedish Supplement to Elsevier's Dictionary of (W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1059
Électroniques : Les Semiconducteurs (Dr. E. Spenke), traduit par L. Godefroy, *review* by Dr. J. R. Tillman, 1058
Electrophoresis (Starch-Gel), of Wheat Proteins (Dr. G. A. H. Elton and J. A. D. Ewart), 600
Electrophoresis (Zone), of Anthocyanins (Prof. P. Markakis), 1092
Electrophoretic Pattern during Amphibian Development (H. Denis), 62
Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of Rabbit Anti-Mouse Erythrocyte Serum (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Electrophoretic (Immuno-) Differentiation, of Haptoglobins from another Group-Specific Inheritable System in Normal Human Sera (Dr. Jan Hirschfeld), 126
Electrophysiological Observations on a Sound-producing Fish (A. Packard), 63
Electro-shock Seizure Threshold of Metacorticoid Hypertensive Rats (Dr. F. M. Sturtevant), 874
Electrostatic Forces : The Physics of, and their Applications (Centre National de la Recherche Scientifique International Colloquium on), 466
Electrostatic Measurement of the Geoelectric Effect in Coleoptiles (Carl Hellmuth Hertz), 320
Element Relationships (Major), in Tektites (R. D. Cherry, Dr. S. R. Taylor and Maureen Sachs), 680
Elements (Minor), in Soils, *review* by A. H. Debnam, 629
Elements (Rare and Dispersed Chemical), in Soils : The Geochemistry of (A. P. Vinogradov), second edition, (translated from the Russian), *review* by A. H. Debnam, 629
Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed and Prof. Robert C. Brasted, Vol. 7), *review* by Dr. K. W. Bagnall, 185
Ellem, K. A. O., and others : Reversible Dissociation of Ribonucleic Acid, 509
Ellenbogen, Dr. Eric : *Obituary* by Prof. Robert E. Olson, 554

Elliot, Dr. H. E.: Title of professor of physics in the University of London (at the Imperial College of Science and Technology) conferred on, 466
  Grants for Space Research—£7,275 (for satellite measurements of the primary cosmic-ray energy spectrum), and £1,500 (for an investigation into cosmic-ray intensity variations at rocket altitudes), 744
Elliott, Dr. A., and others: Screw Sense of the α-Helix in Poly-β-benzyl-L-aspartate, 321
Ellison, Prof. M. A., and others: The Solar Flare of June 1, 1960, 926
Elsevier's Dictionary of Electronics and Waveguides: Swedish Supplement to (W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1059
Elsevier's Telecommunication Dictionary in Six Languages—English/American, French, Spanish, Italian, German, Dutch (compiled and arranged on an English alphabetical base by A. Visser), *review* by Dr. R. L. Smith-Rose, 1059
Elson, N.: Has joined Cossor Communications, Ltd., as technical director, 832; work of, 832
Elson and Morgan Method: Glucosamine Values of Muramic Acid and other Amino-Sugars by the (R. E. Strange), 38
Elton, C. S.: Evolutionary Divergence, *review*, 446
Elton, Dr. G. A. H., and Ewart, J. A. D.: Starch-Gel Electrophoresis of Wheat Proteins, 600
Elution (Absorption-) Grouping of Dried Blood-stains on Fabrics (S. S. Kind), 789
Embassy (British), at Buenos Aires: Appointment of A. G. Mill as agricultural and food attaché, 1075
Emberger, Prof. L. (Lemée, Prof. G., and): Problems of the Arid Zones (Plant Ecology), 295
Embryo: The Avian (Prof. Alexis L. Romanoff), *review* by Prof. C. H. Waddington, 814
Embryo (Chick): Assay of Corticosteroids in the (Sir Macfarlane Burnet and N. L. Warner), 938
Embryo (Chick) Fibroblast Cells: An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected (Dr. J. Vilček), 73
Embryonic Cuticle (Provisional), of a Lepidopteran: Occurrence and Function of the (Dr. R. K. Sharan), 1040
Embryonic Plant Tissue: Stabilization by Manganous Ions of Ribosomes from (Dr. J. W. Lyttleton), 1026
Embryos of Birds, *review* by Prof. C. H. Waddington, 814
Embryos (Guinea Pig): Development of Delayed-type Hypersensitivity in (Jonathan W. Uhr), 957
Embryos (Rat): Effect of Trypan Blue on (F. Beck, Dr. B. Spencer and Prof. J. S. Baxter), 605
Emeléus, Prof. H. J.: Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079
Emergence of Civilization: Africa's Place in the (Prof. Raymond A. Dart), *review* by M. C. Burkitt, 891
Emery, Dr. V. J.: Appointed lecturer in mathematical physics at the University of Birmingham, 465
EMI Co., Ltd.: Figure Reading Electronic Device (*Fred*), 28
Emigration Overseas: Welsh (Prof. E. G. Bowen), 843
Emission (Exo-Electron), in Plastically Deformed Metals: A Possible Origin of (Dr. A. H. Meleka and W. Barr), 232
Emission (Radio), from Jupiter: Ionospheric Modification of the (Prof. Alex G. Smith, T. D. Carr, H. Bollhagen, N. Chatterton and F. Six), 568
Emmelot, P., and Bennedetti, E. L.: Cytoplasmic Particles and their Role in Protein Synthesis (Inhibition of the Ability of whole Microsomes to Incorporate Amino-Acids in Rats injected with Dimethyl-nitrosamine), 645
Emmerson, P., and others: Chemical Effects of Ionizing Radiations on Nucleic Acids and Nucleoproteins, 319
Enamel (Tooth): Organic Matrix of (J. E. Eastoe), 411
Encephalitis (Tick-borne): Virus and Antibodies in the Lymph and Blood of Sheep infected experimentally with the Virus of (Doubravka Málková), 716
Encephalitis Virus-infected Chick Embryo Fibroblast Cells: An Interferon-like Substance released from Tick-borne (Dr. J. Vilček), 73
Encyclopedia: Man-Made Textile (edited by J. J. Press), *review* by Prof. C. S. Whewell, 2
Endocrinology of Reproduction, *review* by Prof. P. L. Krohn, 5
Endocrinology of Reproduction: Recent Progress in the—Proceedings of the Conference held in Syracuse, 1958, *review* by Prof. P. L. Krohn, 5
Enemies and Allies: Parasites as (Dr. J. Mahon), 203; (Prof. T. H. Davey), 203
Energies of Activation for Self-diffusion of Alkali Metal Ions in Analcite (Prof. R. M. Barrer and L. V. C. Rees), 768
Energy for the Atmosphere, *review* by Prof. P. A. Sheppard, 974
Energy (Dissociation), of S_2: Mass Spectrometric Investigation of the Vaporization of Sulphides and the (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Energy (High-) Bound Phosphate and Diabetes Mellitus (Dr. Yoshio Goto, Isao Ito, Akihiko Kuwano and Yukio Ujiie), 702
Energy (High-) Oxygen Ions in Carbon Dioxide Mass Spectra (R. M. S. Hall), 683
Energy (High-) Phosphate Requirement for Succinate Oxidation in Uncoupled Rat Liver Mitochondria (Dr. Giovanni Felice Azzone and Dr. Lars Ernster), 65
Energy (High-) Physics (Commission on High Energy Physics of the International Union of Pure and Applied Physics Tenth Annual International Conference on), 29
Energy Transfer (Linear): Effects of, on the Radiolysis of Water and Heavy Water (Dr. E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Engelberg, Hanna, and Artman, Dr. M.: Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin, 801
Engine (Steam) to Satellite: Science as History—the Story of Man's Technological Progress from (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J. L. Stollery, 8
Engineer: Statics and the (Sir Alfred Pugsley), 844
Engineering: Radio and Electronics, 115
  Television (S. W. Amos and D. C. Birkinshaw), Vol. 1, Fundamentals, Camera Tubes, Television Optics, Electron Optics (written in collaboration with J. L. Bliss); Vol. 2, Video-Frequency Amplification; Vol. 3, Wave-form Generation; Vol. 4, General Circuit Techniques, *review* by Dr. R. L. Smith-Rose, 358
Engineering Laboratory (National): Open Days (R. I. Lithgow), 899
  Symposium on Flow Measurement in Closed Conduits, 905
Engineering Personnel (Scientific and): Direction and Supervision of (Northampton College of Advanced Technology, London, Advanced Course on), 905
Engineering (Chemical) Practice (edited by Herbert W. Cremer and Sidney B. Watkins), Vol. 11, Works Design, etc., *review* by Prof. J. M. Coulson, 887
Engineering (Electrical), in the Imperial College of Science and Technology, London, 463
Engineering (Electronic) Association: Awards for articles on Electronics, 116
Engineering (Electronic) Society (Hull), (Institution of Electronics, with the co-operation of the): Electronics and Instruments Exhibition and Convention, 650
Engineering (Mechanical), at Cardiff, 555
Engineering (Nuclear) Abstracts, Vol. 1, No. 1, 993
Engineering (Soil): Laboratory Testing in (T. N. W. Akroyd), *review* by Dr. H. L. Penman, 891
Engineering (Television): Principles and Practice of, *review* by Dr. R. L. Smith-Rose, 358
Engineering Corporation (High Voltage): Second Accelerator Conference, 743
Engineering Education in Russia (S. P. Timoshenko), 537
Engineering Invention: History of, *review* by J. L. Stollery, 8
Engineering Problems: Unification of Analytical Approaches to, *review* by Prof. J. Greig, 359
Engineering Sciences, Royal Swedish Academy of, and the Swedish Association of Technical Physicists: Fifth International Instruments and Measurements Conference and Exhibition, 374
Engineering Systems Analyses (Prof. Robert L. Sutherland), *review* by Prof. J. Greig, 359
Engineers, Royal Institute of, and others: International Congress on the Technology of Plastics Processing, 559
Engineers (Chemical), Institution of (Constructors John Brown, Ltd., and the): A CJB Scholarship awarded to M. D. Taylor, 650
Engineers (Corrosion), British Association of: Elected a member of the European Federation of Corrosion, 25
Engineers (Gas), Institution of, and the Corrosion Group (Birmingham and Midlands Section) of the Society of Chemical Industry: Symposium on the Protection of Gas Plant and Equipment from Corrosion, 466
Engineers (Radio), British Institution of: Report on the Education and Training of Professional Radio and Electronics Engineers, 115
Engineers (Radio), Institute of (Benelux Section), in co-operation with others: International Symposium on Data Transmission, 290
Engineers (Radio), Institute of (Group on Communications Systems), and others: International Symposium on Data Transmission, 290
Engineers (Radio and Electronics): Education and Training of Professional (British Institution of Radio Engineers Report on), 115
Engineers (Women): Travel Awards for (Caroline Haslett Memorial Trust), 116
Engines (Air-breathing): High Mach Number (AGARD fourth Colloquium on Combustion and Propulsion), 18
England: Monetary Thought and Monetary Policy in (Prof. R. S. Sayers), 844
England (Rural), Council for the Preservation of: Twenty-first National Conference for the Preservation of the Countryside, 559
Englert, F. (Aigrain, Prof. P., et): Les Conducteurs, *review* by Dr. J. R. Tillman, 1058
English Blood Donors: MNSS Gene Frequencies in (Dr. T. E. Cleghorn), 701
English Catalogue: Soviet Science in, 1960 (Program for Science Translations, Jerusalem), 832
English Education: Sixty Years of Progress in (Prof. H. C. Dent), 848
English Newspaper since 1900: The (F. Atkinson), 116
English Rural Life, Museum of: Report for 1959, 26
Enkomi Silver Cup (Dr. G. F. Claringbull and A. A. Moss), 1051; (Dr. Harold J. Plenderleith), 1052
Ennor, Prof. A. H. (Rosenberg, Dr. H., and): Occurrence of Free D-Serine in the Earthworm, 617
Enough: Chemistry is Not (Dr. James Taylor), 841
Enriched (Highly) Oxygen-18 Water Solutions containing Hydrogen Peroxide-16,16: Radiolysis of (Dr. Michael Anbar, Shmuel Guttmann and Prof. Gabriel Stein), 57
Ensete berryi—Revised Name for *Musa ensetiformis* Berry (R. K. Jain), 342
Enteric Bacilli: Effect of the Peritoneal Fluid of the Guinea Pig on Strains o (Prof. R. J. Roantree and L. R. Collis), 1045
'Enthalpy Titrations' and Thermochemistry in Molten Salts (Prof. Joseph Jordan, Jurg Meier, Edward J. Billingham, jun., and James Pendergrast), 318
Entomology: Annual Review of (edited by Edward A. Steinhaus and Ray F. Smith), Vol. 5, *review* by Prof. V. B. Wigglesworth, 542
Enucleated Fragments (Nucleated and), of *Amoeba proteus*: Effect of Pyruvate upon (Dr. Edmund Guttes and Sophie Guttes), 432
Envelopes (Moving), of Stars (Prof. V. V. Sobolev), translated by Sergei Gaposchkin, *review* by Prof. W. H. McCrea, 538
Environment: Cells and their, *review* by Dr. E. N. Willmer, 450
Environment (Geological), in West-Central New Mexico: Anomalous Leads from a Selected (William F. Slawson and Carl F. Austin), 400
Environment (Human): Mode of Formation of 3,4-Benzopyrene in (Prof. G. M. Badger, R. W. L. Kimber and T. M. Spotswood), 663
Environment and Culture in Southern Rhodesia (Roger Summers), 993
Enzymatic Activation of a Hormone-like Response in *Hydra* by Proteases (Dr. Howard M. Lenhoff and John Bovaird), 671
Enzymatic Hydrolysis: Formation of 6-Aminopenicillanic Acid from Penicillin by (Dr. G. N. Rolinson, F. R. Batchelor, D. Butterworth, J. Cameron-Wood, Dr. M. Cole, G. C. Eustace, Marian V. Hart, Dr. M. Richards and Prof. E. B. Chain), 236
Enzymatic Synthesis of Formylglutamic Acid by a Plant Protein (Ernest H. Byers, Jun., and T. J. Bond), 416
Enzyme: A Genetically Determined, in the Pig (Dr. K.-B. Augustinsson and Dr. B. Olsson), 924
Enzyme (Proteolytic), from *Bacillus subtilis*: Amino-Acid Sequence about the Reactive Serine of a (Dr. F. Sanger and D. C. Shaw), 872
Enzymes: Intracellular Localization of (Centre Inter-Universitaire de Recherches Enzymologiques Colloquium on), 836

Enzymes (Respiratory-chain) : Effect of Heavy Water on (Dr. H. Laser and Prof. E. C. Slater), 1115
Enzymic De-iodination of Thyroxine : Transiodination of Proteins during (Dr. J. R. Tata), 1025
Eosinophil Leucocyte-attracting Effect of Histamine in Skin (Dr. R. K. Archer), 155
Epidemiology of Cancer of the Lung (United Nations, World Health Organization, Technical Report Series No. 192), 115
Epidermal Cell in an Insect : The Control of Growth and Form—a Study of the (Prof. V. B. Wigglesworth), *review* by Prof. R. Dennell, 631
Epidote Minerals : Stability of (Prof. W. S. Fyfe), 497
Epinephrine and Norepinephrine in Liver and Kidney : Formation of a New Metabolite of (Dr. Goldstein and Dr. S. B. Gertner), 147
Epithelium (Lens) : Comparison between the Effects of Cysteine and of Anoxia on the Rate of Mitosis in (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Epstein, Dr. M. A., and Holt, Dr. S. J. : Site and Nature of Adenovirus Nucleic Acid, 1050
Epstein, Dr. Samuel S., and Weiss, Jacqueline B. : Measuring the Size of Isolated Cells, 461
Equations for Determining Diffusion Coefficients in Liquid Systems by the Diaphragm-Cell Technique (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Equations (Differential) : Boundary Problems in—Proceedings of a Symposium conducted by the Mathematics Research Center of the United States Army at the University of Wisconsin, 1959 (edited by Prof. Rudolph E. Langer), *review* by Prof. E. T. Copson, 451
Equatorial Spread-*F* and *F*-Layer Heights (Dr. A. J. Lyon, Dr. N. J. Skinner and Prof. R. W. Wright), 1086
Equipment (Electronic), used in the Nuclear Energy Industry in France (P. Desneiges, M. Doireau, L. Koch and J. Weill), 1076
Equipment (Gas Plant and) : Protection of, from Corrosion (Institution of Gas Engineers and the Corrosion Group of the Birmingham and Midlands Section of the Society of Chemical Industry Symposium on), 466
Equipment Exhibit (Research) : Tenth Annual Instrument Symposium and (United States National Institutes of Health), 559
Equivalent Pore Radius of Kidney Slices from *Necturus* : Effect of Anti-Diuretic Hormone and Calcium on the (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Ergonomics in Industry (Department of Scientific and Industrial Research Conference on), 117
Ergun, Sabri, and others : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal, 1014
Ernster, Dr. Lars (Azzone, Dr. Giovanni Felice, and) : A High-Energy Phosphate Requirement for Succinate Oxidation in Uncoupled Rat Liver Mitochondria, 65
Error (Inborn), of Metabolism : Reversibility of an Inherited Metabolic Block (Dr. Herman Zondek, Dr. Hannah E. Leszynsky and Dr. Joseph A. Stein), 515
Ershov, A. P. : Programming Programme for the BESM Computer (translated from the Russian by M. Nadler, edited by J. P. Cleave), *review* by R. J. Ord Smith, 92
Erythrocyte Antigens : Effect of Ribonuclease on (Prof. Emanuel Hackel and Robert E. Smolker), 1036
Erythrocyte Serum (Rabbit Anti-Mouse) : Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Erythocytes of Blood Group A : Substance from (J. Koscielak and K. Zakrzewski), 516
Erythrocytes and Leucocytes of Blood of Normal and Leukaemic Subjects : Zinc Content of (E. Dennes, R. Tupper and Prof. A. Wormall), 302
Escherichia coli grown in Limited Amount of Streptomycin : Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of (Hanna Engelberg and Dr. M. Artman), 801
Escherichia coli B (H) Irradiated with Ultra-violet Light : Recovery in the Presence of Chloramphenicol of (Kenshi Suzuki and Yukiko Iwama), 347
Escherichia coli (Prestarved) : Capacity of Extracts from, to Incorporate Thymidine into Deoxyribonucleic Acid (Dr. Daniel Billen), 1044
ESP : Experimental Evidence for (Dr. S. G. Soal), 171 ; (C. E. M. Hansel), 172
Espenshade, jun., Prof. Edward P : Appointed chairman of the Division of Earth Sciences of the United States National Academy of Sciences—National Research Council, 647
Essays in Comparative Education, *review* by Brian Holmes, 635
Essen, Dr. L. : The International Co-ordination of Time Signals and Standard Frequency Transmissions, 452
Essenhigh, Dr. R. H. (Beér, J. M., and) : Control of Reaction Rate in Dust Flames, 1106
Ester (Cori's), and Phosphorylated Glucides (First International Symposium on), 117, 290
Esterase Activity during Intracellular Digestion in a Histophagous Ciliate : Increase of (Dr. Miklós Muller, József Tóth and Prof. Imre Tóro), 65
Esters (Betaine), in Brain Metabolism : Isolation and Probable Functions of (Prof. E. A. Hosein and Peter Proulx), 321
Esters (Phosphate), produced by Mammalian Skin from 2-Deoxy-D-glucose (Dr. S. A. Brooks, Dr. J. C. Lawrence and Dr. C. R. Ricketts), 1028
Estimating Late Larval and Pupal Mortality in the Wild : Radioactive Labelling of Lepidopterous Larvae—a Method of (L. M. Cook and Dr. H. B. D. Kettlewell), 301
Estuary and Offshore Waters of the Sierra Leone River : Plankton of the (V. Bainbridge), 557
Ethers (Cyclic) A New Method for the Synthesis of (L. F. Schmoyer and L. C. Case), 592
Ethionine and Plant Growth Systems (R. L. Lowther and W. G. Boll), 832
tris(Ethylenediamine), Carbon (III) Ion : Catalytic Racemization of (Dr. F. P. Dwyer and Dr. A. M. Sargeson), 1022
Ethylenediamine Tetraacetic Acid Chelates : Differential Thermal Analysis of some Transition Metal (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Ethylester (DL-Methionine-) : Damage to Liver Induced by (L. Fehér, F. V. Selmeczi, K. Szaby and Dr. T. Kemény), 421
Etkin, Prof. Bernard : Dynamics of Flight—Stability and Control, *review*, 444
Euglena gracilis : A Bleached Variant of, showing a Doubling of the Content of Deoxyribonucleic Acid (Dr. George Brawerman, Carole A. Rebman and Prof. Erwin Chargaff), 1036
Europe : Prehistoric Man in (Frank C. Hibben), *review* by Miles Burkitt, 729
Europe and North America : Sap-Transmissible Viruses associated with Diseases of Grape Vines in (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
European Association for Potato Research : Series of Triennial Conferences, 466
European Countries in Process of Development : Shortages of Scientific Personnel in, 565
European Economic Co-operation, Organization for (European Productivity Agency) : Discussion on Scientific Research into Road Safety, 116
European Economic Co-operation, Organization for (European Productivity Agency), and the Centre d'Études Nucléaires : International Information Centre for Food Irradiation, 741
European Federation of Corrosion : Election of the British Association of Corrosion Engineers as a member, 25
European Information Centre for Food Irradiation (European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires), 741
  Appointment of Pierre Lévêque as director, 741
European Productivity Agency of the Organization for European Economic Co-operation : Discussion on Scientific Research into Road Safety, 116
European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires : International Information Centre for Food Irradiation, 741
European Regional Conference on Electron Microscopy (Nederlandse Vereniging voor Electronenmicroscopie), 29
Euryhaline Diptera : Osmotic Regulation in the Larvae of some (D. W. Sutcliffe), 331
Eustace, G. C., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Évacuation et Récupération de la Chaleur des Réacteurs Nucléaires (Richard Alami et Paul Ageron), *review* by R. J. Syme, 636
Evaluation of the Second, Fourth and Sixth Harmonics in the Earth's Gravitational Potential (D. G. King-Hele), 490
Evenari, Prof. M. : Problems of the Arid Zones (Plant Physiology), 295
Evans, Dr. David S. : The Transits of Venus—a Study of Eighteenth-Century Science, *review*, 636
Evans, Prof. Estyn : The Peasant and the Past (Presidential Address to Section H (Anthropology) of the British Association for the Advancement of Science), 844
Evans, I. G. : Appointed lecturer in pure mathematics at University College, Swansea, 117
Evans, Dr. Titus (edited by Dr. Wendell G. Scott and) : Genetics, Radiobiology and Radiology Proceedings, Mid-Western Conference, *review* by Dr. Lorna J. Lilly, 97
Evans, Dr. Ulick R. : The Corrosion and Oxidation of Metals, *review* by Dr. J. M. West, 182
Evaporated Metal Films : Hydrocracking of Neopentane and Neohexane over (Dr. J. R. Anderson and B. G. Baker), 937
Evaporation (Water) : New Compounds for the Control of (A. V. Deo, N. R. Sanjana, S. B. Kulkarni, M. K. Gharpurey and A. B. Biswas), 870
Evaporation and Droplet Growth in Gaseous Media (N. A. Fuchs), translated from the Russian by J. M. Pratt ; edited by Dr. R. S. Bradley, *review* by Prof. F. H. Garner, 451
Evidence for the Identity of Natriferin, the Frog Water-Balance Principle and Arginine Vasotocin (Prof. Wilbur H. Sawyer), 1030
Evidence for Internal Organization of Nucleic Acid in T_2 Bacteriophage (Irwin J. Bendet, David A. Goldstein and Max A. Lauffer), 781
Evidence for Multiple Nature of Cellulase of *Myrothecium verrucaria* (P. Y. F. Prins-van der Meulen and G. J. Schuringa), 695
Evidence (Cytochemical), of the Origin of Lipid Bodies (so-called Golgi Bodies) from Mitochondria (H. C. Chopra), 713
Evidence (Experimental), for Extra-Sensory Perception (Dr. S. G. Soal), 171 ; (C. E. M. Hansel), 172
Evison, Dr. F. F. : Appointed superintendent of the Seismological Observatory, Wellington, New Zealand, 830 ; work of, 830
Evolution of the Concept of the Electric and Magnetic Field : Michael Faraday and the (Prof. L. Pearce Williams), 730
Evolution of Experimental Tuberculosis : Effect of *Candida albicans* on the (Dr. E. Mankiewicz and Dr. M. Livak), 250
Evolution of Modern Education, *review* by Dr. James L. Henderson, 357
Evolution of Nuclear Power Plant Design (Sir Christopher Hinton), 1064
Evolution of the Rural Land Use Pattern in Cyprus (Dr. Demetrious Christodoulou), *review* by Prof. M. J. Wise, 628
Evolution above the Species Level (Prof. Bernhard Rensch), *review* by C. S. Elton, 446
Evolutionary Divergence, *review* by C. S. Elton, 446
Evolutionary Theory after Mendel, *review* by Dr. H. Kalmus, 726
Evolutionary Theory and Christian Belief : The Conflict between (Dr. David Lack), 98
Ewart, J. A. D. (Elton, Dr. G. A. H., and) : Starch-Gel Electrophoresis of Wheat Proteins, 600
Ewer, Prof. T. K. : Appointed to the newly established chair of animal husbandry in the Veterinary School of the University of Bristol, 465, 647 ; work of, 647
Ewing, Dr. Maurice : Awarded the John Fleming Medal of the American Institute of Geonomy and Natural Resources, 905
Examination (Infra-red), of the Association of Cornea Proteins with Water (Dr. S. Bakerman and C. Mitchell), 1033
Excavation of La Grotte de Rochereil, 903
Excavations at Dzibilchaltun in Yucatan, 742
Excessively Large Doses of Oral Griseofulvin : Tumour-promoting Effect of, on Tumours induced in Mice by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Exchange (Covalent Super-), in Solid State Physics (Prof. W. S. Fyfe and Prof. J. Verhoogen), 1108
Exchanger (Cellulose Ion) : Non-specific Haemagglutinin from Cellulose and (Prof. B. Schmidt, Dr. K. Grossgebauer and D. Hartmann), 790
Excised *Bryophyllum* Leaves : Effects of Light and Darkness on the Rhythm of Output of Carbon Dioxide of (Dr. Malcolm B. Wilkins), 523

Excitability (Membrane), of Calcium-deficient Muscles : Restoration of, by Anodal Polarization (Prof. K. Koketsu and K Noda), 243
Excitation at the Crayfish Neuromuscular Junction with Decreased Membrane Conductance (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
Excited Electronic States of Lithium and Sodium Molecules (Dr. R. F. Barrow, N. Travis and C. V. Wright), 141
Excitons (Hydrogen-like) : Effect of Electric Fields on (J. W. Allen), 51
Exclusion of Inulin from Solutions of Hyaluronic Acid (Dr. A. G. Ogston and C. F. Phelps), 1024
Excretion of Catechol after Ingestion of Quinic and Shikimic Acids (Dr. A. N. Booth, D. J. Robbins, M. S. Masri and F. DeEds), 691
Excretion of Sodium : Critical Energy Barriers in the (Prof. E. J. Conway), 394
Excretion (Urinary), of *β*-Amino-isobutyric Acid after Injection of Thymidine labelled with Tritium (Dr. Georg B. Gerber, Gisela Gerber and Kurt I Altman), 956
Excretion (Urinary), of Œstrogens in Cases of Chronic Prostato-vesiculitis (Prof. Gunnar Nylander), 154
Executive : The Red (David Granick), 537
Executives : Selection of (T. H. Hawkins), 31
Exell, A. W., and Wild, H. (edited by) : Flora Zambesiaca, Vol. 1, Part 1, *review* by A. A. Bullock, 449
Exhibition : Second International Plastics, 559
Exhibition of 1851, Royal Commission for the : Studentship and Scholarship Awards for 1960, 116
Exhibition and Convention : Electronics and Instruments (Institution of Electronics, with the co-operation of the Hull Electronic Engineering Society), 650
Existential Psychiatry, *review* by Dr. Clifford Allen, 1062
Exo-Electron Emission in Plastically Deformed Metals : A Possible Origin of (Dr. A. H. Meleka and W. Barr), 232
Expanded Ilio-Sacral Joint in the Toad *Xenopus laevis* (Margaret Palmer), 797
Expanding Pulp and Board Industries in Britain : Scope for (J. J. MacGregor), 32
Expansion on Setting of Gypsum Plaster . Effect of Temperature on the (P. J. Sereda), 929
Expansion (Thermal), at Low Temperatures (Guy K. White), 927
Expedition · The Galathea, *review* by Dr. N. B. Marshall, 443
  The Indian Ocean (Dr. G. E R Deacon), 561
Experiment' : The 'GBR—a Trans-Atlantic Frequency Comparison between Caesium-controlled Oscillators (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Experiment in Psychology—a Centenary and an Outlook (Prof. R. C. Oldfield), 846
Experiment (Animal) : Achievement—some Contributions of, to the Conquest of Disease (Dr. Geoffrey Lapage), *review* by Dr. W. Lane-Petter, 977
Experiment (Skylark Rocket Sodium) : Upper-Atmosphere Wind Studies by (Dr. G. V. Groves), 1001
Experimental Biology, Society for : Symposia No. 13, Utilization of Nitrogen and its Compounds by Plants (edited by H. K. Porter), *review* by Prof. Walter Stiles, 815
Experimental Breeding of *Anopheles gambiae* Giles in Papyrus Swamps (L. K. H Goma), 1137
Experimental Evidence for Extra-Sensory Perception (Dr. S. G. Soal), 171 ; (C. E. M Hansel), 172
Experimental Fish . An Improved Feed for (D. R. Swift), 1133
Experimental Husbandry Farms (Terrington and Kirton), King's Lynn : Appointment of F. E. Shotton as director, 905
Experimental Mechanics : International Congress on, 559
Experimental Poisoning by Cadmium and other Metals : An Abnormal Serum Protein in (D. J. Lawford), 946
Experimental Tuberculosis : Effect of *Candida albicans* on the Evolution of (Dr. E. Mankiewicz and Dr M. Liivak), 250
Experiments on the Nutrition of Sows (Dr. G. A. Lodge), 115
Experiments (Animal), in Research, *review* by Dr. W. Lane-Petter, 977
Experiments (Archaeological Field) : Research Committee on, 289
Experiments (Echo Sounding), in the Barents Sea (I. D. Richardson, D. H. Cushing, F. R. Harden Jones, R. J. H. Beverley and R W. Blacker), 855
Experiments (Small) : Analysis of (P. Sprent), 437
Exploding Wire Phenomenon, *review* by Dr. B. A. Thrush, 726
Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959, conducted by Geophysics Research Directorate, Air Force Cambridge Research Center, with the co-operation of Lowell Technological Institute Research Foundation (edited by William G. Chace and Howard K. Moore), *review* by Dr. B. A. Thrush, 726
Exploration of the Solar System (Felix Godwin), *review* by D. G. King-Hele, 811
Exploration (Petroleum), in Britain by the British Petroleum Company during the Years 1945-57 : Geological Results of (N. L. Falcon and P. E. Kent), 1078
Exploring Vector Space, *review* by Dr. J. W. Jeffery, 975
Explosives (High) : The Science of (Prof. Melvin A. Cook), *review* by Dr. W. L. Murray, 539
  Theory of, *review* by Dr W. L Murray, 539
Exposure to Intense Radiation : Biological Effects of, 910
Exposure (Short-Time), to Ultra-violet Irradiation : Delayed Recovery of Airborne *Serratia marcescens* after (Dr. R L. Dimmick), 251
Expression of Concentrations of Solutions (E. H. Leach), 350
Extinction (Interstellar), and Polarization (R. Wilson), 288
Extracorporeal Circulation : Influence of 5-Hydroxytryptamine on Renal Function in (Dr. M. H Frick), 609
Extraction of Metals and the Chemistry of Metals (Prof. F. D. Richardson), 466
Extracts from Prestarved *Escherichia coli* : Capacity of, to Incorporate Thymidine into Deoxyribonucleic Acid (Dr. Daniel Billen), 1044
Extra-Sensory Perception : Experimental Evidence for (Dr. S. G. Soal), 171 ; (C. E. M. Hansel), 172
Extremely Low Temperatures : Survival of Woody Plants at (Johnson Parker), 1133 ; (Dr. Akira Sakai), 1134
Eye (Lateral), of the Horseshoe Crab : Summative Action of Acetycholine with Physiological Stimulus on the Generator Potential in the (R. Kikuchi, K. Naito and S. Minagawa), 1118

F ECHOES (Spread), at Low Latitudes : Possibility of Detecting Ionospheric Drifts from the Occurrence of (R. W. Knecht), 927
F-Layer Heights : Equatorial Spread-*F* and (Dr. A. J. Lyon, Dr N. J. Skinner and Prof. R. W. Wright), 1086
Fabrication des Colles des Glutinants et Matiéres d'Apprêts : Traité Général de la (Dr. Maurice de Keghel), nouvelle édition, *review* by Prof. A G. Ward, 890
Fabrics : Absorption-Elution Grouping of Dried Blood-stains on (S. S. Kind), 789
Facilities (Nuclear Training) at the Royal Naval College, Greenwich (Prof. J. Edwards), 545
Fact and Opinion, *review* by Prof. O. L. Zangwill, 817
'Factor' from a Pregnant Rabbit for Ovarian Maturation · Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Factor (Bradykinin-releasing) from *Bothrops jararaca* Venom (Dr. Olga B. Henriques, Mina Fichman and W. T Beraldo), 414
Factor (Growth), for *Haemophilus* Species secreted by a Pseudomonad (Moshe Shifrine and Prof. Ernst L. Biberstein), 623
Factor C (The Rh), in South African Bantu (Dr. A. Zoutendyk and Dr. H. Teodorczuk), 790
Factories : Noise in (A. G. Aldersey-Williams), 1085
Factors (Particle Shape), in the Sieve Range : A Method for the Routine Measurement of (Dr. Colin C. Harris), 401 , (D. Howitt), 403
Factors (Serum) Gm^a, Gm^b, Gm^x and Gm-like : Effect of Heat on the (Prof Arthur G Steinberg and Rachael Stauffer), 791
Factors (Steric), affecting the Specificity of Polyglycosidases (F. W. Parrish and A. S. Perlin), 1110
Faith : Questions of Science and (Dr. Hawthorne), 28
1063
Faith of a Physicist (Dr. H. E. Huntley), *review* by Dr. H. D. Anthony,
Falcon, N. L., and Kent, P. E. : Geological Results of Petroleum Exploration in Britain by the British Petroleum Company during the Years 1945-57, 1078
Falconer, Dr. D. S. : Introduction to Quantitative Genetics, *review* by Prof. Kenneth Mather, 813
Fall III : The Wish to—a Study of Psychoanalysis and Medicine (Dr. Karin Stephen), *review* by Dr Clifford Allen, 978
Fall-out Caesium in Surface Sea Water off the California Coast (1959-60) by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Fall-out (Radioactive), in Ghana (Dr. A. H. Ward and J. D Marr), 299
Family : Science for the, *review* by Dr. D. R. Dickinson, 978
Family Contacts : Tuberculosis—Risk to, 1084
Family and Home . Social Development through the (Report of the Conference on), 567
Fan, C. Y. : Penetration of Charged Particles in Matter (Spectroscopic Study of Electron-capture Processes), 1086
Fano, U. : Penetration of Charged Particles in Matter (Energy-loss Distributions), 1086
Faraday (Michael), and the Evolution of the Concept of the Electric and Magnetic Field (Prof L. Pearce Williams), 730
Faraday Society : General Discussion on the Physical Chemistry of Aerosols, 201
Faraday Society (Colloid and Biophysics Committee) · Informal Discussion on Cytoplasmic Particles and their Role in Protein Synthesis, 643
  Symposium on the Physico-chemical, Biological and Applied Aspects of Autoxidation, 746
  Discussion on Ultracentrifugation of Biological Macromolecules, 905
Farkas, Dr. G. S., and others . Lipaemic Clearing Action of Artificial Anticoagulants, 782
Farrington, Prof B. : Francis Bacon without his Background, *review*, 817
Fast Transfer Reactions : Physiological Role of (Massachusetts Institute of Technology Seminar Lectures on), 904
Fat Diet : An Inverse Relation between the Liver Glycogen and the Blood Glucose in the Rat adapted to a (Dr. P. A. Mayes), 325
Fate of Homologous Adult Spleen Cells Injected into New-born Mice (A. J. S. Davies and Sheila M. A. Doak), 610
Fate of Transforming Deoxyribonucleate following fixation by Transformable Bacteria, I (Dr. Maurice S. Fox and Dr Rollin D. Hotchkiss), 1002 ; 2 (Dr. Maurice S. Fox), 1004
Fatigue Crack in Mild Steel : Correlation of the Alternating Stresses required to Initiate and Propagate a (N. E. Frost), 233
Fatty Acid Composition of the Lipids of Pasture Grasses (Dr. G. A. Garton), 511
Fatty Acids of Lower Molecular Weight : Determination of, by Gas Chromatography (Marie L. Vorbeck, Leonard R Mattick, Frank A. Lee and Carl S Pederson), 689
Fatty Acids (Conjugated) : Gas Liquid Chromatography of (Dr. N. W. R. Daniels and J. Wendy Richmond), 55
Faulkner, Dr C R . Effect of Upper Atmosphere Wind on the Rotation of Satellite $1958\delta 1$, 926
Fauna (Echinoderm), of the Central North Sea : A Quantitative Investigation of the (Dr. Erik Ursin), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr. A. J. Southward, 360
Fauna (Oligochaeta), of Three Danish Brackish Water Areas (Ingerlise Dahl), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A. J Southward, 360
Fauna (Polychaeta), of South Africa (Prof J. H. Day), Part 5, 199
Fayalite : Formation of, in Roast Reduced Jaspilite (J. B. Lean, K. J. Tucker, B. O. Holland and T. R. Thomson), 683
Feather, Prof. Norman : An Introduction to the Physics of Mass, Length and Time, *review* by G. R. Noakes, 183
Fedorov, V. D., and others : A New Species of Green Sulphur Bacteria, 167
Feed (An Improved), for Experimental Fish (D. R. Swift), 1133
Feeding Grounds (Whale), in the Antarctic : Southern Atmospheric Cyclones and the (Dr. C. W. Beklemishev), 530
Feeding-Stuffs : Nigeria's (V. A. Oyenuga), second edition, *review* by Dr. Richard Mellanby, 637
Fehér, I., and others : Damage to Liver induced by DL-Methionine-Ethyl-ester, 421
Fehér, Dr. T , and Matkovics, Dr. Béla : Chemical Constitution of the Red Blood Cell Membrane, 701

Feigen, Prof. G. A., and others Effect of Nitrate Ion on the Distribution of Sucrose in the Rat's Ventricle, 419
Feingold, Dr. David S. : Appointed assistant professor of bacteriology in the University of Pittsburgh, 905
Feldman-Muhsam, Dr. B., and Havivi, Y. : Accessory Glands of Gene's Organ in Ticks, 964
Fellowship (Armourers and Brasiers' Research) awarded to Dr. J. H. Brunton, 291
Fellowship (Foulerton Gift Research) awarded by the Royal Society to Dr. J. Seed, 291
Fellowships in Chemistry (Ramsay Memorial Fellowship Trust Awards for 1960-61), 832
Fellowships for Research in the Use of Electronic Computers (Unesco), 465
Fellowships (Travelling), in Medicine, 994
Female Mice (Resistance of Male and), to Ectromelia : Effect of a Primary Tuberculous Infection on the (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Feng, Dr. Yu Sheng Louise (Wase, Prof. Arthur W., and) : Sialoadenectomy and the Distribution of Thyrotrophin labelled with Iodine-131, 778
Fernández-Morán, Dr. H. : Freezing and Drying of Biological Materials, 749
Ferretti, A., and others : Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238
Ferri, Prof. A. : Combustion and Propulsion (High Mach Number Air-breathing Engines), 19
Ferricyanide Reduction Method for Reducing Sugars (Dr. Richard I. Mateles), 241
Ferrimagnetism in Theory and Practice, *review* by Dr. G. E. Bacon, 974
Ferrites (Dr. J. Smit and Dr. H. P. J. Wijn), *review* by Dr. G. E. Bacon, 974
Ferritin-conjugated Antibody : Use of, to Localize Antigen by Electron Microscopy (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094
Ferromagnetic and Antiferromagnetic Behaviour in the Second Transition Group (Dr. B. R. Coles and D. Griffiths), 226
Ferrous Solutions : Radiolytic Oxidation of, with Standardized Internal Sources of Phosphorus-32 (Dr. M. Pessach and J. Steyn), 58
Fertility of Mice treated with Phosphorus-32 (E. A. D. Holmberg, Dr. A. Pavlovsky, C. D. de Pasqualini and S. L. Rabasa), 876
Fertility and Population Policy : Population Growth, (Prof. D. V. Glass), 849
Fertility (Anti-) Action of a Monoamine Oxidase Inhibitor (W. G. Spector), 514
Fertilization (Self-) in the Calyptraeidae : Protandry and (Dr. H. V. Wyatt), 520
Feulgen-stained Somatic Cell Nuclei : Absorbance of (Dr. Simon Iversen), 86
Fibres : Man-made, *review* by Prof. C. S. Whewell, 2
Fibrinogen-Fibrin Transition : Some Aspects of the (K. Laki, Jules A. Gladner and J. E. Folk), 758
Fibroblast Cells (Chick Embryo) : An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected (Dr. J. Vilček), 73
Fichman, Mina, and others : Bradykinin-releasing Factor from *Bothrops jararaca* Venom, 414
Fiction (Science) : Beyond, *review* by Dr. D. J. West, 270
Field Experiments (Archaeological) : Research Committee on, 289
Field Studies Association (Scottish) : Annual Report for 1959, 200
Figure Reading Electronic Device (*Fred*), (E.M.I. Co. Ltd.), 28
Figures of Celestial Bodies : Theories of (Wenceslas S. Jardetzky), *review* by Prof. L. S. Goddard, 890
Figures (Preparing) : Oceanography of Long Island Sound—Guide for (Y. H. Olsen and James E. Morrow, Jr.), 123
Film Archive (National) : Catalogue, Part 2, Silent Non-Fiction Films (1895-1934), 199
Film Institute (British) : National Film Archive Catalogue, Part 2, Silent Non-Fiction Films (1895-1934), 199
Films of Historical Value : Preservation of, 199
Films (Evaporated Metal) : Hydrocracking of Neopentane and Neohexane over (Dr. J. R. Anderson and B. G. Baker), 937
Films (Sulphide), on Steel : Growth of (R. B. Campbell, L. Grunberg and H. M. Scott), 588
Films (Tin) : Speed of the Superconducting-Normal Transition in (D. J. Oliver, M. J. Rayner and E. H. Rhoderick), 492
Filmstrips : New (Educational Publications, Ltd., Wakefield), 832
Filon, S. P. L. : Book-buying Policy of the National Central Library, 992
Filters (Membrane) : Radioactive Labelling of, for the Assay of Air-borne Material (Dr. G. Kubie and Dr. K. Spurny), 930
Final Months and Descent of Satellite *Sputnik* 3 (B. R. May and D. E. Smith), 456
Financing of Research in Biochemistry and Allied Sciences : Organization and (Biochemical Society and the British Association for the Advancement of Science Colloquium on), 650
Finch, J. T., and others : Cytoplasmic Particles and their Role in Protein Synthesis (Pattern of Ribosomal Ribonucleic Acid in X-Ray Diffraction Photographs compared to that given by Extracted Ribonucleic Acid), 644
Finch (Weaver), *Quelea quelea* : Effects of Whole-body Irradiation on the Breeding Plumage of the (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Findlay, Dorothy, and others : Activity of Bovine Pancreatic Ribonuclease A in Mixed Solvent Systems, 601
Findlay, W. P. K. (Cartwright, K. St. G., and) : Decay of Timber and its Prevention, *review* by Prof. F. W. Jane, 977
Fine, Dr. J. M., and others : Haptoglobin Types in 398 Blood Donors from Dakar (Senegal), 517
Finland, Prof. Maxwell (edited by Dr. Henry Welch and) : Antibiotic Therapy and Staphylococcal Diseases, *review* by Prof. R. Knox, 637
Fire (Greek) and Gunpowder : A History of (Prof. J. R. Partington), *review* by Prof. R. J. Forbes, 272
Firearms : Incendiaries, Fireworks and, *review* by Prof. R. J. Forbes, 272
Fireworks and Firearms : Incendiaries, *review* by Prof. R. J. Forbes, 272
First Decade of DDT, *review* by Prof. D. S. Bertram, 271
First Statesman of Science : Francis Bacon, the (J. G. Crowther), *review* by Prof. B. Farrington, 817
Firth, Prof. Raymond : Social Change in Tikopia, *review* by Sir Harry Luke, 816
Fischer, Dr. E., and others : Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia, *erratum*, 559
Fischer, Prof. Roland (Griffin, Frances, and) : Differential Reactivity of Saliva from 'Tasters' and 'Non-Tasters' of 6-n-Propylthiouracil, 417
Fish (Experimental) : An Improved Feed for (D. R. Swift), 1333
Fish (Sound-producing) : Electrophysiological Observations on a (A. Packard), 63
Fisher, James, and Huxley, Sir Julian (editorial board : Dr. J. Bronowski, with Sir Gerald Barry,) : Science—Chemistry, Physics, Astronomy, *review* by Dr. D. R. Dickinson, 978
Fisheries Research (Oceanographic and), by the Submarine *Severyanka* (V. P. Zaitzev), 559
Fishes (Non-Cichlid), in Lake Victoria Breeding Sites of (Dr. Philip S. Corbet), 616
Fisica, Società Italiana di : International Summer Course on Solid State Physics, 201
Fission (Nuclear), in the Early History of the Earth (Prof. P. K. Kuroda), 36
Fission (Spontaneous), of Californium-252 ; Rare Modes in the (Prof. E. W. Titterton and T. A. Brinkley), 228
Fission Product and Beryllium-7 Concentrations in the Atmosphere : Comparison of (W. Anderson, R. E. Bentley, R. P. Parker, J. O. Crookall and L. K. Burton), 550
Fitch, Coy D., and Dinning, Prof. James S. : Production of Muscular Weakness in Rats by a Creatine Analogue, 421
Fitzpatrick (Percy) Institute of African Ornithology, Cape Town : Appointment of Dr. J. M. Winterbottom as director, 201
Fitzpatrick, Prof. T. B., and others : Melanin Granules and Mitochondria, 392
Fiume, Dr. L. : Inhibition of Aerobic Glycolysis in Yoshida Ascites Hepatoma by Tartronic Acid, 792
Five Co-ordinated Titanium in $K_2Ti_2O_5$ (Dr. Sten Andersson and Dr. A. D. Wadsley), 499
Fixation by Transformable Bacteria : Fate of Transforming Deoxyribonucleate following, 1 (Dr. Maurice S. Fox and Dr. Rollin D. Hotchkiss), 1002 ; 2 (Dr. Maurice S. Fox), 1004
Fixation (Acetone), for the Cytochemical Demonstration of Dehydrogenases in Blood and Bone Marrow Cells (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Fixation (Nitrogen) : Copper and Cobalt in (Prof. E. G. Hallsworth, S. B. Wilson and E. A. N. Greenwood), 79
Fixation (Osmium) : Induced Fluorescence with Acridine Orange, after (W. J. Randles), 964
Flames (Dust) : Control of Reaction Rate in (J. M. Beér and Dr. R. H. Essenhigh), 1106
Flare (The Solar), of June 1, 1960 (Prof. M. A. Ellison, Susan M. P. McKenna and J. H. Reid), 926
Flares (Chromospheric) : Measurement of Magnetic Fields in (M. Blaha, M. Kopecky and Z. Svestka), 224
Flat Rolled Products—Rolling and Treatment (edited by T. E. Dancy and E. L. Robinson), *review* by Prof. F. C. Thompson, 273
Flavonoid Pigments of *Lathyrus odoratus* (J. B. Harborne), 240
Flea (Rabbit), *Spilopsyllus cuniculi* (Dale) : Breeding of the—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Fleming (John) Medal of the American Institute of Geonomy and Natural Resources awarded to Dr. Maurice Ewing, 905
Fletcher, Prof. W. W. : Herbicides and the Soil (Effects of Herbicides on Soil Micro-organisms), 377
Flies (Dragon-), (Dr. Philip S. Corbet, Cynthia Longfield and Dr. N. W. Moore), *review* by Dr. D. E. Kimmins, 631
Flight : Dynamics of—Stability and Control (Prof. Bernard Etkin), *review*, 444
  Stability and Control of, *review*, 444
Flight by Man-Power (Dr. E. Guerra and Dr. B. Gunther), 419
Flight (Space) : Proposals for, *review* by D. G. King-Hele, 811
Flood Barrier (Thames) : Technical Possibilities of a, 294
Floodgate, Dr. G. D. : Microbial Systematics, 191
Flooding (Tidal), in London : Protection against (N. B. Webber), 293
Flora of the Zambesi Basin, *review* by A. A. Bullock, 449
Flora Zambesiaca (edited by A. W. Exell and H. Wild), Vol. 1, Part 1, *review* by A. A. Bullock, 449
Florence, T. M., and Smythe, L. E. : Use of Azo Dyestuffs for the Polarographic Determination of the Lanthanides, 771
Florensov, N. A. (Selonenko, V. P., and) : Tectonics of the Gobi Mountains, 373
Flow (Plastic) : The Physical Nature of (Dr. J. J. Gilman), 374
Flow Coefficients of Permeable Solids : Measurement of Slip (*Ko*) and Viscous (*Bo*), (J. G. Berum), 865
Flow Measurement in Closed Conduits (National Engineering Laboratory Symposium on), 905
Fluctuations (Periodic Magnetic Field), in the *Sceptre* Discharge (Dr. N. L. Allen), 279
Fluid (Bingham) : Yield Stress exerted on a Body Immersed in a (G. Boardman and Dr. R. L. Whitmore), 50
Fluid (Peritoneal), of the Guinea Pig : Effect of the, on Strains of Enteric Bacilli (Prof. R. J. Roantree and L. R. Collis), 1045
Fluids, Physics of : To be published monthly starting in 1961 (American Institute of Physics), 832
Fluids (Pump), for Higher Vacuums (Kenneth Hickman), 405
Fluorescence (Induced), with Acridine Orange, after Osmium Fixation (W. J. Randles), 964
Fluorinated Ketones : Cage Effect in the Liquid-Phase Photolysis of (R. Bowles, Dr. J. R. Majer and Prof. J. C. Robb), 314
Fluorine Compounds in Nature—the Distribution of Carbon-Fluorine Compounds in some Species of *Dichapetalum* (Sir Rudolph Peters and R. J. Hall), 573
Flux (High), of Thermal Neutrons—Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Flux (Radiation), from a Heated Tube : Effect of Specular Reflexions on the (Sir K. S. Krishnan), 135
Fly (Black-) Larvae : Bacteria as a Source of Food for (F. J. H. Fredeen), 963

Fly (Tsetse), *Glossina* : Free Amino-Acids of the (E. Bursell), 778
Fock, V. : The Theory of Space, Time and Gravitation (translated from the Russian by N. Kemmer), *review* by Dr. D W. Sciama, 4
Foetal Liver : Pattern of Haemopoiesis in the (D Brynmor Thomas, P M. Russell and Prof. J M. Yoffey), 876
Fogg, Prof G. E. : Appointed to the chair of botany in Westfield College, London, 362 ; work of, 362
Foliar Application of Nutrients and Rhizosphere Microflora of *Camellia sinensis* (Dr C S. Venkata Ram), 621
Folk, J E , and others : Some Aspects of the Fibrinogen–Fibrin Transition, 758
Follicle Remains in some British Parchments (Dr M. L Ryder), 130
Following Rapid Rates of Crystallization A New Technique for (J. H Magill), 770
Folsom, Dr. Theodore R , and others Fall-out Caesium in Surface Sea Water off the California Coast (1959-60) by Gamma-Ray Measurements, 480
Food for Black-Fly Larvae . Bacteria as a Source of (F. J. H. Fredeen), 963
Food (Artificial) : Silkworm Raising on (Toshifumi Fukuda, Mitsumasa Suto and Yoshikichi Higuchi), 669
Food Consumption (Daily), by South African University Students (Sonia E. Walker), 381
Food Habits in Britain (Scottish Group of the Nutrition Society Symposium on), 905
Food Irradiation : International Information Centre for (European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires), 741
  Appointment of Pierre Lévêque as director, 741
Food Science and Technology International Congress of, 905
Food Storage : Use of Toxic Chemicals in Agriculture and (Request from the Research Study Group for evidence), 290
Food Supplies (World) : Pastoral Systems in relation to (Dr. William Davies), 849
Food and Agriculture Organization (United Nations) : Problems of the Arid Zones (Nomadism in relation to Grazing Resources—Nomadic Pastoralism), 296
  Appointment of Dr. Marcel Autret as director of the Nutrition Division, 743
Food and Animal Production Overseas (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 1070
Forbes, Prof. R. J. : The Royal Society and the Progress of Science Abroad, 100
  Incendiaries, Fireworks and Firearms, *review*, 272
Forces (Electrostatic) : The Physics of, and their Applications (Centre National de la Recherche Scientifique International Colloquium on), 466
Forces (Mechanical) : Initiation of Chemical Reactions by (Dr. Robert Schnurmann and Ivor S. Stringer), 587
Ford Motor Co., Ltd. : Contribution of £5,000 to the 1962 Centenary Appeal Fund of the University of Southampton, 290
Foreign (British and) School Society : Grant of £75,000 towards the general expansion of the Borough Road College, Isleworth, 371
Forest (Natural) : The Dangerous Concept of the (T. R. Peace), 848
Forestry Congress : Fifth World, 29
Forest Management : The Development of Pulp and Particle Board Industries and their Effect on (Society of Foresters of Great Britain Discussion on), 32
Foresters of Great Britain, Society of : Discussion on the Development of Pulp and Particle Board Industries and their Effect on Forest Management, 32
Form : The Control of Growth and—a Study of the Epidermal Cell in an Insect (Prof. V. B. Wigglesworth), *review* by Prof R Dennell, 631
Form in an Insect : Growth and, *review* by Prof. R. Dennell, 631
Formaldehyde : Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of (Dr Thomas Alderson), 485
Formaldehyde-induced Mutagenesis : Mechanism of—the Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde (Dr Thomas Alderson), 485
Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis (Dr. G N. Rolinson, F. R. Batchelor, D Butterworth, J. Cameron-Wood, Dr M Cole, G C Eustace, Marian V. Hart, Dr. M. Richards and Prof. E B Chain), 236
Formation of Antarctic Snows : Isotopic Composition and Temperature of (Prof. E. Picciotto, X. de Maere and Dr. I. Friedman), 857
Formation of 3,4-Benzopyrene in Human Environment : Mode of (Prof. G. M. Badger, R. W L. Kimber and T. M. Spotswood), 663
Formation of Fayalite in Roast Reduced Jaspilite (J. B. Lean, K. J. Tucker, B O Holland and T R Thomson), 683
Formation of a New Metabolite of Epinephrine and Norepinephrine in Liver and Kidney (Dr. M Goldstein and Dr. S B Gerner), 147
Formation of D-Penicillamine–Cysteine Mixed Disulphide by Reaction of D-Benzylpenicilloic Acid with Cystine (Dr. Bernard B. Levine), 940
Formation (Photochemical), and Stability of the CF_2 Radical (Dr. J. P. Simons and A. J. Yarwood), 316
Formation (Tumour) : Polyoma Virus Mutant with a Reduction in (Dr. Leo Sachs and Dan Medina), 715
Formylglutamic Acid : Enzymatic Synthesis of, by a Plant Protein (Ernest H. Byers, jun., and T J Bond), 416
Fortes, Prof. Meyer : Oedipus and Job in West African Religion, *review* by Michael Argyle, 96
Fossil Meteorites (B. I Vronsky), 648
Fossiles (Madréporaires) . Contribution à la Systématique des (James Alloiteau), *review* by Dr. H. Dighton Thomas, 95
Fossils (Prof H H. Swinnerton), *review* by Prof S Simpson, 271
Fossils for the Naturalist, *review* by Prof. S Simpson, 271
Foster, K. : Appointed lecturer in mechanical engineering at the University of Birmingham, 465
Foster, Dr. W. N. M : Awarded a Research Training Scholarship by the Animal Health Trust, 904
Foulerton Gift Research Fellowship awarded by the Royal Society to Dr. J Seed, 291
Foundation of Plant Geography, 904
Fourfold Helical Fracture in Titanium Oxide : A Symmetrical (J. S. Jackson), 1104
Fowl (Domestic) : Antibody Responses of the, to Two Soluble Bacterial Antigens (Dr. G. Gowland), 624
Fowler, Dr. P. H : Appointed to a Research Fellowship in physics at the University of Bristol, 465
Fox, Dr. L. : The British Computer Society—Harrogate Meeting, 655
Fox, Dr. Maurice S . Fate of Transforming Deoxyribonucleate following Fixation by Transformable Bacteria (2), 1004
Fox, Dr. Maurice S , and Hotchkiss, Dr. Rollin D Fate of Transforming Deoxyribonucleate following Fixation by Transformable Bacteria (1), 1002
Fractionation of Nuclear Weapon Debris (Prof. C Sharp Cook, R L. Mather, R F Johnson and F. M. Tomnovec), 1100
Fractions (Mitochondrial Membrane): Sodium and Potassium in (Dr Frank Ulrich), 949
Fracture in Titanium Oxide . A Symmetrical Fourfold Helical (J S Jackson), 1104
Fracture (Chain), during the Cross-linking of Rubber : Analysis of Solubility Data to estimate Small Amounts of (L. Mullins and D T. Turner), 145
Fragments (Nucleated and Enucleated), of *Amoeba proteus* : Effect of Pyruvate upon (Dr Edmund Guttes and Sophie Guttes), 432
Frameworks (Statically Indeterminate) . A Historical Note on the Reciprocal Theorem and Theory of (T. M. Charlton), 231
France : Electronic Equipment used in the Nuclear Energy Industry in (P. Desneiges, M. Doireau, L. Koch and J. Weill), 1075
Franceschini, J , and others : Antileukaemic Activity of Glycyrrhetinic Acid, 607
Francis, C. J. : Promoted to Deputy Chief Scientific Officer in the Ministry of Aviation and appointed counsellor (Defence Research and Supply) to the United Kingdom High Commission, Canada, 646 ; work of, 646
Francis, Dr. G H : *Obituary* by Dr A. J Charig, 284
Francois, Dr. P. E. (Doniach, Dr. I., and) . Comparison of Iodine-124 and Iodine-131 in Inhibition of Goitrogenesis in the Rat, 704
Frankel, Dr T. H : The Development of Pulp and Particle Board Industries and their Effect on Forest Management, 32
Franklin, Prof. Kenneth J. : *Obituary* of Prof John F Fulton, 110
Fraser, Dr. M. J : Optimal Protein Synthesis by Ascites Tumour Cells *in vitro*, 1114
Fraser, Prof. T. Russell, and others : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thiourea or Thiouracils, 691 ; *erratum*, 1079
Frasson, E , and others : Structure of $AgSCN.P(n\text{-}C_3H_7)_3$, 772
Frazer, Prof A. C., and others : Effect of Wheat Gluten on the Peristaltic Reflex, 516
Fredeen, F. J. H. . Bacteria as a Source of Food for Black-Fly Larvae, 963
Free Amino-Acids of the Tsetse Fly (*Glossina*), (E Bursell), 778
Free D-Serine in the Earthworm : Occurrence of (Dr H. Rosenberg and Prof. A H Ennor), 617
Freeze-drying of Plant Viruses (M. Hollings and R A. Lelliot), 1078
Freezing and Drying of Biological Materials (Dr. Harold T. Meryman, and 12 others Authors), 748
Freifelder, Dr. David, and Uretz, Prof. Robert B : Dye-sensitized Photoreactivation of X-Ray Damage in Diploid Yeast, 953
French Science News : No. 1, January–March 1960, Special article on Medical Research in the Paris Hospitals, 26
Frequencies (MNSs Gene), in English Blood Donors (Dr. T. E. Cleghorn), 701
Frequency of Quadrivalents in Autotetraploid Plants (Dr. J. W. Morrison and Dr. T Rajhathy), 528
Frequency Comparison between Caesium-controlled Oscillators The 'GBR Experiment'—a Trans-Atlantic (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Frequency Advisory Committee, General Post Office : Appointment of Dr. R. L. Smith-Rose as chairman, 466
Frequency Control (Radio), in Space Telecommunications (Edward Wenk, jun.), 373
Frequency Shifts : Infra-Red (R. S Norrish), 142
Frequency Standards (Atomic Beam) . A Comparison of (R. E. Beehler, R C Mockler and C. S. Snider), 681
Frequency Transmissions : The International Co-ordination of Time Signals and Standard (Dr L. Essen), 452
Frequency (Very Low-) Hiss observed at Byrd Station, Antarctica : Association between Aurora and (Dr. L H. Martin, Dr R A. Helliwell and K. R. Marks), 751
Fresh-Water Biology (Henry Baldwin Ward and George Chandler Whipple), second edition, edited by Prof. W T. Edmonson, *review* by Dr. T. T Macan, 6
Fresh-Water Biology : North American, *review* by Dr T. T. Macan, 6
Frick, Dr. M H. : Influence of 5-Hydroxytryptamine on Renal Function in Extracorporeal Circulation, 609
Frieden, Edward H. Analyses of Relaxin, 200
Friedlander, Dr. P H. (Sayre, Dr. D , and) : Crystal Structure of 9 10-Dimethyl-1·2-benzanthracene, 139
Friedman, Dr. I., and others : Isotopic Composition and Temperature of Formation of Antarctic Snows, 857
  Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks, 1089
Friend, Dr. J : Physico-chemical, Biological and Applied Aspects of Autoxidation (Some Aspects of the Biologically Catalysed Aerobic Oxidation of Carotenoids), 747
Friend, Dr. J. A. : Given an Award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 291
Fries, Prof. Nils : Nonanal as a Growth Factor for Wood-rotting Fungi, 166
Frisch, Prof O. R. : Are the Laws of Nature Symmetrical ?, 638
Frisch, Prof. O. R. (consulting editor) : The Nuclear Handbook, *review* by K. E. B. Jay, 273
Frisco, L. F. (edited by R. A. Sodermann and) : Digest of Literature on Dielectrics, Vol 22, 1958 (United States National Academy of Sciences—National Research Council, Publication No. 713), *review* by S Weintroub, 728
Frog (Common), *Rana temporaria* : Cyclical Changes in the Distribution of the Testis Lipids in the (Dr. B. Lofts and C. Boswell), 708
Frog Water-Balance Principle and Arginine Vasotocin : Evidence for the Identity of Natriferin, the (Prof Wilbur H Sawyer), 1030
Frontiers (New), in Optics and Spectroscopy (Pittsburgh Conference and the Optical Society of America Symposium on), 289

Frost, N. E.: Correlation of the Alternating Stresses required to Initiate and Propagate a Fatigue Crack in Mild Steel, 233
Frost-point Temperature and Wind: Airborne Measurements of Latitudinal Variation of (N. C. Helliwell), 993
Fructose-1,6-diphosphatase: Alkaline C-1—Evidence for its Participation in Photosynthesis (Dr. Robert Smillie), 1024
Fruit: Biological Function of (Dr. I. Gindel), 42
Fruit Breeding and Genetics to 1955: Abstract Bibliography of—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Fruit Juice (Passion): An Acid-tolerant and Non-sporulating Yeast from (B. A. S. Rao and J. S. Pruthi), 342
Fruit Production of the Strawberry: Effect of Autumn Applications of Potassium Gibberellate on (Prof. Carter R. Smith), 620
Fruit-spot (Banana) ('Speckle') caused by *Deightoniella torulosa* (Syd.) Ell. (Dr. D. S. Meredith), 961
Fuchs, N. A. Evaporation and Droplet Growth in Gaseous Media (translated from the Russian by J. M. Pratt; edited by Dr. R. S. Bradley), *review* by Prof. F. H. Garner, 451
β-D-Fucosidase Activity of Mammalian Tissues and its relation to other Glycosidases (Dr. G. A. Levvy), 1027
Fuel and Power: Advisory Council for Research and Development in, 286
Fuel Cell: Low-Temperature (Shell Research Centre), 994
Fujita, Dr. Kazuo (Hashimoto, Dr. Hatsujiro, and): Electron Microscope Images of Dislocations, 51
Fujita, Toshio, and others: Plant-Growth Activity of α-Alkylphenylacetic Acids and 1,2-Benzo-1-cycloalkene-3-carboxylic Acids, 694
Fukuda, Toshifumi, and others: Silkworm Raising on Artificial Food, 669
Fukuhara, H. (Nisman, B., and): Cytoplasmic Particles and their Role in Protein Synthesis (Mechanism of Protein Synthesis in Micro-organisms), 645
Fulton, Dr. J. D.: Treatment of *Leishmania donovani* Infections with Surface-active Agents, 1129
Fulton, Prof. John F.: *Obituary* by Prof. Kenneth J. Franklin, 110
Function: Biological Structure and (International Union of Biochemistry and the International Union of Biological Sciences Symposium on), 905
Function of the Corpus Allatum in 'Dauer-pupa' of the Silkworm, *Bombyx mori* (Dr. Masatoshi Kobayashi), 346
Function of Deoxyribonucleic Acid: Structure, Synthesis and (Société de Chimie Physique Meeting on), 1079
Function of the Provisional Embryonic Cuticle of a Lepidopteran: Occurrence and (Dr. R. K. Sharan), 1040
Function (Antigonadotropic), of the Pineal Gland and the Oxytocin of the Neurosecretory Hypothalamic System (Prof. S.-M. Milcou and S. Pavel), 950
Function (Biological), of Fruit (Dr. I. Gindel), 42
Function (Renal), in Extracorporeal Circulation: Influence of 5-Hydroxytryptamine in (Dr. M. H. Frick), 609
Functions: Confluent Hypergeometric (Dr. L. J. Slater), *review* by Prof. W. N. Bailey, 93
Functions (Probable), of Betaine Esters in Brain Metabolism: Isolation and (Prof. E. A. Hosein and Peter Proulx), 321
Fungi (Obligately Parasitic and Saprophytic): Incorporation of Acetate into Protein by (Dr. Richard C. Staples and Dr. H. P. Burchfield), 1040
Fungi (Wood-rotting): Nonanal as a Growth Factor for (Prof. Nils Fries), 166
Fungitoxicity of Metal Ions (Dr. E. Somers), 427
Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin: An Ortho Effect influencing (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Furnaces: High-Temperature (A. Gallenkamp and Co., Ltd., Catalogue No. 620), 1077
Further Education: Part-Time Courses in (J. Heywood), 189
Fusion of Terrestrial Rocks: Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Fusion Electrolysis of Titanium (Dr. W. J. Kroll), 994
Future of British Agriculture, *review* by Sir John Russell, 721
Future of Broadcasting in Great Britain, 1076
Future of Man (Prof. P. B. Medawar), *review* by Dr. J. D. Nisbet, 446
Fyfe, Prof. W. S.: Stability of Epidote Minerals, 497
Fyfe, Prof. W. S., and Verhoogen, Prof. J.: Covalent Super-Exchange in Solid State Physics, 1108

GAGEA *reticulata* Schultes: Effect of Variations in Temperature on Meiosis in (Dr. C. P. Malik), 805
Galactic Gravitational Potential: Gravitational Red Shift of Hydrogen 21-cm. Radiation as a Method to measure (L. F. Landovitz and L. Marshall), 223
Galactic Magnetic Field: A New Limit to the, set by Measurements of the Zeeman Splitting of the Hydrogen Line (Dr. R. D. Davies, C. H. Slater, W. L. H. Shuter and P. A. T. Wild), 1088
Galathea Report—Scientific Results of the Danish Deep-Sea Expedition round the World, 1950-52 (edited by Dr. Anton Bruun, Capt. Sv. Greve and Prof. R. Spärck), *review* by Dr. N. B. Marshall, 443
Gall Disease of Cocoa. Transmission of a (A. L. Wharton and A. A. Brunt), 80
Gallagher, Dr. C. H.: Ageing of Mitochondria, 162
Gallagher, Dr. C. H., and Rees, Dr. K. R.: Levels of Pyridine Nucleotides in Liver Poisoning, 148
Gallenkamp and Co., Ltd., A.: Catalogue No. 620, High-Temperature Furnaces, 1077
Gallium Arsenide as a Semi-insulator (J. W. Allen), 403
Gallium Arsenide for γ-Ray Spectroscopy (W. R. Harding, C. Hilsum, M. E. Moncaster, D. C. Northrop and Dr. O. Simpson), 405
Gamarekian, S. Edward: Appointed Editor of *Discovery*, 741; work of, 741
Game Control. Translocation of Wild Animals as a Means of (Dr. A. M. Harthoorn, J. A. Lock and J. MacKinnon), 518
Games (Optimal): Theory of (Prof. Alan S. C. Ross), 968
γ-Aminobutyric Acid-Level in the Brain: Effect of Potassium Cyanide Poisoning on the (Dr. T. Tursky), 322
γ-Chain Haemoglobin (Haemoglobin 'Bart's'): Sedimentation Characteristics of the (Dr. R. A. Kekwick and Dr. H. Lehmann), 158
γ-Globulin (Human): Cleavage of (Dr. Rose Augustin and Barbara J. Hayward), 129
Presence of Immunologically Active Fragments after Proteolytic Degradation of (L. A. Hanson and B. G. Johansson), 599
γ-Irradiation of Lead Silicate Glass (R. S. Barker, D. A. Richardson, E. A. G. McConkey and R. Rimmer), 135
γ-Radiation Sources: Use of, for the Sterilization of Pharmaceutical Products (Report of the Association of the British Pharmaceutical Industry), 903
γ-Ray Measurements: Fall-out Caesium in Surface Sea Water off the California Coast (1959-60) by (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
γ-Ray Spectrometry. Non-destructive Analysis of Selenium by Neutron Activation followed by (Dr. Minoru Okada), 594
γ-Ray Spectroscopy: Gallium Arsenide for (W. R. Harding, C. Hilsum, M. E. Moncaster, D. C. Northrop and Dr. O. Simpson), 405
Gap between Science and Christianity: Bridging the, *review* by R. Brightman, 818
Gardens Bulletin: Vol. 17, Part 2, Special issue to commemorate the hundredth anniversary of the founding of the Singapore Botanic Gardens, 1000
Gardens (Home) Australian Native Plants for (A. E. Brooks), *review* by Dr. R. Melville, 637
Garlick, Prof. G. F. J.: A Source-Book of Semiconductor Physics, *review*, 865
Garner, Prof. F. H.: Evaporation and Droplet Growth in Gaseous Media, *review*, 451
Garnham, Prof. P. C. C.: *Obituary* of Prof. Eduard Reichenow, 554
Garrett, P. A.: Nomenclature of the Keuper Series, 868
Garth Area: The Geography of the—the Central Highlands in Miniature (Dr. Joy Tivy), 200
Gartmann, Heinz: Science as History—the Story of Man's Technological Progress from Steam Engine to Satellite (translated from the German by Alan G. Readett), *review* by J. L. Stollery, 8
Garton, Dr. G. A.: Lipid Research at the Rowett Institute (1951-59), 115
Fatty Acid Composition of the Lipids of Pasture Grasses, 511
Gas Chromatography: Determination of Fatty Acids of Lower Molecular Weight by (Marie L. Vorbeck, Leonard R. Mattick, Frank A. Lee and Carl S. Pederson), 689
Microanalytical Separation of Steroids by (C. C. Sweeley and Dr. E. C. Horning), 144
Gas Chromatography Research Center: A New (Barber-Colman Company, Houston), 289
Gas Council: Retirement of Dr. R. H. Griffith as director of research, 992
Gas Engineers, Institution of, and the Corrosion Group (Birmingham and Midlands Section) of the Society of Chemical Industry: Symposium on the Protection of Gas Plant and Equipment from Corrosion, 466
Gas Industries (Coal, Electricity and): Capital Investment in the (Ministry of Power), 1055
Gas Phase: Recombination of Oxygen Atoms in the (P. G. Dickens, R. D. Gould, Prof. J. W. Linnett and A. Richmond), 686
Gas Plant and Equipment: Protection of, from Corrosion (Institution of Gas Engineers and the Corrosion Group of the Birmingham and Midlands Section of the Society of Chemical Industry Symposium on), 466
Gas Production of Sensitive and Resistant *L*1210 Mouse Leukaemia Cells: Effect of 6-Mercaptopurine on the Net *in vitro* (Dr. H. J. Woodliff), 156
Gas-Liquid Chromatography of Conjugated Fatty Acids (Dr. N. W. R. Daniels and J. Wendy Richmond), 55
Gas-Liquid Chromatography Analyses of C_6-C_8 Hydrocarbons: Two Highly Selective Solvents for (Dr. A. van der Wiel), 142
Gas-Solid Chromatographic Separation of Hydrocarbons of High Molecular Weight (C. G. Scott and D. A. Rowell), 143
Gascoigne, Dr. J. A. (Brown, Dr. A. M., and): Biosynthesis of Cellulose by *Acetobacter acetigenum*, 1010
Gaseous Media: Evaporation and Droplet Growth in (N. A. Fuchs), translated from the Russian by J. M. Pratt; edited by Dr. R. S. Bradley, *review* by Prof. F. H. Garner, 451
Gaseous Plasmas: Diamagnetic Moment of, measured by Spin Resonance Techniques (T. C. Marshall, R. A. Kawcyn and Prof. L. Goldstein), 584
Gases (*n*-Alkyl Chloride): Ionization and Attachment Coefficients in (J. C. Devins and O. H. LeBlanc, jun.), 409
Gases (Permanent): An Ionization Detector for (Dr. J. E. Lovelock), 49
Gastro-Intestinal Mucosa: Action of some Surface-active Compounds on the (Dr. J. A. Nissim), 305
Gastropoda (Marine): 'Water Rigour' as an Aid when Operating on (Prof. B. J. Krijgsman and A. C. Brown), 69
Gastropods: Australian Bivalve (Robert Burn), 44
Gatenby, Prof. J. Bronte: International Cytology, *review*, 632
Obituary by Prof. J. N. R. Grainger, 990
Gates (Dr. Ruggles), and the Aboriginal Australian (Prof. A. A. Abbie), 375
Gautheret, Prof. R. J.: La Culture des Tissus Végétaux, *review* by A. Allsopp, 976
Gavosto, Dr. Felice, and others: Proliferative Capacity of Acute Leukaemia Cells, 611
'GBR Experiment': The—a Trans-Atlantic Frequency Comparison between Caesium-controlled Oscillators (H. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Gebbie, Dr. H. A., and others: Pure Rotational Absorption of Ozone in the Region 125-500 Microns, 765
Geddes, Dr. I. C.: Appointed to a senior lectureship in anaesthesia in the University of Liverpool, 117
Gee, Prof. G.: Awarded the Swinburne Medal of the Plastics Institute, 740
Gel (Starch-) Electrophoresis of Wheat Proteins (Dr. G. A. H. Elton and J. A. D. Ewart), 600
Gelatine and Glue Research Association (British): Nineteenth Meeting of the Research Panel, 998
Gemzell, Carl-Axel, and others: Immunoelectrophoretic Studies on Purified Human Growth Hormone, 64
MNSs Gene Frequencies in English Blood Donors (Dr. T. E. Cleghorn), 701
Gene's Organ in Ticks: Accessory Glands of (Dr. B. Feldman-Muhsam and Y. Havivi), 964

General Circuit Theory (Prof. Gordon Newstead), *review* by Prof A. H. M Arnold, 811
General Microbiology, Society of : Formation of a Microbial Systematics Group, 190
General Post Office : Appointment of Dr R L. Smith-Rose as chairman of the Frequency Advisory Committee, 466
General and Linear Circuit Theory, *review* by Prof. A H. M Arnold, 811
Generation of Aerosols by Vapour-Phase Polymerization of Methyl Acrylate (R. Pearson and G. Langer), 235
Generator Potential in the Lateral Eye of the Horseshoe Crab : Summative Action of Acetylcholine with Physiological Stimulus on the (R. Kikuchi, K. Naito and S. Minagawa), 1118
Genesis of Tektites, and Petrogenesis . Average Composition of Granites, the (Prof E H Timothy Whitten), 867
Genetic Recombination in *Salmonella typhimurium* occurring during Transmission of Colicinogeny (Dr Ozeki and Dr. Howarth), 649
Genetically Determined Enzyme in the Pig (Dr K-B Augustinsson and Dr. B Olsson), 924
Genetico-Statistical Study (A Clinical and), of Schizophrenia and Low-Grade Mental Deficiency in a Large Swedish Rural Population (Bertil Hallgren and Torsten Sjogren), 298
Genetics . Abstract Bibliography of Fruit Breeding and, to 1955—*Rubus* and *Ribes*, a Survey (Dr R. L. Knight and Elizabeth Keep), *review* by Dr. G Haskell, 184
  An Introduction to (Dr. C. M. M. Begg), *review* by Wilma George, 357
Genetics for Beginners, *review* by Wilma George, 357
Genetics of Continuous Variation, *review* by Prof Kenneth Mather, 813
Genetics (Cell Culture), of Man : Cytology and (Symposium published by the *American Journal of Human Genetics*), 116
Genetics (Human), American Journal of Symposium on Cytology and Cell Culture Genetics of Man, 116
Genetics (Quantitative) . Introduction to (Dr. D. S Falconer), *review* by Prof. Kenneth Mather, 813
Genetics, Radiobiology and Radiology Proceedings, Mid-Western Conference (edited by Dr Wendell G. Scott and Dr. Titus Evans), *review* by Dr. Lorna J. Lilly, 97
Genetics and Twentieth Century Darwinism (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 24), *review* by Dr H. Kalmus, 726
Geochemistry of Rare and Dispersed Chemical Elements in Soils (A P. Vinogradov), second edition (translated from the Russian), *review* by A H. Debnam, 629
Geoelectric Effect in Coleoptiles : Electrostatic Measurement of the (Carl Hellmuth Hertz), 320
Geographical Society (Royal) : Research Series No. 3, The Making of the Broads (Dr. J. M. Lambert, J. N Jennings, C T. Smith, Charles Green and J N. Hutchinson), *review* by Miles Burkitt, 636
Géographie des Plantes (Alexander von Humboldt et A. Bonpland), facsimile edition (Society for the Bibliography of Natural History), 904
Geography of the Garth Area—the Central Highlands in Miniature (Dr. Joy Tivy), 200
Geography (Plant) : Foundation of, 904
Geological Environment in West-Central New Mexico : Anomalous Leads from a Selected (William F. Slawson and Carl F Austin), 400
Geological Research in the Northern Highlands of Scotland, 831
Geological Results of Petroleum Exploration in Britain by the British Petroleum Company during the Years 1945-57 (N. L. Falcon and P. E. Kent), 1078
Geological Society : Memoir No. 2, Geological Results of Petroleum Exploration in Britain by the British Petroleum Company during the Years 1945-57 (N. L Falcon and P. E Kent), 1078
Geological Time-Scale : A Revised (Prof. Arthur Holmes), 27
Geology : Submarine, *review* by Dr. G E. R Deacon, 629
Geology (Regional) : Handbook of—Scotland, the Northern Highlands (Dr. J. Phemister), third edition, 831
Geology (Structural) : The Use of Stereographic Projection in (Dr. F. C. Phillips), second edition, *review* by John Sutton, 729
Geomagnetic Noise at 230 kc./s (R. L. Dowden), 677
Geomagnetic Storms and the Space around the Earth (Prof. Sydney Chapman), 824
Geometry : Molecular, *review* by Dr. J. W. Cook, 812
  A New Plasma Confinement (James L. Tuck), 863
Geonomy and Natural Resources, American Institute of : John Fleming Medal awarded to Dr. Maurice Ewing, 905
Geophysical Co-operation (International), 1959 : Recent Scientific Activities at Halley Bay— (M. J. Blackwell), 982
Geophysical Year (International) . I.G Y., Year of Discovery—the Story of the (Prof Sydney Chapman), *review* by Prof S K. Runcorn, 185
Geophysical Year (International) Observations : Distribution of Atmospheric Ozone—a Preliminary Analysis of some (J. MacDowall), 382
Geophysics : Advances in (edited by H. E Landsberg and Prof. J. van Mieghem), Vols. 4 and 5, *review* by Dr S H Hall, 1060
George, Dr. E. P , and others : Lipaemic Clearing Action of Artificial Anticoagulants, 782
George, Wilma : Genetics for Beginners, *review*, 357
Gerber, Gisela, and others : Urinary Excretion of β-Amino-isobutyric Acid after Injection of Thymidine labelled with Tritium, 956
Gerber, Dr. Georg B , and others : Urinary Excretion of β-Amino-isobutyric Acid after Injection of Thymidine labelled with Tritium, 956
Gerber, Dr. J. H : Appointed director of the Center for Aging Research of the National Institutes of Health, United States Department of Health, Education and Welfare, 374
Gergely, Dr J., and others : Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152
Germination (Pollen), in some Gramineae— *Pennisetum typhoideum* (Dr. I. K. Vasil), 1134
Germination Inhibitor of the Seed of Rice . Viability and (Prof. S. M. Sircar and Manjula Biswas), 620
Gero, Dr. S., and others : Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152
Gertner, Dr. S. B. (Goldstein, Dr. M., and) : Formation of a New Metabolite of Epinephrine and Norepinephrine in Liver and Kidney, 147
Geschwind, Dr. Irving I. : Viscosity of Concentrated Urea–Lithium Bromide Solutions, 324
Ghana : Radioactive Fall-out in (Dr. A. H. Ward and J. D. Marr), 299
Gharpurey, M. K., and others : New Compounds for the Control of Water Evaporation, 870
Gherzi, Father E. : Atmospherics on 20 kc./s. at the Time of Local Aurorae, 225
Giant Amoeba *Chaos chaos* : Streaming in Cytoplasm dissociated from the (Prof. R. D. Allen, J W. Cooledge and P. J. Hall), 896
Gibberellate (Potassium) : Effect of Autumn Applications of, on Fruit Production of the Strawberry (Prof Carter R. Smith), 620
Gibberellin Toxicity of, to Seedless and Seeded Varieties of *Vitis vinifera* (Dr. Robert J Weaver), 1135
Gibbons, Dr D F : Appointed lecturer in physical metallurgy at the University of Birmingham, 117
Gibbs, P. E : Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Botany), 742
Gibson, Dr. Alan F , and others (edited by) : Progress in Semiconductors, Vol. 4, *review* by Dr J R. Tillman, 185
Giddings, J. Calvin : "Eddy" Diffusion in Chromatography, 1023
Gilchrist, A O : Elected to a Junior Research Fellowship (Sydney Harvey Fellowship) of Churchill College, Cambridge, 742
Gill, S. : At the second Annual Conference of the British Computer Society (Advances in the United States), 656
Gillespie, Dr. R. J., and others : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy, 662
Gillet, C. M. . Delayed 'Primary' Effects in *Chara vulgaris* L subjected to X-Rays, 874
Gillett, J D . Report for 1958-59 of the East African Virus Research Institute, 565
Gillie, A. C : Transistors, *review* by Dr. J. R. Tillman, 1058
Gilman, Dr. J. J : The Physical Nature of Plastic Flow, 374
Gilmour, A E , and others : Ocean Currents in McMurdo Sound, 867
Gilmour, J. S L. : Microbial Systematics, 191
Gilson, H. C. : East African Fisheries Research Organization, 469
Gindel, Dr I Biological Function of Fruit, 42
Giolitti, G , and others . An Antibiotic Complex derived from a *Streptomyces* and Active against Gram-positive Bacteria, 1029
Gladish, Y. C., and others New Inhibitor of Monoamine Oxidase, 941
Gladner, Jules A., and others : Some Aspects of the Fibrinogen–Fibrin Transition, 758
Gland (Pineal) Antigonadotropic Function of the, and the Oxytocin of the Neurosecretory Hypothalamic System (Prof. S -M. Milcou and S Pavel), 950
Glands (Accessory), of Gene's Organ in Ticks (Dr. B. Feldman-Muhsam and Y. Havivi), 964
Glands (Adrenal), of Litter-mate Cats Proportion of Noradrenaline to Adrenaline in the (Dr. K. R. Butterworth and Dr. Monica Mann), 785
Glass, Prof D V Population Growth, Fertility and Population Policy (Presidential Address to Section N (Sociology) of the British Association for the Advancement of Science), 849
Glass (Lead Silicate) Gamma Irradiation of (R. S Barker, D A. Richardson, E. A. G McConkey and R. Rimmer), 135
Glass Rods . Strengths of Acid-etched (B. A. Proctor), 492
Glasses formed by Fusion of Terrestrial Rocks : Comparison of the Chemical Composition and Magnetic Properties of Tektites and (Dr Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Glasshouse Crops Research Institute : Open Day (F W. Toovey), 204
  Appointment of Sir William Slater as chairman of the governing body, 1079
Glasziou, K. T : The David North Plant Research Centre, 745
Gledhill, Dr. A W., and Rees, Dr. R. J. W. : Effect of a Primary Tuberculous Infection on the Resistance of Male and Female Mice to Ectromelia, 703
Glees, Dr. P. : Effect of Cortisone on Degenerating Nerve Fibres in Birds, 327
Glendinning, D R Selfing of Self-Incompatible Cocoa, 170
Glenner, Dr. George G. (Kellogg, Dr. Donald A., and) : Histochemical Localization of Human, Term Placental 17β-Œstradiol Dehydrogenases—Implications for the Transhydrogenase Reaction, 763
γ-Globulin (Human) Cleavage of (Dr. Rosa Augustin and Barbara J. Hayward), 129
  Presence of Immunologically Active Fragments after Proteolytic Degradation of (L. A. Hanson and B G Johansson), 599
β-Globulin Polymorphism in Chimpanzees (Prof. Samuel H. Boyer and Dr. William J. Young), 1035
Glomerulus (Rat), and Nephritogenic Streptococci : Immunological Relationships between the (A S Markowitz, S Howard Armstrong, jun , and Daniel S. Kushner), 1095
Glossina (Tsetse Fly) : Free Amino-Acids of the (E Bursell), 778
Glossina palpalis (R-D) in Nigeria : Use of Dieldrin in the Control of (J. B. Davies), 84
Glover, Dr J (Packter, N M , and) : Ubiquinone (50) and Ubichromenol in *Aspergillus fumigatus*, Fresenius, 413
Glover, Dr. R. E : Tuberculosis in Animals, 996
Gloyne, Dr R. W. : Weather Problems in Agriculture (Windbreaks—some Physical Effects), 996
Glucides (Phosphorylated) : Cori's Ester and (First International Symposium on), 117, 290
Glucosamine Values of Muramic Acid and other Amino-Sugars by the Elson and Morgan Method (R. E. Strange), 38
Glucose into the Lateral Ventricle of the Rat : Hunger Reduction produced by Injecting (L. J. Herberg), 245
Glucose, Cellobiose and other Saccharides : Syntheses of, by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium (Dr. C. P. Jackson and K. Ramamurti), 942
Glucose (Blood), in the Rat adapted to a Fat Diet . An Inverse Relation between the Liver Glycogen and the (Dr. P. A Mayes), 325
Glucose, Methionine and Sodium Butyrate Reduction of the Intestinal Absorption of, by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
Glucuronosyl Transferase : Inhibition of, by Progestational Agents from Serum of Pregnant Women (Dr. David Yi-Yung Hsia, Robert M Dowben, Ralph Shaw and Aaron Grossman), 693
Glue Research Association, British Gelatine and : Nineteenth Meeting of the Research Panel, 998

Glutathione and Alloxan: Effect of, on the Photoperiodic Response of *Xanthium* (J. Nitsan), 81
Gluten (Wheat): Effect of, on the Peristaltic Reflex (Dr. R. Schneider, H. Bishop, Dr. B. Shaw and Prof. A. C. Frazer), 516
Glutinants et Matières d'Apprêts: Traité Général de la Fabrication des Colles des (Dr. Maurice de Keghel), nouvelle édition, *review* by Prof. A. G. Ward, 890
Glycerine: Effect of, on the X-Ray Sensitivity of *Serratia marcescens* (Dr. D. L. Dewey), 1008
Glycerol Medium (Lactate-buffered): Syntheses of Glucose, Cellobiose and other Saccharides by *Acetobacter acetigenum* in a (Dr. C. P. Jackson and K. Ramamurti), 942
Glycogen (Liver), and the Blood Glucose in the Rat adapted to a Fat Diet: An Inverse Relation between the (Dr. P. A. Mayes), 325
Glycolysis (Aerobic): Inhibition of, in Yoshida Ascites Hepatoma by Tartronic Acid (Dr. L. Fiume), 792
Glycosidases: The β-D-Fucosidase Activity of Mammalian Tissues and its relation to other (Dr. G. A. Levvy), 1027
Glycyrrhetinic Acid: Antileukaemic Activity of (Dr. W. Logemann, F. Lauria, G. Cudkowicz and J. Franceschini), 607
Gobi Mountains: Tectonics of the (V. P. Solonenko and N. A. Florensov), 373
God: The Masks of—Primitive Mythology (Dr. Joseph Campbell), *review* by Dr. K. O. L. Burridge, 7
Goddard, C. K.: Physiological Media for Tissues of *Helix*, 68
Goddard, Prof. L. S.: Theories of Figures of Celestial Bodies, *review*, 890
Goddard, Dr. Robert H.: Awarded posthumously the Langley Medal of the Smithsonian Institution, Washington, 201
Godwin, Felix: The Exploration of the Solar System, *review* by D. G. King-Hele, 811
Goitre Conference: The Fourth International (Prof. C. Rimington and Dr. R. A. Miley), 651
Goitrogenesis in the Rat: Comparison of Iodine-124 and Iodine-131 in Inhibition of (Dr. I. Doniach and Dr. P. E. Francois), 704
Gold, Eleanor, and others: Effect of Lysergic Acid Diethylamide on Larval Growth, 153
Gold–Silicon Alloys: Non-crystalline Structure in Solidified (W. Klement, Jun., R. H. Willens and Prof. Pol Duwez), 869
Golden, Jack S. (Graber, Richard R., and): Population Trends among Hawks and Owls in Illinois (Illinois Department of Registration and Education, Biological Notes No. 41, 999
Goldfinger, Prof. P., and others: Mass Spectrometric Investigation of the Vaporization of Sulphides and the Dissociation Energy of S_2, 408
Goldie, Dr. L., and Green, Dr. J. M.: Paradoxical Blocking and Arousal in the Drowsy State, 952
Golding, E. W., and Tabor, Dr.: Problems of the Arid Zones (Local Energy Sources), 295
Golding, R. M.: Ultra-Violet Absorption Spectra of the Molecules H_2O, HDO and D_2O, 139
Goldman, Prof. Leon, and others: Absence of Local Cytotoxic Change in Man from Griseofulvin, 335
Goldsmid, H. J., and Bowley, A. E.: Thermal Conduction in Mica along the Planes of Cleavage, 864
Goldsmiths' College, London: Foundation Oration, The Diffusion of Knowledge (Dr. Michael Grant), 371
Goldstein, David A., and others: Evidence for Internal Organization of Nucleic Acid in T_2 Bacteriophage, 781
Goldstein, Prof. L., and others: Diamagnetic Moment of Gaseous Plasmas measured by Spin Resonance Techniques, 584
Goldstein, Dr. M., and Gertner, Dr. S. B.: Formation of a New Metabolite of Epinephrine and Norepinephrine in Liver and Kidney, 147
Golgi Bodies (so-called): Cytochemical Evidence of the Origin of Lipid Bodies, from Mitochrondria (H. C. Chopra), 713
Golovinsky, Dr. E. V., and others: Adaptive Chain in the Conversion of Antimetabolites into Metabolites, 1041
Goma, L. K. H.: Experimental Breeding of *Anopheles gambiae* Giles in Papyrus Swamps, 1137
Gonads in Parasitic and Non-Parasitic Lampreys: Development of the (M. W. Hardisty), 341
Goodman, C. H. L.: Ionic-Covalent Bonding in Crystals, 590
Gordienko, P. A.: Recent Progress of the work of the Arctic Drift Expeditions, 287
Gorter, C. J.: At the Tenth General Physics Conference of the Swedish National Committee for Physics (Problem of Orienting Atomic Nuclei at Low Temperatures), 557
Goswami, Ajit, and Sadhu, Prof. D. P.: Polyenoic Acid in Hypercholesterolaemia Induced by Pyridoxine Deficiency in Rats, 766
Goto, Dr. Yoshio, and others: High-Energy Bound Phosphate and Diabetes Mellitus, 702
Gould, R. D., and others: Recombination of Oxygen Atoms in the Gas Phase, 686
Gould, R. P.: Sensory Innervation of the Anal Canal, 337
Gourevitch, Dr. A., and others: Bacterial Penicillin Amidase, 237
Government (State): Science and—a Study of the Scientific Activities of State Government Agencies in Six States (Dr. Frederic N. Cleaveland), *review* by R. Brightman, 181
Government Chemist: Report for 1958-59, 1076
Govindachari, Prof. T. R.: The Chemistry of Natural Products (Recent Investigations on some Alkaloids from Indian Plants), 1080
Gowland, Dr. G.: Antibody Responses of the Domestic Fowl to Two Soluble Bacterial Antigens, 624
Gowland, Dr. G. (Willis, Dr. A. T., and): Egg-Yolk Reactions of *Pseudomonas* Species, 432
Graber, Richard R., and Golden, Jack S.: Population Trends among Hawks and Owls in Illinois (Illinois Department of Registration and Education, Biological Notes No. 41), 999
Graddon, Dr. D. P., and Watton, E. C.: Structure of the 1:1-Adducts of Cupric β-Diketone Chelates with Heterocyclic Bases, 1021
Grade (Low-) Mental Deficiency in a Large Swedish Rural Population: A Clinical and Genetico-Statistical Study of Schizophrenia and (Bertil Hallgren and Torsten Sjogren), 298.
Graduate Research Laboratories: Grants for (United States National Science Foundation), 559
Graduate Schools in British Universities (Prof. W. R. Niblett), 560
Graham-Jones, Oliver: Tuberculosis in Animals (Disease in Zoo Animals), 997
Grainger, Prof. J. N. R.: *Obituary* of Prof. J. Bronte Gatenby, 990
Grainger, L.: Appointed assistant director of the Atomic Energy Research Establishment, with special responsibilities for applied research, 536
Gram-positive Bacteria: An Antibiotic Complex derived from a *Streptomyces* and Active against (B. Sgarzi, A. M. Lugli and G. Gioletti), 1029
Gramineae: Pollen Germination in some—*Pennisetum typhoideum* (Dr. I. K. Vasil), 1134
Granick, David: The Red Executive, 537
Granit, Prof. Ragnar: Elected to foreign membership of the Royal Society, 112; work of, 112
Granites: The Average Composition of, the Genesis of Tektites, and Petrogenesis (Prof. E. H. Timothy Whitten), 867
Grant, Jean (Dunsford, Dr. I., and): The Anti-Globulin (Coombs) Test in Laboratory Practice, *review* by Dr. R. Drummond, 357
Grant, Dr. Michael: The Diffusion of Knowledge (Foundation Oration at Goldsmiths' College, London), 371
Grant, Prof. W. F.: Chromosome Numbers in *Amaranthus*, 28
Grants for Graduate Research Laboratories (United States National Science Foundation), 559
Grants for Assistance in Research in any branch of Chemistry (Chemical Society), 466
Grants for Space Research in Britain, 744
Grants and Awards for 1961 (Lalor Foundation), 1078
Grants (Training), in Plastics Technology (Plastics Institute), 28
Granules (Melanin), and Mitochondria (Dr. Ruth V. Baker, M. S. C. Birbeck, Dr. H. Blaschko, Prof. T. B. Fitzpatrick and Dr. M. Seiji), 392
Grape Vines in Europe and North America: Sap-Transmissible Viruses associated with Diseases of (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
Graphitic Perfection (Different): Dependence on Temperature of the Interlayer Spacing in Carbons of (E. G. Steward, B. P. Cook and E. A. Kellett), 1015
Grass: Lead-210 and Polonium-210 in (C. R. Hill), 211
Grasses (Pasture): Fatty Acid Composition of the Lipids of (Dr. G. A. Garton), 511
Grassland Productivity: The Measurement of—Proceedings of the University of Nottingham Sixth Easter School in Agricultural Science, 1959 (edited by Prof. J. D. Ivins), *review* by Dr. G. W. Cooke, 544
Gravitation: The Theory of Space, Time and (V. Fock), translated from the Russian by N. Kemmer, *review* by Dr. D. W. Sciama, 4
Gravitational Potential (Earth's): Evaluation of the Second, Fourth and Sixth Harmonics in the (D. G. King-Hele), 490
Gravitational Potential (Galactic): Gravitational Red Shift of Hydrogen 21-cm. Radiation as a Method to measure (L. F. Landovitz and L. Marshall), 223
Gravitational Red Shift of Hydrogen 21-cm. Radiation as a Method to measure Galactic Gravitational Potential (L. F. Landovitz and L. Marshall), 223

Horizons (New), in Chemistry (Sir Alexander Todd), 819
Horlock, Prof. J. H. : Combustion and Propulsion—High Mach Number Air-breathing Engines (Research in Turbo-machinery), 21
Hormone (Anti-Diuretic), and Calcium : Effect of, on the Equivalent Pore Radius of Kidney Slices from *Necturus* (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Hormone (Human Growth) : Immunoelectrophoretic Studies on Purified (Dr. Jan Hirschfeld, Carl-Axel Gemzell and Leif Wide), 64
Hormone (Plant) Activity—Stilboestrol applied to the Wheat Seedling (Dr J. J. C. Hinton and Dr. T. Moran), 258
Hormone-like Response in *Hydra* : Enzymatic Activation of a, by Proteases (Dr. Howard M. Lenhoff and John Bovaird), 671
Hormones and Atherosclerosis—Proceedings of the Conference held in Brighton, Utah, 1958 (edited by Gregory Pincus), review by Dr. G. S. Boyd, 634
Horne (Robert) Memorial Lecture of the Society of Chemical Industry (Prof. F D. Richardson), 466
Horning, Dr. E. C. (Sweeley, C. C., and) : Microanalytical Separation of Steroids by Gas Chromatography, 144
Horse, Sheep and Dog (Man,) : Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in comparison with (Dr. C. J. G. van der Horst), 146
Horseshoe Crab : Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the (R. Kikuchi, K. Naito and S. Minagawa), 1118
Horta, Wanda A., and others : Race Differences in the Ability to excrete Beetroot Pigment (Betanin), 806
Horticulture and Plantation Crops, Commonwealth Bureau of : Technical Communication No. 25, Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), review by Dr. G. Haskell, 184
Horton, G. Robert (Wendlandt, Prof. Wesley W., and) : Differential Thermal Analysis of some Transition Metal Ethylenediamine Tetraacetic Acid Chelates, 769
Hosein, Prof. E. A., and Proulx, Peter : Isolation and Probable Functions of Betaine Esters in Brain Metabolism, 321
Hospitals (Paris) : Medical Research in the, 26
Host Plant Crop in Successful Biological Control of Insect Pests : Significance of the Type of (D. C. Lloyd), 430
Host-Range of *Lactobacillus* Bacteriophages (Prof. J. N. Coetzee, H. C. de Klerk and T. G. Sacks), 348
Hotchkiss, Dr. Rollin D. (Fox, Dr. Maurice S., and) : Fate of Transforming Deoxyribonucleate following Fixation by Transformable Bacteria (1), 1002
Houghton, Dr. J T. : Grant of £4,560 for Space Research (for the development of photoconductive material for satellite measurements of infra-red radiation), 744
House of Commons : Second Reading of the International Development Association Bill, 266
 Adjournment Debate on the Overseas Civil Service, 371
 Second reading of the Commonwealth Teachers Bill, 441
 Debates on Science and Education, 906
Howarth, Dr. (Ozeki, Dr., and) : Genetic Recombination in *Salmonella typhimurium* occurring during Transmission of Colicinogeny, 649
Howe, Dr. E. D. : Problems of the Arid Zones (Saline Water Conversion), 295
Howie, A. : Elected to a Junior Research Fellowship of Churchill College, Cambridge, 742
Howitt, D. : A Method for the Routine Measurement of Particle Shape Factors in the Sieve Range, 403
Hoyle, Prof. Fred : Obituary of Walter Baade, 1075
Hsia, Dr. David Yi-Yung, and others : Inhibition of Glucuronosyl Transferase by Progestational Agents from Serum of Pregnant Women, 693
Hsu, Konrad C., and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094
Hudson, Jack W., and Taylor, Charles R : Variability in Levels of Blood Uric Acid in Five Species of Birds, 788
Hughes, Dr. R. Elfyn. Appointed director of the Bangor Research Station of the Nature Conservancy, 744
Hull Electronic Engineering Society (Institution of Electronics, with the co-operation of the) : Electronics and Instruments Exhibition and Convention, 650
Hultin, T. (von der Decken, A., and) : Cytoplasmic Particles and their Role in Protein Synthesis, 645
Human Aortic Tissue : Presence of Neutral Carbohydrates in (Dr. Sv. Bertelsen), 411
Human Arterial Tissue : Effect of Testicular Hyaluronidase on the Permeability of (Jørgen Matzke), 873
Human Blood Group Antigen, Sw^a : A 'New' (Dr. T. E Cleghorn), erratum, 743
Human Bone : Radioactive and Natural Strontium in (J. W. Arden, J F. Bryant, E. H. Henderson, G. D. Lloyd and A G. Morton), 994
Human Environment : Mode of Formation of 3,4-Benzopyrene in (Prof. G. M. Badger, R. W L. Kimber and T. M Spotswood), 663
Human Genetics, American Journal of : Symposium on Cytology and Cell Culture Genetics of Man, 116
Human γ-Globulin : Cleavage of (Dr. Rose Augustin and Barbara J. Hayward), 129
 Presence of Immunologically Active Fragments after Proteolytic Degradation of (L. A Hanson and B. G. Johansson), 599
Human Growth Hormone : Immunoelectrophoretic Studies on Purified (Dr. Jan Hirschfeld, Carl-Axel Gemzell and Leif Wide), 64
Human Insulin Amino-Acid Sequence of (Dr. D. S. H. W. Nicol and Dr. L. F. Smith), 483
Human Pituitary. Polypeptides of the, with Direct Action on Metabolism (Dr. J. Bornstein and Deirdre Hyde), 125
Human Placenta : Steroid 11 β-ol Dehydrogenase in (Dr. P. A Osinski), 777
Human Plasma : Staining for Iodine in Chromatograms of—an Artefact due to Thioureas or Thiouracils (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C R Turner), 691 ; erratum, 1079
Human Potentialities (Dr. Gardner Murphy), review by Dr. D. J. West, 270
Human Red Cells : Adenosine Triphosphate and Maintenance of Shape of the (Mahoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Human Sera (Normal) : Immuno-Electrophoretic Differentiation of Haptoglobins from another Group-Specific Inheritable System in (Dr. Jan Hirschfeld), 126
Human Serum : Isolation of Material with Proactivator Activity from (H. B. W. Greig and Elsie M. Cornelius), 1125
Human, Term Placental 17β-Œstradiol Dehydrogenases : Histochemical Localization of—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Human Tumours : Polyploidy in (N. B. Atkin and Angela J. Ross), 579
Human and other Animal Cellulose (Dr. D. A. Hall and H. Saxl), 547
Human and Veterinary Medicine (Dr. W. J. Hayes, Jr., Dr. S. W. Simmons and Dr. E. F. Knipling), (edited by Dr. S. W. Simmons), (DDT—the Insecticide DDT and its Significance, edited by Paul Müller, Vol. 2), review by Prof. D. S. Bertram, 271
Humans (Premature Neonatal) : Delayed-type Hypersensitivity in (Jonathan W. Uhr, Joseph Dancis and Charlotte Grantz Neumann), 1130
Humpback Whale of Known Age : Marked (Dr. R. G. Chittleborough), 164
Humphrey, Dr. J. H. : Serum Albumin Concentration in Analbuminaemia and its Immunological Significance, 304
Humphreys, J. G., and Owen, Prof. Walter S. : An Iron—Silicon Carbide, 589
Hungate, Dr. F. P. (Uhler, Dr. R. L., and) : Relative Availability of some Strontium-90 Compounds in Soil, 252
Hunger Reduction produced by Injecting Glucose into the Lateral Ventricle of the Rat (L. J. Herberg), 243
Hunter, G. D. : Cytoplasmic Particles and their Role in Protein Synthesis (Complexes between Amino-Acids and Lipids in *Bacillus megaterium*), 643
Huntley, Dr. H. E. : The Faith of a Physicist, review by Dr. H. D. Anthony, 1063
Husbandry (Animal), at Bristol, 647
Husbandry Farms (Terrington and Kirton Experimental), King's Lynn : Appointment of F. E. Shotton as director, 905
Hutchinson, D. W., and others : Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates, 59
Hutchinson, G. W. : 'Memories' for Nuclear Physics (Duddell Medal Address to the Physical Society), 854
Hutchinson, J. N., and others : The Making of the Broads, review by Miles Burkitt, 636
Hutchinson, William D. (Vinograd, Dr. Jerome, and) : Carbon-14 Labelled Hybrids of Haemoglobin, 216
Hutchison, Dorris J., and others : Transformation of Resistance to 8-Azaguanine in *Diplococcus pneumoniae*, 800
Hutton, Dr. S. P. : Appointed to the new chair of mechanical engineering in the University College of South Wales and Monmouthshire, Cardiff, 117, 555 ; work of, 555
Huxley, A. F. : Appointed Jodrell professor of physiology at University College, London, 371 ; work of, 371
Huxley, Dr. H. E., and Zubay, G. : Cytoplasmic Particles and their Role in Protein Synthesis (Examination in the Ultracentrifuge of Ribosomes, using *Escherichia coli*), 644
Huxley, Sir Julian (editorial board : Dr. J. Bronowski, with Sir Gerald Barry, James Fisher and) : Science—Chemistry, Physics, Astronomy, review by Dr. D. R. Dickinson, 978
Huxley, Prof. L. G H. : Appointed vice-chancellor of the University of Canberra, 290
Huxley Memorial Medal for 1961 of the Royal Anthropological Institute awarded to Dr. A. E. Mourant, 114
Hyaluronic Acid : Exclusion of Inulin from Solutions of (Dr. A. G. Ogston and C. F. Phelps), 1024

Hyaluronidase (Testicular) : Effect of, on the Permeability of Human Arterial Tissue (Jorgen Matzke), 873
Hybrid (*Antirrhinum* Species) : Autogenous Necrosis in an (B. J. Harrison), 527
Hybrids (Carbon-14 Labelled), of Haemoglobin (Dr Jerome Vinograd and William D Hutchinson), 216
Hybrids (Interspecific), of the Liverwort *Sphaerocarpos* Maternal Inheritance and (Dr. William T. Doyle), 429
Hybrids (Interspecific) of *Tilapia*—*T nigra* x *T zillii* (P. J. Whitehead), 878
Hyde, Deirdre (Bornstein, Dr. J , and) : Polypeptides of the Human Pituitary with Direct Action on Metabolism, 125
Hydra . Enzymatic Activation of a Hormone-like Response in, by Proteases (Dr. Howard M. Lenhoff and John Bovaird), 671
Hydration Effect of, on Hexobarbitone-induced Sleep in Mice (Dr. N. K. Bhide), 1030
Hydrides of Iron and Osmium : Some New (Dr J Chatt, F. A. Hart and R. G Hayter), 55
Hydrocarbons of High Molecular Weight : Gas-Solid Chromatographic Separation of (C. G Scott and D. A. Rowell), 143
Hydrocarbons (Aliphatic) . Radiation-induced Nitration of (Dr. Tyson Rigg), 933
Hydrocarbons (C_4–C_6) : Two Highly Selective Solvents for Gas-Liquid Chromatography Analysis of (Dr A van der Wiel), 142
Hydrocarbons (Terpene) . Radiolysis of—Isomerization and Polymerization of α- and β-Pinene (T. H. Bates and Dr. T. Ffrancon Williams), 665
Hydrocracking of Neopentane and Neohexane over Evaporated Metal Films (Dr. J R. Anderson and B G. Baker), 937
Hydrogen : Stabilization of Austenite by (E. G. Ramachandran and C. Dasarathy), 684
Hydrogen Line : A New Limit to the Galactic Magnetic Field set by Measurements of the Zeeman Splitting of the (Dr. R. D. Davies, C. H. Slater, W. L H. Shuter and P. A. T Wild), 1088
Hydrogen 21-cm Radiation · Gravitational Red Shift of, as a Method to measure Galactic Gravitational Potential (L. F. Landovitz and L. Marshall), 223
Hydrogen-like Excitons . Effect of Electric Fields on (J. W. Allen), 51
Hydrogen 'Peroxide-16,16 : Radiolysis of Highly Enriched Oxygen-18 Water Solutions containing (Dr. Michael Anber, Shmuel Guttmann and Prof. Gabriel Stein), 57
Hydrographic Department (Royal Navy) : Retirement of Rear Admiral K. St B. Collins as hydrographer to the Navy, 285
  Appointment of Rear Admiral E. G. Irving as hydrographer to the Navy, 286
Hydrolysis (Enzymatic) . Formation of 6-Aminopenicillanic Acid from Penicillin by (Dr G. N. Rolinson, F. R. Batchelor, D. Butterworth, J. Cameron-Wood, Dr. M Cole, G C Eustace, Marian V. Hart, Dr. M. Richards and Prof E. B Chain), 236
Hydromechanics Research Association (British) : Twelfth Annual Report (1958-59), 26
Hydroxide (*N* Sodium) : Ammonia released on Treating Soils with, as a Possible Means of Predicting the Nitrogen-supplying Power of Soils (A. H. Cornfield), 260
Hydroxide (Sodium), In Water : Interaction of Picric Acid with (Takehiro Abe), 234
Hydroxy Compounds (Aromatic) : Effect of some, on the Phagocytic Activity of the Reticulo-Endothelial System (Prof. T. Nicol, C. Druce and C. C. Ware), 422
Hydroxylation of α-Pinene · Microbiological Transformation of Terpenes—(P. K. Bhattacharyya, B. R. Prema, B D. Kulkarni and S. K. Pradhan), 689
Hydroxyproline and the Shrinkage Temperature of Collagen (D. J. Rigby and Dr. J. D. Spikes), 150
5-Hydroxytryptamine . Influence of, on Renal Function in Extracorporeal Circulation (Dr. M. H. Frick), 609
  Mast Cells and, in Precancerous Mouse Skin (Dr. R. E. Coupland and Dr. J. F. Riley), 1128
5-Hydroxytryptamine in Cerebrospinal Fluid (A. Akcasu, M. Akcasu and S. B. Tumay), 324
Hygiene and Sanitation In Aviation : Guide to (World Health Organization of the United Nations), 911
Hyland, P. G., and others : Abnormal Crimping In Merino and Polwarth Wools, 960
Hynes, Dr. H. B. N. : The Biology of Polluted Waters, *review* by Dr. G. C. Ware, 1061
Hypercholesterolaemia induced by Pyridoxine Deficiency in Rats : Polyenoic Acid in (Ajit Goswami and Prof. D. P Sadhu), 786
Hyperconjugation Necessary ? Is (C N. R Rao), 913
Hypergeometric Functions Confluent (Dr. L. J. Slater), *review* by Prof W. N. Bailey, 93
Hypersensitivity (Delayed-type), in Guinea Pig Embryos : Development of (Jonathan W. Uhr), 957
Hypersensitivity (Delayed-type), in Premature Neonatal Humans (Jonathan W. Uhr, Joseph Dancis and Charlotte Grantz Neumann), 1130
Hypersensitiveness (Delayed-type Iso) : Natural Occurrence of (Dr. Jack R Battisto), 69
Hypertension : Drugs for the Treatment of (Manchester and District Section of the Royal Institute of Chemistry, and the Manchester Section and Fine Chemicals Group of the Society of Chemical Industry Symposium on), 743
Hypertensive Rats (Metacorticoid) : Electro-shock Seizure Threshold of (Dr F. M. Sturtevant), 874
Hypertrophy (Compensatory) Radiosensitivity of Mouse Kidney undergoing (Lieut. V. J. Rosen, jun., and Dr. L. J. Cole), 612
Hypothalamic System (Neurosecretory) : Antigonadotropic Function of the Pineal Gland and the Oxytocin of the (Prof. S.-M. Milcou and S. Pavel), 950
Hypothesis of Contraction in Striated Muscle (Dr. M. Spencer and Dr. C. R. Worthington), 388

ICE : Crystal Structures of the High-Pressure Forms of—Ice III (Prof. W. Barclay Kamb and Sankar K. Datta), 140
Identification of Blood-Group Antigens, *review* by Dr. R Drummond, 357
Identification of Transplanted Bone Marrow Cells in Radiation Chimaeras (P. Czarski, O Rosiek and J. Sabliński), 955
Identity of Natriferin, the Frog Water-Balance Principle and Arginine Vasotocin : Evidence for the (Prof. Wilbur H. Sawyer), 1030
I.G.Y., Year of Discovery—the Story of the International Geophysical Year (Prof. Sydney Chapman), *review* by Prof. S. K Runcorn, 185
Ikeda, Yonosuke (Kohiyama, Masamichi, and) · Appearance of New Deficient Characters in Streptomycin-resistant Mutants of *Bacillus subtilis*, 168
Ilan, Judith, and Guggenheim, Prof K. : Lack of Haematopoietic Potency of Liver of Mice fed on a Meat Diet, 698
Ilio-Sacral Joint (Expanded), in the Toad *Xenopus laevis* (Margaret Palmer), 797
Ill The Wish to Fall—a Study of Psychoanalysis and Medicine (Dr. Karin Stephen), *review* by Dr. Clifford Allen, 978
Illinois : Population Trends among Hawks and Owls in (Richard R. Graber and Jack S. Golden), 999
Illinois Department of Registration and Education Biological Notes No. 41, Population Trends among Hawks and Owls in Illinois (Richard R Graber and Jack S Golden), 999
Illinois Institute of Technology . International Symposium on Photo-elasticity, 650
Images (Electron Microscope), of Dislocations (Dr. Hatsujiro Hashimoto and Dr. Kazuo Fujita), 51
Imaginal Diapause in *Coccinella 7-punctata* L. Prevention and Artificial Induction of the (I. Hodek and J. Cerkasov), 345
Imaging Systems : Aspheric (Dr. C. R. Burch), 854
Imanishi, M. (Kawamata, Prof. J., and) : Interaction of Actinomycin with Deoxyribonucleic Acid, 1112
Immature Simuliidae : Attachment of, to other Arthropods (Dr D. J Lewis, E T. Reid, R W Crosskey and J. B. Davies), 618
Immunity of Aphids to Insect Parasites (D C Griffiths), 346
Immunoelectrophoretic Demonstration of Precipitating Components in Sera from Pregnant Women (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
Immunoelectrophoretic Differentiation of Haptoglobins from another Group-Specific Inheritable System in Normal Human Sera (Dr. Jan Hirschfeld), 126
Immunoelectrophoretic Studies on Purified Human Growth Hormone (Dr Jan Hirschfeld, Carl-Axel Gemzell and Leif Wide), 64
Immunological Relationships between the Rat Glomerulus and Nephritogenic Streptococci (A. S. Karkovitz, S Howard Armstrong, Jun., and Daniel S. Kushner), 1095
Immunological Responsiveness : 6-Mercaptopurine in (Dr John L. Robinson and Dr. Charles L. Christian), 796
Immunological Significance Serum Albumin Concentration in Analbuminaemia and its (Dr. J H Humphrey), 304
Immunological Tolerance (Polyvalent), in Homologous Radiation Chimaeras (Alena Lengerová), 160
Immunologically Active Fragments · Presence of, after Proteolytic Degradation of Human γ-Globulin (L. A. Hanson and B. G. Johansson), 599
Impaired Potassium Transport : A Bacterial Mutant with (Dr. Stanley G. Schultz and Dr A K Solomon), 802
Imperial College of Science and Technology, London · Appointment of Dr. D. V. Ager as reader in geology, 117
  Appointment of Sir Willis Jackson to the chair of electrical engineering, 463
  Appointment of J. C. de Courcy Henderson to the readership in reinforced concrete structures, 466
  Title of professor of physics in the University of London conferred on Dr. H. Elliot, 466
  Appointment of Dr L. M. Jackman to the University of London readership in organic chemistry, 743
  Grants for Space Research—£7,275 to Dr. H. E. Elliot (for satellite measurements of the primary cosmic-ray energy spectrum), and £1,500 to Dr. H. E Elliot (for an investigation into cosmic-ray intensity variations at rocket altitudes) ; £7,935 to Dr S. H. Hall (for geomagnetic field measurements in the Earth's upper atmosphere), 744
Imperial College of Tropical Agriculture . To be merged into the University College of the West Indies, 374
Implications of Interdependence . NATO in the 1960's—the (Alastair Buchan), 179
Implications for the Transhydrogenase Reaction : Histochemical Localization of Human, Term Placental 17β-Œstradiol Dehydrogenases—(Dr Donald A. Kellogg and Dr George G. Glenner), 763
Importance of Phosphorus-32 In Consecutive Internal Irradiation : Localization by Autoradiography at −195°C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons— (Jean Chanteur and Pierre Pellerin), 472
Improved Feed for Experimental Fish (D. R. Swift), 1133
Improvement in the Ductility of Beryllium at High Temperatures (A. Brown, F. Morrow and A. J. Martin), 494
Inborn Error of Metabolism : Reversibility of an Inherited Metabolic Block— (Dr. Herman Zondek, Dr. Hannah E. Leszynsky and Dr Joseph A. Stein), 515
Incendiaries, Fireworks and Firearms, *review* by Prof. R. J Forbes, 272
Incompatible (Self-) Cocoa : Selfing in (D. R Glendinning), 170
Incompleteness (Physical), of Influenza Virus propagated in De-embryonated Eggs (Martin Hanig and Joseph M Stein), 40
Incorporate Thymidine into Deoxyribonucleic Acid : Capacity of Extracts from Prestarved *Escherichia coli* to (Dr. Daniel Billen), 1044
Incorporation of Acetate into Protein by Obligately Parasitic and Saprophytic Fungi (Dr Richard C. Staples and Dr. H P. Burchfield), 1040
Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea* : Influence of Localized Ultra-violet Irradiation on the (Prof. J. Brachet and Dr. J. M. Olszewska), 954
Increase of Esterase Activity during Intracellular Digestion In a Histophagous Ciliate (Dr. Miklós Muller, József Tóth and Prof. Imre Toro), 65
Increase (Local), of Intensity of Cosmic Radiation (J.-P. Legrand and A Helary), 397
Increments (Viscosity), of Non-ionized Molecules (Alfred Polson), 482
Indeterminate Frameworks (Statically) : A Historical Note on the Reciprocal Theorem and Theory of (T. M. Charlton), 231
Index-Catalogue of Medical and Veterinary Zoology (United States Department of Agriculture), Supplements 9 and 10, 559

Index Chemicus (Institute for Scientific Information, Philadelphia), No. 1, 993
Indexes for Scientific and Technical Reports (ASLIB Survey on), 372
India : Prehistoric, *review* by M. C. Burkitt, 94
India (Early), and Pakistan to Ashoka (Sir Mortimer Wheeler), *review* by M. C. Burkitt, 94
India's First Agricultural University, 556
Indian Council of Scientific and Industrial Research : Bibliography of Indian Scientific and Technical Publications, 199
Indian Council of Scientific and Industrial Research (Chemical Research Committee) : Symposium on Redox Processes, 650
Indian Ocean Expedition (Dr. G. E. R. Deacon), 561
Indian Scientific and Technical Publications : Bibliography of (Council of Scientific and Industrial Research, New Delhi), 199
Indian (South) People : Potassium Tolerance Tests in (Dr. G. Henrotte, G. Krishnamurthi and G. Ranganathan), 328
Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in *Brassica oleracea* L.: Biogenesis of Ascorbigen, 3-Indolylacetonitrile and (Dr. M. Kutáček, Dr. Z. Procházka and Dr. D. Grunberger), 61
Indoles : Non-Enzymic Reactions of, with Coenzyme I (Prof. S. G. A. Alivisatos, G. A. Mourkides and A. Jibril), 374
3-Indolylacetonitrile and Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in *Brassica oleracea* L. : Biogenesis of Ascorbigen, (Dr. M. Kutáček, Dr. Z. Procházka and Dr. D Grunberger), 61
Induced Fluorescence with Acridine Orange, after Osmium Fixation (W. J. Randles), 964
Induction (Artificial), of the Imaginal Diapause in *Coccinella 7-punctata* L. : Prevention and (I. Hodek and J. Čerkasov), 345
Industrial Health in Britain, 648
Industrial Property, International Association for the Protection of : Twenty-fourth Congress (H. C. Miller), 202
Industrial Research (Scientific and) : Co-operation and, 89
Industrial Uses of Radioisotopes (United Kingdom Atomic Energy Authority Course for Trade Union Officials), 905
Industrial World : Management in the—an International Analysis (Frederick Harbison and Charles S. Myers), 537
Industries (Coal, Electricity and Gas) : Capital Investment in the (Ministry of Power), 1055
Industries (Pulp and Board), in Britain : Scope for Expanding (J. J. MacGregor), 32
Industries (Pulp and Particle Board) : The Development of, and their Effect on Forest Management (Society of Foresters of Great Britain Discussion on), 32
Industry : Education and, 470
  Effectiveness in (W. E. Bargett), 378
  Ergonomics in (Department of Scientific and Industrial Research Conference on), 117
  Research and Development in (Dr. E. J. Solvay), 830
Industry (Chemical), in Basle : The Story of (published by Ciba Limited on the occasion of its 75th Anniversary), *review* by Dr. L. K. Sharp, 540
Industry (Nuclear Energy), in France : Electronic Equipment used in the (P. Desneiges, M Doireau, L. Koch and J. Weill), 1076
Infection (Primary Tuberculous) : Effect of a, on the Resistance of Male and Female Mice to Ectromelia (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Infection Process (Cucumber Mosaic Virus) : Direct Infra-Red Spectral Analysis of the (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Infections (*Leishmania donovani*) : Treatment of, with Surface-active Agents (Dr. J. D. Fulton), 1129
Infective Ribonucleic Acid from the Viruses of Talfan and Teschen Diseases (F. Brown and Doreen L. Stewart), 714
Inflammatory (Anti-) Activity of Salicylate (Dr. V. Marks and Dr. M. J. H. Smith), 610
Inflorescence (Terminal), in the Genus *Trifolium* : Axial Origin of the (Yvonne Aitken), 622
Influence of Different Types of Malnutrition on the ^{14}-C-Lysine Metabolism in Young Rats (Prof. Kurt Schreier and Corinna Kraeusz), 1117
Influence of Editors (Scientific Publications Council Discussion on), 120
Influence on the Effect of Vasoconstrictor Amines by Pretreatment with Reserpine (H. C. Sabelli), 784
Influence of 5-Hydroxytryptamine on Renal Function in Extracorporeal Circulation (Dr. M. H. Frick), 609
Influence of the Ionic Strength of the Medium on the Anaphylactic Sensitization of Isolated Tissues *in vitro* (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Influence of Localized Ultra-violet Irradiation on the Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea* (Prof. J. Brachet and Dr. M. J. Olszewska), 954
Influenza Virus propagated in De-embryonated Eggs : Physical Incompleteness of (Martin Hanig and Joseph M. Stearn), 40
Information (Ionospheric), from Satellite Signals (Dr. G. H. Munro), 1017
Information (Scientific), Institute for (Philadelphia) : *Index Chemicus*, No. 1, 993
Information Centre for Food Irradiation : International (European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires), 741
  Appointment of Pierre Lévêque as director, 741
Information Processing Societies, International Federation of : Formation of an, 655
Information Service (United States) : Title of *Atoms for Peace Digest* changed to *Science Horizons*, 902
Infra-red Examination of the Association of Cornea Proteins with Water (Dr. S. Bakerman and C. Mitchell), 1033
Infra-Red Frequency Shifts (R. S. Norrish), 142
Infra-Red Spectra of Amino-acids and related Substances in Water (Prof. Frank S. Parker and Prof. Donald M. Kirschenbaum), 386
Infra-Red Spectral Analysis (Direct), of the Cucumber Mosaic Virus Infection Process (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester) 1049
Ingestion of Quinic and Shikimic Acids : Excretion of Catechol after (Dr. A. N. Booth, D. J. Robbins, M. S. Masri and F. DeEds), 691
Ingold, Sir Christopher, and others : Orienting Effects in Octahedral Aquation, 477
Ingram, Dr. M. : Microbial Systematics, 191
Inheritable System (Group-Specific), in Normal Human Sera : Immuno-Electrophoretic Differentiation of Haptoglobins from another (Dr. Jan Hirschfeld), 126
Inheritance (Maternal), and Interspecific Hybrids of the Liverwort *Sphaerocarpos* (Dr. William T. Doyle), 429
Inherited Metabolic Block (Inborn Error of Metabolism) : Reversibility of an (Dr. Herman Zondek, Dr. Hannah E. Leszynsky and Dr. Joseph A. Stein), 515
Inhibited Rat Serum Acid Phosphatase : Total and *l*(+) Tartaric Acid (Dr. Z. Laron and B Epstein Halberstadt), 67
Inhibition of Aerobic Glycolysis in Yoshida Ascites Hepatoma by Tartronic Acid (Dr. L. Hume), 792
Inhibition of Auxin Transport : A Method for the Detection of (B. E. S. Gunning), 428
Inhibition at the Crayfish Neuromuscular Junction : A Second Mechanism of (Dr. Josef Dudel and Prof Stephen W. Kuffler), 247
Inhibition of Glucuronosyl Transferase by Progestational Agents from Serum of Pregnant Women (Dr. David Yi-Yung Hsia, Robert M. Dowden, Ralph Shaw and Aaron Grossman), 693
Inhibition of Goitrogenesis in the Rat · Comparison of Iodine-124 and Iodine-131 in (Dr. L Donach and Dr. P. E. Francois), 704
Inhibition of Growth by Actinomycin of *Neurospora crassa* : Action of Nucleic Acids on the (Dr. W. Kersten, Dr H. Kersten and Prof. H. M. Rauen), 60
Inhibition of Nodule Bacteria by an Antibiotic from Legume Seed Coats (J. A. Thompson), 619
Inhibition (Growth) : Cell Biology and (Cell Biology Programme of Unesco International Symposium on), 836
Inhibitor (Germination), of the Seed of Rice : Viability and (Prof. S. M Sircar and Manjula Biswas), 620
Inhibitor (Monoamine Oxidase) : Anti-Fertility Action of a (W. G. Spector), 514
Inhibitor (New), of Monoamine Oxidase (Dr. J. D. Taylor, A. A. Wykes, Y. C. Gladish and W. B. Martin), 941
Inhibitors (Specific), of the Adrenal Cortex (Prof. J. H. U. Brown), 985
Initial Stages of Oxidation of Coal (S. K. Chakrabartty, B. K. Mazumdar and A. Lahiri), 502
Initial Value of Metabolic Processes : Role of, in Oxygen Consumption Changes in Rats during Irradiation (Dr. A. Vacek), 76
Initiate and Propagate a Fatigue Crack in Mild Steel : Correlation of the Alternating Stresses required to (N. E. Frost), 233
Initiation of Chemical Reactions by Mechanical Forces (Dr. Robert Schourmann and Ivor S. Stringer), 587
Initiator (*n*-Butyllithium). Homogeneous Synthesis of Isotactic Polystyrene using (Dr. R. J. Kern), 410
Injected Chelating Agents : Sustained Action of (Dr. A. Lindenbaum and Dr. J. Schubert), 575
Injecting Glucose into the Lateral Ventricle of the Rat : Hunger Reduction produced by (L. J. Herberg), 245
Injection of Thymidine labelled with Tritium : Urinary Excretion of *β*-Amino-isobutyric Acid after (Dr. Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 956
Injection (Photo-) of Charge into Dielectric Liquids (M. J. Morant), 48
Injury (Liver), due to Murine Hepatitis Virus : Protection against (Dr. J. D. Judah, G. Bjotvedt and T Vainio), 507
Innervation (Sensory), of the Anal Canal (R. P. Gould), 337
Innes, Prof. K. Keith, and others : Ultra-violet Absorption Spectra of the Diazines, 500
Innes (The John) Institute (Dr. K. S. Dodds), 467
Inorganic Chemistry : Annual Reviews on, *review* by Dr. I. R Beattie, 4
  Comprehensive (edited by Prof. M. Cannon Sneed and Prof Robert C. Brasted), Vol. 7, The Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), *review* by Dr. K. W. Bagnall, 185
  Progress in (edited by F. Albert Cotton), Vol. 1, *review* by Dr. I. R. Beattie, 4
Inorganic Forms (Organic and) : Bacterial Effect and Radiophosphorus Assimilation in, in Salmon (Dr. P. N. Srivastava), 83
Insect : The Control of Growth and Form—a Study of the Epidermal Cell in an (Prof. V. B. Wigglesworth), *review* by Prof. R. Dennell, 631
  Growth and Form in an, *review* by Prof. R. Dennell, 631
Insect Parasites : Immunity of Aphids to (D. C. Griffiths), 346
Insect Pests : Significance of the Type of Host Plant Crop in Successful Biological Control of (D. C. Lloyd), 430
Insect Suction Traps : Vent-Axia, 559
Insect Tissue Culture : Growth by Cell Division in (Dr. B. M. Jones and L Cunningham), 1072
Insecticides (William O. Negherbon), (Handbook of Toxicology, Vol. 3), *review* by Prof. V. B. Wigglesworth, 544
Insects attacking *Striga* (D. V. Murthy), 959
Instrument Manual, third edition, *review* by S. Weintroub, 97
Instrument Symposium and Research Equipment Exhibit : Tenth Annual (United States National Institutes of Health), 559
Instrumentation : Chemical Plant—some Notes on the Use of Measuring Instruments (Association of British Chemical Manufacturers), 1079
  Health Physics (John S. Handloser), *review* by B. S. Smith, 9
Instruments (Measuring) : Chemical Plant Instrumentation—some Notes on the Use of (Association of British Chemical Manufacturers), 1079
Instruments (Nuclear Physics) : Application of Computer Techniques to (G. G. Scarrott), 854
Instruments and Measurements Conference and Exhibition : Fifth International (Royal Swedish Academy of Engineering Sciences and the Swedish Association of Technical Physicists), 374
Instruments (Electronics and), Exhibition and Convention (Institution of Electronics, with the co-operation of the Hull Electronic Engineering Society), 650
Insulation (Thermal) : Domestic Heating and (Building Research Station, Digest 133), 999
Insulator (Semi-) : Gallium Arsenide as a (J. W. Allen), 403
Insulin in Rats : Dextran and (Dr. L. H. Marshall and C. H. Hanna), 1118
Insulin (Human) : Amino-Acid Sequence of (Dr. D. S. H. W. Nicol and Dr. L. F. Smith), 483
Integrals (Stochastic Path) : A Remark on (Prof. M. S. Bartlett), 968
Integration of the Cape and Royal Greenwich Observatories, 464
Intense Radiation : Biological Effects of Exposure to, 910

Intensity of Cosmic Radiation : Local Increase of (J. -P. Legrand and A. Helary), 397
Inter-Library Communications : 'Telex' and, 558
Interaction of Actinomycin with Deoxyribonucleic Acid (Prof. J. Kawamata and M. Imanishi), 1112
Interaction of Picric Acid with Sodium Hydroxide in Water (Takehiro Abe), 234
Interactions of Science and Technology with Society, 1
Interactions (Solid—Solid), on Active Adsorbents (Dr. Philip Anthony and Prof Harry Zeitlin), 936
Intercomparisons (Precision), of Lead Isotope Ratios—Broken Hill and Mount Isa (F. Kollar, Prof. R. D Russell and T. J Ulrych), 754
Interdependence : NATO in the 1960's—the Implications of (Alastair Buchan), 179
Interference Systems in Virus-infected Plants : Possible Occurrence of (A D. Thomson), 761
Interferometry : Possible Discovery of Ion-Pairs by (Prof. R. N. O'Brien and C. Rosenfield), 935
Interferon-like Substance released from Tick-borne Encephalitis Virus-infected Chick Embryo Fibroblast Cells (Dr J. Vilček), 73
Intergovernmental Conference on Oceanographic Research, 647
Interlayer Spacing in Carbons of Different Graphitic Perfection : Dependence on Temperature of the (E. G. Steward, B. P. Cook and E. A. Kellett), 1015
Interlayers (Aluminium) in Clay Minerals, Montmorillonite and Vermiculite—Laboratory Synthesis (B. L. Sawhney), 261
Internal Irradiation (Consecutive) : Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in (Jean Chanteur and Pierre Pellerin), 472
Internal Organization of Nucleic Acid in T_2 Bacteriophage : Evidence for (Irwin J. Bendet, David A. Goldstein and Max A. Lauffer), 781
Internal Sources (Standardized), of Phosphorus-32 · Radiolytic Oxidation of Ferrous Solutions with (Dr. M. Peisach and J. Steyn), 58
Internally Deposited Americium · Removal of, by Chelating Agents (Dr. F D. Sowby and Dr. D M Taylor), 612
International (Premier Colloque), de Photographie Corpusculaire, Strasbourg, 1957, *review* by D. L. Allan, 636
International Association for the Protection of Industrial Property : Twenty-fourth Congress (H. C. Miller), 202
International Atomic Energy Agency : Review Series No. 3, Electronic Equipment used in the Nuclear Energy Industry in France (P. Desnetges, M. Doireau, L. Koch and J. Weill), 1076
International Bank for Reconstruction and Development : Articles of Agreement of the proposed International Development Association, as approved for submission to Governments by the Executive Directors of the, 266
International Colloquium on the Physics of Electrostatic Forces and their Applications (Centre National de la Recherche Scientifique), 466
International Commission for Uniform Methods of Sugar Analysis—Report of the Proceedings of the Twelfth Session, Washington, D.C., 1958, *review* by Prof. E. L Hirst, 9
International Conference on High-Energy Physics Tenth Annual (Commission on High Energy Physics of the International Union of Pure and Applied Physics), 29
International Conference on Nuclear Structure, 290
International Conference on Semiconductor Physics (Czechoslovak Academy of Science), 29
International Congress of Applied Mechanics . Tenth, 201
International Congress of Blood Transfusion · Eighth (Japanese Red Cross Society), 201
International Congress on Experimental Mechanics, 559
International Congress of Food Science and Technology, 905
International Congress on Histochemistry and Cytochemistry (Société Française d'Histochimie), 29
International Congress for Logic, Methodology and Philosophy of Science (International Union for History and Philosophy of Science), 201
International Congress on Nutrition . Fifth (International Union of Nutritional Sciences, the American Institute of Nutrition and the United States National Committee, and the International Union of Nutritional Sciences of the United States National Academy of Sciences—National Research Council), 201
International Congress of Pure and Applied Chemistry : Seventeenth (International Union of Pure and Applied Chemistry), 29, *erratum*, 117
International Congress on the Technology of Plastics Processing (Association for the Advancement of the Knowledge of Materials, the Royal Institute of Engineers, the Royal Netherlands Chemical Federation and the International Union of Pure and Applied Chemistry), 559
International Co-ordination of Time Signals and Standard Frequency Transmissions (Dr. L. Essen), 452
International Council for Bird Preservation : Annual Report for 1959, 287
International Council of Scientific Unions · Year Book for 1960, 198
International Course on Lyophilization (Association des Cours Internationaux de Lyophilization), 29
International Cytology, *review* by the late Prof. J. Bronte Gatenby, 632
International Development Association : Articles of Agreement as approved for submission to Governments by the Executive Directors of the International Bank for Reconstruction and Development, and Accompanying Report of the Executive Directors, 266
International Federation of Information Processing Societies : Formation of an, 655
International Geophysical Co-operation, 1959 Recent Scientific Activities at Halley Bay— (M. J Blackwell), 982
International Geophysical Year : I.G Y., Year of Discovery—the Story of the (Prof. Sydney Chapman), *review* by Prof. S K. Runcorn, 185
International Geophysical Year Observations : Distribution of Atmospheric Ozone —a Preliminary Analysis of some (J. MacDowall), 382
International Goitre Conference . Fourth (Prof. C. Rimington and Dr. R. A. Miley), 651
International Information Centre for Food Irradiation (European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires), 741
  Appointment of Pierre Lévèque as director, 741
International Instruments and Measurements Conference and Exhibition : Fifth (Royal Swedish Academy of Engineering Sciences and the Swedish Association of Technical Physicists), 374
International Meteorological Organization Prize awarded by the World Meteorological Organization to Prof. J. van Mieghem, 740
International Pharmacological Meeting First (Section of Pharmacology of the International Union of Physiological Sciences), 29
International Plastics Exhibition : Second, 559
International Potash Institute : Potassium Symposium, 1958—Twelve Papers read at the Fifth Congress, *review* by Dr. P W. Arnold, 976
International Review of Cytology (edited by Prof G. H. Bourne and Prof, J F. Danielli), Vol 8, *review* by the late Prof. J. Bronte Gatenby, 632
International Review of Neurobiology (edited by Carl C. Pfeiffer and John R. Smythies), Vol. I, *review* by Dr D H. Brinton, 447
International Scientific Radio Union · Thirteenth General Assembly, 902
International Summer Course on Solid State Physics (Società Italiana di Fisica), 201
International Symposium on Cell Biology and Growth Inhibition (Cell Biology Programme of Unesco), 836
International Symposium on Chromatography (Belgisch Genootschap voor Pharmaceutische Wetenschappen), 374
International Symposium on Cori's Ester and Phosphorylated Glucides : First, 117, 290
International Symposium on Data Transmission (Benelux Section of the Institute of Radio Engineers, in co-operation with the Nederlands Radiogenootschap and the Group on Communications Systems of the Institute of Radio Engineers), 290
International Symposium on Photoelasticity (Illinois Institute of Technology), 650
International Union of Biochemistry and the International Union of Biological Sciences . Symposium on Biological Structure and Function, 905
International Union of Biological Sciences (International Union of Biochemistry and the) : Symposium on Biological Structure and Function, 905
International Union for History and Philosophy of Science : International Congress for Logic, Methodology and Philosophy of Science, 201
International Union of Nutritional Sciences of the United States National Academy of Sciences—National Research Council, and others : Fifth International Congress on Nutrition, 201
International Union of Physiological Sciences (Section of Pharmacology) : First International Pharmacological Meeting, 29
International Union of Pure and Applied Chemistry : Seventeenth International Congress of Pure and Applied Chemistry, 29, *erratum*, 117
International Union of Pure and Applied Chemistry (sponsored by the) : Symposium on the Chemistry of Natural Products (organized by the Australian Academy of Science), 1080
International Union of Pure and Applied Chemistry, and others : International Congress on the Technology of Plastics Processing, 559
International Union of Pure and Applied Physics : Tenth Annual International Conference on High-Energy Physics, 29
Interpretation of Cosmology (Dr. W. Davidson), 583 ; (Prof. W. H. McCrea), 583
Interspecific Hybrids of the Liverwort *Sphaerocarpos* : Maternal Inheritance and (Dr. William T. Doyle), 429
Interspecific Hybrids of *Tilapia*—*T. nigra* x *T. zillii* (P. J. Whitehead), 878
Interstellar Extinction and Polarization (R. Wilson), 288
Interval Analyser : A Biological (G K. Smith and Prof. B. Delisle Burns), 512
Intestinal Absorption of Glucose, Methionine and Sodium Butyrate : Reduction of the, by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
Intracellular Configuration and Dedifferentiation in *Splachnum ampullaceum* (L.) Hedw. (Prof. Kraft E. von Maltzahn and Mary M. MacNutt), 344
Intracellular Digestion in a Histophagous Ciliate · Increase of Esterase Activity during (Dr. Miklós Muller, József Tóth and Prof. Imre Toro), 65
Intracellular Localization of Enzymes (Centre Inter-universitaire de Recherches Enzymologiques Colloquium on), 836
Introduction to Genetics (Dr. C. M. M. Begg), *review* by Wilma George, 357
Introduction to Quantitative Genetics (Dr. D. S. Falconer), *review* by Prof. Kenneth Mather, 813
Introduction to Rubber Technology (edited by Maurice Morton), *review* by Dr. W. F. Watson, 359
Introduction to Symbolic Logic and its Applications (Rudolf Carnap), translated by William H. Meyer and John Wilkinson, *review* by P. I. G. Rawlins, 729
Inulin : Exclusion of, from Solutions of Hyaluronic Acid (Dr. A. G. Ogston and C. F Phelps), 1024
Invention (Engineering) : History of, *review* by J. L. Stollery, 8
Inverse Relation between the Liver Glycogen and the Blood Glucose in the Rat adapted to a Fat Diet (Dr. P. A. Mayes), 325
Investigating the Creep of Metals under Simple Shear : A Simple Method of (Prof E. N. da C. Andrade), 494
Investigation (Mass Spectrometric), of the Vaporization of Sulphides and the Dissociation Energy of S_2 (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Investigation (Quantitative), of the Echinoderm Fauna of the Central North Sea (Dr. Erik Ursin), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr. A. J. Southward, 360
Investigations on the Quantitative and Qualitative Distribution of Zooplankton in the Southern Part of the Norwegian Sea (V. K. Hansen), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A J Southward, 360
Investment (Capital), in the Coal, Electricity and Gas Industries (Ministry of Power), 1055
Iodate and Iodoacetate : Protective Effect of Cysteine against Retinal Degeneration induced by (Prof. Arnold Sorsby and Ronald Harding), 608
Iodine in Chromatograms of Human Plasma : Staining for—an Artefact due to Thiourea or Thiouracils (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691 ; *erratum*, 1079
Iodine-124 and Iodine-131 : Comparison of, in Inhibition of Goitrogenesis in the Rat (Dr. I. Doniach and Dr. P. E. Francois), 704

Iodine-131: The Ouchterlony Technique using Antigen or Antiserum labelled with (Joan M. Rhodes), 793
Sialoadenectomy and the Distribution of Thyrotrophin labelled with (Prof. Arthur W. Wase and Dr. Yu Sheng Louise Feng), 778
Iodine-131 (Iodine-124 and): Comparison of, in Inhibition of Goitrogenesis in the Rat (Dr. I. Doniach and Dr. P. E. Francois), 704
Iodoacetate: Protective Effect of Cysteine against Retinal Degeneration induced by Iodate and (Prof. Arnold Sorsby and Ronald Harding), 608
Ion (*tris* (Ethylenediamine) Cobalt (III): Catalytic Racemization of (Dr. F. P. Dwyer and Dr. A. M. Sargeson), 1022
Ion (Nitrate): Effect of, on the Distribution of Sucrose in the Rat's Ventricle (S. T. Taketa, C. G. Alexander and Prof. G. A. Feigen), 419
Ion (Perchlorate), in Sea-Water: Alleged Occurrence of the (R. Greenhalgh and Dr. J. P. Riley), 1107
Ion Exchanger (Cellulose): Non-specific Haemagglutinin from Cellulose and (Prof. B. Schmidt, Dr. K. Grossgebauer and D. Hartmann), 790
Ion-Pairs. Possible Discovery of, by Interferometry (Prof. R. N. O'Brien and C. Rosenfeld), 935
Ionic-Covalent Bonding in Crystals (C. H. L. Goodman), 590
Ionic Strength of the Medium: Influence of the, on the Anaphylactic Sensitization of Isolated Tissues *in vitro* (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Ionization Detector for Permanent Gases (Dr. J. E. Lovelock), 49
Ionization and Attachment Coefficients in *n*-Alkyl Chloride Gases (J. C. Devins and O. H. LeBlanc, Jun.), 409
Ionizing Radiations: Chemical Effects of, on Nucleic Acids and Nucleoproteins (P. Emmerson, Dr. G. Scholes, D. H. Thomson, J. F. Ward and Prof. J. Weiss), 319
Role of Oxygen in the Cross-linking and Degradation of Deoxyribonucleic Acid by (Peter Alexander and J. T. Lett), 933
Ionosphere: The Magneto-Ionic Theory and its Applications to the (J. A. Ratcliffe), *review* by Sir Harrie Massey, 810
Recent Trends in the Theory of the (J. A. Ratcliffe), 853
Ionospheric Drifts: Possibility of Detecting, from the Occurrence of Spread *F* Echoes at Low Latitudes (R. W. Knecht), 927
Ionospheric Information from Satellite Signals (Dr. G. H. Munro), 1017
Ionospheric Modification of the Radio Emission from Jupiter (Prof. Alex G. Smith, T. D. Carr, H. Bollhagen, N. Chatterton and F. Six), 568
Ionospheric Propagation of Electromagnetic Waves, *review* by Sir Harrie Massey, 810
Ions (Alkali Metal), in Analcite: Energies of Activation for Self-diffusion of (Prof. R. M. Barrer and L. V. C. Rees), 768
Ions (Bivalent Metal), in Transphosphorylation: Synergism of (Dr. John M. Lowenstein), 570
Ions (High-Energy Oxygen), in Carbon Dioxide Mass Spectra (R. M. S. Hall), 683
Ions (Manganous): Stabilization by, of Ribosomes from Embryonic Plant Tissue (Dr. J. W. Lyttleton), 1026
Ions (Metal). Fungitoxicity of (Dr. E. Somers), 427
Ions (Negative): Isotopic Analysis of Silicon by Solid-Source Mass Spectrometry using (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Iriki, Yoshihiko, and others: Xylan of Siphonaceous Green Algae, 82
Irish Sea Pleistocene History of the (G. F. Mitchell), 842
Iron (Serum), and Total Iron-binding Capacity in certain Mammals (Prof. Jose Planas and Sinnio de Castro), 1126
Iron-binding Capacity (Total), in certain Mammals: Serum Iron and (Prof. Jose Planas and Sinnio de Castro), 1126
Iron Meteorites: The Sulphide Phase in some (Dr. H. J. Axon), 406
Iron and Osmium: Some New Hydrides of (Dr. J. Chatt, F. A. Hart and R. G. Hayter), 55
Iron—Silicon Carbide. An (J. G. Humphreys and Prof. Walter S. Owen), 589
Iron and Steel Institute: Establishment of a new Gold Medal Award, 286
First award of the Gold Medal made to the Royal Society, 286
Irradiated with Ultra-violet Light: Recovery in the Presence of Chloramphenicol of *Escherichia coli* B (H), (Kenshi Suzuki and Yukiko Iwama), 347
Irradiated Rats: Synthesis of Diphosphopyridine Nucleotide in (Dr. D. K. Myers), 1124
Irradiation: Role of Initial Value of Metabolic Processes in Oxygen Consumption Changes in Rats during (Dr. A. Vacek), 76
Irradiation (Consecutive Internal). Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in (Jean Chanteur and Pierre Pellerin), 472
Irradiation (Food): International Information Centre for (European Productivity Agency of the Organization for European Economic Co-operation and the Centre d'Études Nucléaires), 741
Appointment of Pierre Lévêque as director, 741
Irradiation (Gamma), of Lead Silicate Glass (R. S. Barker, D. A. Richardson, E. A. G. McConkey and R. Rimmer), 135
Irradiation (Localized Ultra-violet). Influence of, on the Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea* (Prof. J. Brachet and Dr. M. J. Olszewska), 954
Irradiation (Ultra-violet): Delayed Recovery of Airborne *Serratia marcescens* after Short-Time Exposure to (Dr. R. L. Dimmick), 251
Irradiation (Whole-body): Effects of, on the Breeding Plumage of the Weaver Finch, *Quelea quelea* (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Labilization of Deoxyribonucleic Acid in Thymus Nucleoprotein after (Dr. Ulrich Hagen), 1123
Irradiation (X-): Changes in Conductivity of Pure Water caused by (K. Schmidt), 931
Irreversibility. Statistical Mechanics with special reference to (Institute of Physics and the Physical Society Conference on), 1079
Irrigation in Great Britain, 198
Irving, Rear Admiral E. G.: Appointed hydrographer to the Navy, 286; work of, 286
Is Hyperconjugation Necessary? (C. N. R. Rao), 913
Ishida, Takeo (Okada, Hideya, and): Hexagonal Modification of Black Chromium Electro-deposit, 496
Islam, Prof. Ahmad Shamsul: Unproductivity in the Colchicine-induced Tetraploids of *Annona squamosa* L., 343
Island (Pacific): Continuity in a Small, *review* by Sir Harry Luke, 816
Ismen, Hikmet (MacNeill, B. H., and): Virus-Streak Disease of Tomatoes, 903
Iso-hypersensitiveness (Delayed-type): Natural Occurrence of (Dr. Jack R. Battisto), 69
Isolated Cells: Measuring the Size of (Dr. Samuel S. Epstein and Jacqueline B. Weiss), 461
Isolated Tissues *in vitro*: Influence of the Ionic Strength of the Medium on the Anaphylactic Sensitization of (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Isolation of a δ-Lactone Compound from the Leaves of *Citona marina* Linn. (Dr. A. Sinha), 149
Isolation of Material with Proactivator Activity from Human Serum (H. B. W. Greig and Elsie M. Cornelius), 1125
Isolation of a Non-pathogenic Tumour-destroying Virus from Mouse Ascites (Dr. J. G. Bennette), 72
Isolation of a Phytoalexin from *Pisum sativum* L. (I. A. M. Cruickshank and Dawn R. Perrin), 799
Isolation of Plant Protoplasts and Vacuoles: A Method for the (Dr. E. C. Cocking), 962
Isolation and Probable Functions of Betaine Esters in Brain Metabolism (Prof. E. A. Hosein and Peter Proulx), 321
Isomerization and Polymerization of α- and β-Pinene: Radiolysis of Terpene Hydrocarbons— (T. H. Bates and Dr. T. Ffrancon Williams), 665
Isotactic Polystyrene: Homogeneous Synthesis of, using *n*-Butyllithium Initiator (Dr. R. J. Kern), 410
Isotope (Lead) Ratios: Precision Intercomparisons of—Broken Hill and Mount Isa (F. Kollar, Prof. R. D. Russell and T. J. Ulrych), 754
Isotopic Analysis of Silicon by Solid-Source Mass Spectrometry using Negative Ions (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Isotopic Composition and Temperature of Formation of Antarctic Snows (Prof. E. Picciotto, X. de Maere and Dr. I. Friedman), 857
Israel Programme for Scientific Translations, 832
Ito, Isao, and others: High-Energy Bound Phosphate and Diabetes Mellitus, 702
Ito, Dr. Toshio: Nutritive Values of Carbohydrates for the Silkworm, *Bombyx mori*, 527
Iversen, Dr. Simon: Absorbance of Feulgen-stained Somatic Cell Nuclei, 86
Ivins, Prof. J. D. (edited by): The Measurement of Grassland Productivity—Proceedings of the University of Nottingham Sixth Easter School in Agricultural Science, 1959, *review* by Dr. G. W. Cooke, 544
Iwama, Yukiko (Suzuki, Kenshi, and): Recovery in the Presence of Chloramphenicol of *Escherichia coli* B (H) Irradiated with Ultra-violet Light, 347

JACCODINE, R. J.: Crystal Growth in Paraffin, 498
Jackman, Dr. L. M.: Nuclear Magnetic Resonance, *review*, 358
Appointed to the University of London readership in organic chemistry at the Imperial College of Science and Technology, 743
Jackson, Dr. C. P., and Ramamurti, K.: Syntheses of Glucose, Cellobiose and other Saccharides by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium, 942
Jackson, J. S.: A Symmetrical Fourfold Helical Fracture in Titanium Oxide, 1104
Jackson, Sir Willis: Appointed to the chair of electrical engineering at the Imperial College of Science and Technology, London, 463; work of, 463
Jain, R. K.: *Ensete berryi*—Revised Name for *Musa ensetaeformis* Berry, 342
Jakab, Dr. L., and others: Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152
James, W. Warwick: The Jaws and Teeth of Primates, *review* by Sir Wilfrid Le Gros Clark, 891
Jane, Prof. F. W.: Combating the Decay of Timber, *review*, 977
Japanese Potassium Symposium—Nine Papers read at the First Japanese Symposium, 1957, *review* by Dr. P. W. Arnold, 976
Japanese Red Cross Society: Eighth International Congress of Blood Transfusion, 201
Japanese Scientific and Technical Books and Dictionaries: A collection of, presented to the Science Museum Library, London, on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
Jardetzky, Wenceslas S.: Theories of Figures of Celestial Bodies, *review* by Prof. L. S. Goddard, 890
Jasper, Dr. H. H.: Self-Regulation in Living Systems (Tremor—Experimental Measurements on Tremor, using Microelectrodes), 298
Jaspilite (Roast Reduced): Formation of Fayalite in (J. B. Lean, K. J. Tucker, B. O. Holland and T. R. Thomson), 683
Jaws and Teeth of Primates (W. Warwick James), *review* by Sir Wilfrid Le Gros Clark, 891
Jay, K. E. B.: The Nuclear Handbook, *review*, 273
Jeffery, Dr. J. W.. Exploring Vector Space, *review*, 975
Jeffery, R. A., and Smith, E.: Work-Hardening and Ductility of Rhenium and their relation to the Behaviours of other Metals having a Hexagonal Structure, 52
Jellinek, Dr. F.: Character of the Ligands in Dibenzene Chromium, 871
Jenkins, Prof. F. A.: *Obituary* by Dr. H. G. Kuhn, 990
Jennings, J. N., and others: The Making of the Broads, *review* by Miles Burkitt, 636
Jennison, Dr. R. C.: Grants for Space Research—£15,277 (for micrometeorite investigations from an Earth satellite), and £15,020 (for low-frequency radio astronomy from an Earth satellite), 744
Jericho, M. H.: Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Jeunehomme, M., and others: Mass Spectrometric Investigation of the Vaporization of Sulphides and the Dissociation Energy of S_2, 408
Jibril, A., and others: Non-Enzymic Reactions of Indoles with Coenzyme I, 374
Job in West African Religion: Oedipus and (Prof. Meyer Fortes), *review* by Michael Argyle, 96
Johansson, B. G. (Hanson, L. A., and): Presence of Immunologically Active Fragments after Proteolytic Degradation of Human γ-Globulin, 599
Johnson, B. E.: Potentiation of Hair-Growth by Ultra-Violet Light, 159
Johnson, R. F., and others: Fractionation of Nuclear Weapon Debris, 1100
Johnson, Matthey and Co., Ltd., London: Products of the Rare Earth Group, 832

Jones, Dr. B. M., and Cunningham, I.: Growth by Cell Division in Insect Tissue Culture, 1072
Jones, Dr. D. N.: Appointed lecturer in chemistry at the University of Sheffield, 466
Jones, F. R. Harden, and others: Echo Sounding Experiments in the Barents Sea, 855
Jones, Dr. G.: Appointed to the Sophie Fricke Royal Society Research Fellowship in the Rockefeller Institute, 1079
Jones, G. D.: Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Jones, Sir Harold Spencer: Space Research, review, 268
Jones, R. A. Y.: Elected to a Junior Research Fellowship of Churchill College, Cambridge, 742
Jones, Prof. R. V.: Some Developments of the Optical Lever (Duddell Medal Address to the Physical Society), 905
Jordan, Prof. Joseph, and others: 'Enthalpy Titrations' and Thermochemistry in Molten Salts, 318
Journals and Newspapers (British): Bibliography of, 116
Judah, Dr. J. D.: Phosphoproteins and Mitochondrial and Cell Water, 506
Intracellular Localization of Enzymes, 853
Judah, Dr. J. D., and others: Protection against Liver Injury due to Murine Hepatitis Virus, 507
Jude, P. E.: La Grotte de Rochereil, 903
Judgment: The Anatomy of (Dr. M. L. Johnson Abercrombie), review by Prof. O. L. Zangwill, 817
Juice (Passion Fruit): An Acid-tolerant and Non-sporulating Yeast from (B. A. S. Rao and J. S. Pruthi), 342
Junction Transistor and its Applications (edited by E. Wolfendale), review by Dr. J. R. Tillman, 1058
Jungherr, E. L. (edited by C. A. Brandly and): Advances in Veterinary Science, Vol. 5, review by Prof. H. Burrow, 448
Jupiter: Ionospheric Modification of the Radio Emission from (Prof. Alex G. Smith, T. D. Carr, H. Bollhagen, N. Chatterton and F. Six), 568

KABERRY, Dr. P. (Chilver, E. M., and): Awarded jointly the Wellcome Medal for 1959 of the Royal Anthropological Institute, 114
Kac, Prof. Mark: Probability and related Topics in Physical Sciences, review by Prof. M. S. Bartlett, 1060
Kafig, Dr. E.: Freezing and Drying of Biological Materials, 749
Kalinko, M. K.: Submarine Oil Drilling, 903
Kallio, Prof. Paavo: Morphogenetics of *Micrasterias americana* in Clone Culture, 164
Kalmus, Dr. H.: Evolutionary Theory after Mendel, review, 726
Kamb, Prof. W. Barclay, and Datta, Sankar K.: Crystal Structures of the High-Pressure Forms of Ice—Ice III, 140
Kanda, S., and others: Distribution of Protein-bound Aminoazo Dyes in the Rat Liver Microsome, 943
Kapa, Dr. Eszter (Csaba, Dr. G., and): Uptake of Heparin by Cells, 711
Kapp, Prof. Reginald O.: Towards a Unified Cosmology, review by Dr. C. W. Kilmister, 634
Kassanis, B., and Nixon, H. L.: Activation of One Plant Virus by Another, 713

Kellogg, Dr. Donald A., and Glenner, Dr. George G.: Histochemical Localization of Human, Term Placental 17β-Œstradiol Dehydrogenase—Implications for the Transhydrogenase Reaction, 763
Kelsall, R. K.: Appointed to the newly created chair of sociological studies in the University of Sheffield, 463; work of, 463
Kemény, Dr. T., and others: Damage to Liver induced by DL-Methionine-Ethylester, 421
Kendall, Dr. John D.: Appointed director of European research laboratories to be established by the Minnesota Mining and Manufacturing Co., Ltd., 905
Kennedy, A. J. (Murphy, A. J., and): Combustion and Propulsion—High Mach Number Air-breathing Engines (Materials Problems raised by the Very High Temperatures of Hypersonic Air-breathing Engines), 21
Kent, P. E. (Falcon, N. L., and): Geological Results of Petroleum Exploration in Britain by the British Petroleum Company during the Years 1945-57, 1078
Kern, Dr. R. J.: Homogeneous Synthesis of Isotactic Polystyrene using n-Butyllithium Initiator, 410
Kerr, A. J.: Awarded a Nature Conservancy Diploma Course in Conservation and Ecology at University College, London, 742
Kersten, Dr. H., and others: Action of Nucleic Acids on the Inhibition of Growth by Actinomycin of *Neurospora crassa*, 60
Kersten, Dr. W., and others: Action of Nucleic Acids on the Inhibition of Growth by Actinomycin of *Neurospora crassa*, 60
Keto-Acids in Blood Serum and Urine of Cattle: Occurrence of, in comparison with Man, Horse, Sheep and Dig (Dr. C. J. G. van der Horst), 146
Ketones (Fluorinated): Cage Effect in the Liquid-Phase Photolysis of (R. Bowles, Dr. J. R. Majer and Prof. J. C. Robb), 314
Ketosteroids: Spotting, review by Prof. G. A. D. Haslewood, 183
Kettlewell, Dr. H. B. D. (Cook, L. M., and): Radioactive Labelling of Lepidopterous Larvae—a Method of Estimating Late Larval and Pupal Mortality in the Wild, 301
Keuper Series: Nomenclature of the (P. A. Garrett), 868; (Dr. C. J. Stubblefield), 869
Keynes, Dr. R. D.: Influence of Editors, 120
Kidney: Formation of a New Metabolite of Epinephrine and Norepinephrine in Liver and (Dr. M. Goldstein and Dr. S. B. Gertner), 147
Kidney (Mouse), undergoing Compensatory Hypertrophy: Radiosensitivity of (Lieut. V. J. Rosen, jun., and Dr. L. J. Cole), 612
Kidney Capsule: Development of Mouse Eggs beneath the (D. R. S. Kirby), 707
Kidney Slices from *Necturus*: Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Kidrich (Boris) Institute of Nuclear Sciences: Bulletin, Vol. 10, 831
Kikuchi, Dr. Masatake, and Yamaguchi, Akira: Polyphenol Oxidase Activity of *Nicotiana glutinosa* Leaves infected with Tobacco Mosaic Virus, 1048
Kikuchi, R., and others: Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the Horseshoe Crab, 1118
Kilmister, Dr. C. W.: A Philosophy of Cosmology, review, 634
Kimber, R. W. L., and others: Mode of Formation of 3,4-Benzopyrene in Human Environment, 668
Kimmins, Dr. D. E.: A New Study of the British Odonata, review, 631
Kind, S. S.: Absorption-Elution Grouping of Dried Blood-stains on Fabrics, 789
Kinetics and Mechanism (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely and Dr. A. Wassermann), 662
King, Prof. E. J.: Influence of Editors, 121
King's College, London: Appointment of Dr. P. G. Saffman as reader in mathematics, 117
  Retirement of Prof. W. Robson from the chair of biochemistry, 286
  Appointment of Dr. H. Harris to the chair of biochemistry, 286
  Appointment of A. J. Fuller as reader in physiology, 466
King-Hele, D. G.: Satellites and Scientific Research, review by Sir Harold Spencer Jones, 268
  Evaluation of the Second, Fourth and Sixth Harmonics in the Earth's Gravitational Potential, 490
  Proposals for Space Flight, review, 811
Kingston Technical College: Postgraduate Course on Recent Advances in Steroid Chemistry, 905
Kirby, D. R. S.: Development of Mouse Eggs beneath the Kidney Capsule, 707
Kirschenbaum, Prof. Donald M. (Parker, Prof. Frank S., and): Infra-Red Spectra of Amino-acids and related Substances in Water, 386
Kishi, Nobusuke: Presentation to the Science Museum Library, London, of a collection of Japanese Scientific and Technical Books and Dictionaries, 201
Kistiakowsky, Prof. G. B.: Elected to foreign membership of the Royal Society, 112; work of, 112
Kitchener, Dr. J. A. (Bamford, Dr. C. H., and): Colloid and Polymer Science (Calculation of Free-radical Reactivity and Stability of Colloidal Model Suspensions), 378
Kitten: Hind-Limb Reflexes in the—Velocity of Conduction and Spinal Transmission of Proprioceptive Hind-Limb Reflexes (Dr. Sten Skoglund), 132; Properties of the Two-Neuron Arc (Dr. Sten Skoglund), 134
Klein, O.: At the Tenth General Physics Conference of the Swedish National Committee for Physics (Systematics of Elementary Particles), 557
Klement, jun., W., and others: Non-crystalline Structure in Solidified Gold–Silicon Alloys, 869
Klinkenberg, A., and Sjenitzer, F.: 'Eddy' Diffusion in Chromatography, 1023
Klug, A., and others: Cytoplasmic Particles and their Role in Protein Synthesis (Pattern of Ribosomal Ribonucleic Acid in X-Ray Diffraction Photographs compared to that given by Extracted Ribonucleic Acid), 644
Klug, Harold P., and Brasted, Prof. Robert C.: The Elements and Compounds of Group IVA (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed and Prof. Robert C. Brasted, Vol. 7), review by Dr. K. W. Bagnall, 185
Klyne, Prof. W.: Appointed to the chair of chemistry in Westfield College, London, 361; work of, 361
Knecht, R. W.: Possibility of Detecting Ionospheric Drifts from the Occurrence of Spread *F* Echoes at Low Latitudes, 927
Knight, Dr. R. L., and Keep, Elizabeth: Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey, review by Dr. G. Haskell, 184
Knipling, Dr. E. F., and others: DDT—the Insecticide DDT and its Significance (edited by Paul Muller), Vol. 2, Human and Veterinary Medicine (edited by Dr. S. W. Simmons), review by Prof. D. S. Bertram, 271
Knowledge: The Diffusion of (Dr. Michael Grant), 371
Knowledge of Materials, Association for the Advancement of the, and others: International Congress on the Technology of Plastics Processing, 559

Known Age : Marked Humpback Whale of (Dr. R. G. Chittleborough), 164
Knox, Alice W., and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094

Local Health Service (United Nations, World Health Organization, Report Series No. 194), 465
Local Increase of Intensity of Cosmic Radiation (J.-P. Legrand and A. Helary), 397
Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of Thermal Neutrons—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Localization of a Halogenated Porphyrin in Mouse Tumours (K. I. Altman and Prof. K. Salomon), 1124
Localization (Histochemical), of Human, Term Placental 17β-Œstradiol Dehydrogenases—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Localization (Intracellular), of Enzymes (Centre Inter-Universitaire de Recherches Enzymologiques Colloquium on), 836
Localize Antigen by Electron Microscopy : Use of Ferritin-conjugated Antibody to (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094
Localized Ultra-violet Irradiation : Influence of, on the Incorporation of Adenine-8-^{14}C and DL-Methionine-^{35}S in *Acetabularia mediterranea* (Prof. J. Brachet and Dr. M. J. Olszewska), 954
Lock, J. A., and others : Translocation of Wild Animals as a Means of Game Control, 518
Lodge, Dr. G. A. : Experiments on the Nutrition of Sows, 115
Lofts, Dr. B., and Boswell, C. : Cyclical Changes in the Distribution of the Testis Lipids in the Common Frog, *Rana temporaria*, 708
Lofts, Dr. B., and others : Effects of Whole-body Irradiation on the Breeding Plumage of the Weaver Finch, *Quelea quelea*, 615
Logan, J. K., and others : The Helium-4 Scale of Temperature, 1077
Logemann, Dr. W., and others : Antileukaemic Activity of Glycyrrhetinic Acid, 607
Logic (Symbolic), and its Applications : Introduction to (Rudolf Carnap), translated by William H. Meyer and John Wilkinson, *review* by F. I. G. Rawlins, 729
Logic, Methodology and Philosophy of Science (International Union for History and Philosophy of Science International Congress for), 201
Lollar, Robert M., and others (edited by) : The Chemistry and Technology of Leather, Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
London : Protection against Tidal Flooding in (N. B. Webber), 293
London Hospital Medical School : Appointment of Dr. I. Doniach to the chair of morbid anatomy, 466
London Research Foundation : Grant of £56,000 to Queen Elizabeth College, London, to further the research work of the Department of Nutrition with special reference to its work on fertility control, 201
London School of Hygiene and Tropical Medicine : Appointment of Prof. E. T. C. Spooner as dean, 466
Long Island Sound : Oceanography of (Gordon A. Riley, Eugene Harris, Henry M. Schurr, P. T. Wangersky, Sarah W. Richards and R. Wade Covill) ; Guide for Preparing Figures (Y. H. Olsen and James E. Morrow, Jr.), 123
Longfield, Cynthia, and others : Dragonflies, *review* by Dr. D. E. Kimmins, 631
Longitude Effect in Temperate Zone Sporadic *E* and the Earth's Magnetic Field (L. H. Heisler and Dr. J. D. Whitehead), 676
Longosomidae : The Polychaete Family, in New Zealand (Prof. G. A. Knox), 1131
Longuet-Higgins, Prof. H. C. : Quantum Chemistry, *review*, 541
Lorenzini : Electrical Sensitivity of the Ampullae of (Dr. R. W. Murray), 957
Lotaustralin in White Clover : Biosynthesis of Linamarin and (G. W. Butler and Beris G. Butler), 780
Lovell, Prof. A. C. B. : Grant of £2,500 for Space Research (for the tracking of satellites and space probes), 744
Lovelock, Dr. J. E. : An Ionization Detector for Permanent Gases, 49
Low, Kerstin, and Edvarson, K. : Content of Caesium-137 and (Zirconium + Niobium)-95 in Swedish Soils, 736
Low, William : Paramagnetic Resonance in Solids (Solid State Physics—Advances in Research and Applications, Supplement 2), *review* by Dr. R. O. Davies, 886
Low-Frequency (Very) Hiss observed at Byrd Station, Antarctica : Association between Aurorae and (Dr. L. H. Martin, Dr. R. A. Helliwell and K. R. Marks), 751
Low-Grade Mental Deficiency in a Large Swedish Rural Population : A Clinical and Genetico-Statistical Study of Schizophrenia and (Bertil Hallgren and Torsten Sjogren), 298
Low Latitudes : Possibility of Detecting Ionospheric Drifts from the Occurrence of Spread *F* Echoes at (R. W. Knecht), 927
Low-priced Books for Overseas, 741
Low Temperature : The Second Virial Coefficient of Methane at (G. Thomaes and R. Van Steenwinkel), 229
Low-Temperature Fuel Cell (Shell Research Centre), 994

Low Temperatures : Thermal Expansion at (Guy K. White), 927
Low Temperatures (Extremely) : Survival of Woody Plants at (Johnson Parker), 1133 ; (Dr. Akira Sakai), 1134
Lowell Technological Institute Research Foundation (Geophysics Research Directorate of the United States Air Force Cambridge Research Center, with the co-operation of) : Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959 (edited by William G. Chace and Howard K. Moore), *review* by Dr. B. A. Thrush, 726
Lowenstein, Dr. John M. : Synergism of Bivalent Metal Ions in Transphosphorylation, 570
Lower Atmosphere : Turbulent Transfer in the (Dr. C. H. B. Priestley), *review* by Prof. P. A. Sheppard, 974
Lower Molecular Weight : Determination of Fatty Acids of, by Gas Chromatography (Marie L. Vorbeck, Leonard R. Mattick, Frank A. Lee and Carl S. Pederson), 689
Lowther, R. L., and Boll, W. G. : Ethionine and Plant Growth Systems, 831
Lugli, A. M., and others : An Antibiotic Complex derived from a *Streptomyces* and Active against Gram-positive Bacteria, 1029
Luke, Sir Harry : Continuity in a Small Pacific Island, *review*, 816
Lumbricus terrestris (Annelid) : Biosynthesis of Squalene by the (Joyce M. Wootton and Lemuel D. Wright), 1027
Lund University Expedition in 1950-1951 : Results of the, Vol. 6, South African Animal Life (edited by Bertil Hanstrom, Per Brinck and Gustav Rudebeck), *review* by H. Oldroyd, 1063
Lung : Epidemiology of Cancer of the (United Nations, World Health Organization, Technical Report Series No. 192), 115
Lunt, Ramona B., and others : Transformation of Resistance to 8-Azaguanine in *Diplococcus pneumoniae*, 800
Lusena, Dr. C. V. : Freezing and Drying of Biological Materials, 749
Luyet, Prof. B. : Freezing and Drying of Biological Materials, 748
Lymph and Blood of Sheep infected experimentally with the Virus of Tick-borne Encephalitis : Virus and Antibodies in the (Doubravka Málková), 716
Lynam, F. C. : The Development of Pulp and Particle Board Industries and their Effect on Forest Management (The Development of the Chipboard Industry), 33
Lynen, F. : Intracellular Localization of Enzymes, 853
Lyon, Dr. A. J., and others : Equatorial Spread-*F* and *F*-Layer Heights, 1086
Lyophilization (Association des Cours Internationaux de Lyophilization second International Course on), 29
Lyotropic Series : Effect of the Cations of the, on the Tension of Vascular Muscle (Prof. L. Laszt), 329
Lysergic Acid Derivatives : Production of, by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Lysergic Acid Diethylamide : Effect of, on Larval Growth (Dr. D. V. Siva Sankar, Arthur Kopelman, Peter Schilder and Eleanor Gold), 153
Lyttleton, Dr. J. W. : Stabilization by Manganous Ions of Ribosomes from Embryonic Plant Tissue, 1026

MAČAN, Dr. T. T. : North American Fresh-Water Biology, *review*, 6
McAuliffe, Dr. D. J. : Appointed lecturer in ophthalmology at the University of Edinburgh, 465
McBurney, Dr. C. B. M. : The Stone Age in Northern Africa, *review* by M. C. Burkitt, 1062
Maccabaean Prize and Medal for an essay on a subject connected with the History of Medicine or Pharmacy (Worshipful Society of Apothecaries of London), 650
Maccabaeans, Society of : Award of the Meldola Medal for 1961, 743
MacCabe, J. R. : *Obituary*, 23
McCarrison, Sir Robert : *Obituary* by Dr. H. M. Sinclair, 195
McCartney, J. T., and others : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal, 1014
McConkey, E. A. G., and others : Gamma Irradiation of Lead Silicate Glass, 135.
McCrea, Prof. W. H. : Astrophysics of Non-Static Systems, *review*, 538
  Interpretation of Cosmology, 583
MacDermot, Violet : The Muscular Disease Myasthenia gravis, 28
Macdonald, A. M. G. : Colorimetric Analysis, *review*, 3
MacDonald, Dr. D. K. C. : Self-Regulation in Living Systems—Tremor, 297
McDonald, Dr. Ian W. : The Ian Clunies Ross Animal Research Laboratory, Prospect, New South Wales, 980
Macdonald, Dr. J. A. : Appointed professor of botany at the University of St. Andrews, 1075 ; work of, 1075
Macdonald, W. J. P., and others : Ocean Currents in McMurdo Sound, 867
MacDowall, J. : Distribution of Atmospheric Ozone—a Preliminary Analysis of some International Geophysical Year Observations, 382
McGee, Prof. J. D. : Grant of £1,000 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of a television system for X-ray image intensification, 291
McGivering, I., and others : Management in Britain—a General Characterization, 537
McGrath, M. M. : Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Botany), 742
MacGregor, J. J. : Scope for Expanding Pulp and Board Industries in Britain, 32
Mach Number (High), Air-breathing Engines (AGARD fourth Colloquium on Combustion and Propulsion), 18
MacKeand, J., and others : Translocation of Wild Animals as a Means of Game Control, 518
McKenna, Susan M. O., and others : The Solar Flare of June 1, 1960, 926
Mackenzie, Dr. D. W. R. : Appointed to a lectureship in microbiology at the Queen's University, Belfast, 117
Mackinnon Research Studentship awarded by the Royal Society to Dr. D. T. Edmonds, 291
McLafferty, G. H. : Combustion and Propulsion—High Mach Number Air-breathing Engines (Basic Studies on Air Intakes), 20
McLaren, Dr. Anne, and Michie, Dr. Donald : Control of Pre-Natal Growth in Mammals, 363
McLennan, Prof. H. : Given an Award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 291
McMurdo Sound : Ocean Currents in (A. E. Gilmour, W. J. P. Macdonald and F. G. Van der Hoeven), 867
MacNaughton, Dr. F. L. : Self-Regulation in Living Systems (Tremor—'Clonus', Alternating Contractions and Relaxations of Muscle), 297
MacNeill, B. H., and Ismen, Hikmet : Virus-Streak Disease of Tomatoes, 903
McNicol, Dr. R. W. E. (Thomas, Prof. J. A., and) : A Highly Directive Rotating Array for 16 Mc./s., 398
MacNutt, Mary M. (von Maltzahn, Prof. Kraft E., and) : Intracellular Configuration and Dedifferentiation in *Splachnum ampullaceum* (L.) Hedw., 344
McQuillen, Dr. K. : Cytoplasmic Particles and their Role in Protein Synthesis (Time Relationships during Protein Synthesis in *Escherichia coli*), 644
Macrae, W. D. : Tuberculosis in Animals (Eradication of Tuberculosis from Cattle), 998
Macromolecules (Biological) : Ultracentrifugation of (Colloid and Biophysics Committee of the Faraday Society Discussion on), 905
Macroscopic Swelling of Vermiculite Crystals in Water (G. F. Walker), 312
Madness : The Divided Self—a Study of Sanity and (Dr. R. D. Laing), *review* by Dr. Clifford Allen, 1062
Madréporaires Fossiles : Contribution à la Systématique des (James Alloiteau), *review* by Dr. H. Dighton Thomas, 95
Magalhaes, L. E., and others : Race Differences in the Ability to excrete Beetroot Pigment (Betanin), 806
Magill, J. H. : A New Technique for Following Rapid Rates of Crystallization, 770
Magnetic Field (Earth's) : Longitude Effect in Temperate Zone Sporadic *E* and the (L. H. Heisler and Dr. J. D. Whitehead), 676
Magnetic Field (Electric and) : Michael Faraday and the Evolution of the Concept of the (Prof. L. Pearce Williams), 730
Magnetic Field (Galactic) : A New Limit to the, set by Measurements of the Zeeman Splitting of the Hydrogen Line (Dr. R. D. Davies, C. H. Slater, W. L. H. Shuter and P. A. T. Wild), 1088
Magnetic Field Fluctuations (Periodic), in the Sceptre Discharge (Dr. N. L. Allen), 279
Magnetic Fields in Chromospheric Flares : Measurement of (M. Blaha, M. Kopecky and Z. Svestka), 224
Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks : Comparison of the Chemical Composition and (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Magnetic Resonance : Nuclear, *review* by Dr. L. M. Jackman, 358
  High-resolution Nuclear (J. A. Pople, W. G. Schneider and H. J. Bernstein), *review* by Dr. L. M. Jackman, 358
Magnetic Resonance Spectroscopy (Proton) : Structure Determination with the Help of (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely, Dr. R. F. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Magnetization of Sediment Cores from the Eastern Atlantic Ocean (M. J. Keen), 220
Magnetization (Stress-Dependent), in some Quartz-Dolerites (Dr. D. W. Powell), 225
Magneto-Ionic Theory and its Applications to the Ionosphere (J. A. Ratcliffe), *review* by Sir Harrie Massey, 810
Magnitude' : 'Dex' or 'Order of ? (Prof. J. B. S. Haldane), 879
Magnusson, Bengt (Brosset, Prof. Cyrill, and) : The Silicon—Boron System, 54
Mahon, Dr. J. : Parasites as Enemies and Allies, 203
Maier-Leibnitz, H. : At the Tenth General Physics Conference of the Swedish National Committee for Physics (Research Programme of the Munich Reactor), 557
Maiman, Dr. T. H. : Stimulated Optical Radiation in Ruby, 493
Maintenance of Rumen Oligotrich Protozoa : Effect of Penicillin on the (G. S. Coleman), 518
Maintenance of Shape of the Human Red Cells : Adenosine Triphosphate and (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Martland, B. J. G. : Birds in Colour, *review*, 273
  The Second BBC Naturalist, *review*, 728
Majer, Dr. J. R. : Appointed lecturer in chemistry at the University of Birmingham, 117
Majer, Dr. J. R., and others : Cage Effect in the Liquid-Phase Photolysis of Fluorinated Ketones, 314
Major Element Relationships in Tektites (R. D. Cherry, Dr. S. R. Taylor and Maureen Sachs), 680
Makarov, E. S. : Crystal Chemistry of Simple Compounds of Uranium, Thorium, Plutonium, Neptunium (translated from the Russian by E. B. Uvarov), *review* by Dr. L. E. J. Roberts, 728
Making of the Broads (Dr. J. M. Lambert, J. N. Jennings, C. T. Smith, Charles Green and J. N. Hutchinson), *review* by Miles Burkitt, 636
Malaya : Newly Discovered Rock-Shelter Art in (J. M. Matthews), 373
Male and Female Mice (Resistance of), to Ectromelia : Effect of a Primary Tuberculous Infection on the (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Malhotra, S. K. : Awarded a Senior Studentship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Malik, Dr. C. P. : Effect of Variations in Temperature on Meiosis in *Gagea reticulata* Schultes, 805
Málková, Doubravka : Virus and Antibodies in the Lymph and Blood of Sheep infected experimentally with the Virus of Tick-borne Encephalitis, 716
Malnutrition : Influence of Different Types of, on the ^{14}C-Lysine Metabolism in Young Rats (Prof. Kurt Schreier and Corinna Kassens), 1117
Mammalian Skin : Phosphate Esters produced by, from 2-Deoxy-D-glucose (Dr. S. A. Brooks, Dr. J. C. Lawrence and Dr. C. R. Ricketts), 1028
Mammalian Tissues : The β-D-Fucosidase Activity of, and its relation to other Glycosidases (Dr. G. A. Levvy), 1027
Mammals : Control of Pre-Natal Growth in (Dr. Anne McLaren and Dr. Donald Michie), 363
  Potentiation of Contractility in the Heart Muscle of the Rat and some other (Dr. V. Kruta and Dr. P. Braveny), 327
  Serum Iron and Total Iron-binding Capacity in certain (Prof. Jose Planas and Saunio de Castro), 1126

Mammals (Marine): Laminated Structure of Bones from some (Dr. R. M. Laws), 338
Man: Absence of Local Cytotoxic Change in, Griseofulvin (Prof. Leon Goldman, Amanda Beyer and Jan Schwarz), 335
  Cytology and Cell Culture Genetics of (Symposium published by the *American Journal of Human Genetics*), 116
  The Future of (Prof. P. B. Medawar), *review* by Dr. J. D. Nisbet, 446
  Mechanisms of Meiotic Non-disjunction in (John S. S. Stewart), 804; (Dr. Curt Stern), 805
  Nature and (John Hillaby), *review* by T. H. Hawkins, 979
Man, Research Institute for the Study of (Division of Anthropology of the New York Academy of Sciences and the): Conference on Culture, Society and Health, 658
Man's Technological Progress from Steam Engine to Satellite: Science as History—the Story of (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J. L. Stollery, 8
Man's (A Plain) Guide to Atomic Energy (P. J. Duncton), 1076
Man (Prehistoric), in Europe (Frank C. Hibben), *review* by Miles Burkitt, 729
Man, Horse, Sheep and Dog: Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in comparison with (Dr. C. J. G. van der Horst), 146
Man-made Fibres, *review* by Prof. C. S. Whewell, 2
Man-Made Textile Encyclopedia (edited by J. J. Press), *review* by Prof. C. S. Whewell, 2
Man-Power: Flight by (Dr. E. Guerra and Dr. B. Gunther), 419
Manpower Problems (Trained): The Public Service in New States—a Study in some (Kenneth Younger), 971
Management: Cybernetics and (Stafford Beer), *review* by J. A. Easterbrook, 269
Management in Britain—a General Characterization (I. McGivering, D. G. J. Matthews and W. H. Scott), 537
Management in the Industrial World—an International Analysis (Frederick Harbison and Charles S. Myers), 537
Management, British Institute of (South London Committee): Conference on Research Necessary for the Preparation and Use of Case Studies. 660
Management (Forest): The Development of Pulp and Particle Board Industries and their Effect on (Society of Foresters of Great Britain Discussion on), 32
Management and Technology, 537
Managerial Resources—an International Survey, 535
Manchester College of Science and Technology. Summer School in Modern Methods of Crystal Structure Determination, 201
  Course of lectures on Problems of Radioactivity at Water and Sewage Works, 743
Mandelstam, Dr. Stanley: Appointed to a new chair of mathematical physics in the University of Birmingham, 117, 197; work of, 197
Mandryk, M., and others: Differentiation in *Peronospora tabacina* Adam., 710
Manganous Ions: Stabilization by, of Ribosomes from Embryonic Plant Tissue (Dr. J. W. Lyttleton), 1026
Mangelsdorf, Jun., Prof. Paul C., and Washington, Elmer L.: Packing of Mixtures of Hard Spheres, 930
Mankiewicz, Dr. E., and Liivak, Dr. M.: Effect of *Candida albicans* on the Evolution of Experimental Tuberculosis, 250
Mann, Jun., L. T., and others: Homotransplant Antigens—Preparation of Active Cellular Fractions, 774
Mann, Dr. Monica (Butterworth, Dr. K. R., and): Proportion of Noradrenaline to Adrenaline in the Adrenal Glands of Litter-mate Cats, 785
Manot, Prof. M.-M. (Mathieu, Prof. J.-P., and): Tables of Constants and Numerical Data, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids, *review* by Dr. J. Walker, 7
Mansell, Dr. A. L. (Barrett, Dr. Jack, and): Ultra-Violet Absorption Spectra of the Molecules H_2O, HDO and D_2O, 138
Mansfeld, Prof. Rudolf: Elected a member of the Botany section of the Leopoldina Academy of Natural Sciences, 1079
Manton, Dr. S. M. (Saunders, J. T., and): A Manual of Practical Vertebrate Morphology, third edition, *review* by Dr. N. B. Marshall, 9
Manual of Mathematical Physics (Paul L. Richards), *review* by Prof. R. Eisenchitz, 445
Marini, Giovanni, and others: Proliferative Capacity of Acute Leukaemia Cells, 611
Marangoni Effects: The (L. E. Scriven and C. V. Sternling), 186
Marconi's Research and Development Laboratories: Appointment of G. D. Speake as deputy chief of research, 290
Marine Animals: The Biology of (Dr. J. A. Colin Nicol), *review* by Prof. C. M. Yonge, 630
  Physiology of, *review* by Prof. C. M. Yonge, 630
Marine Biological Reports from Denmark, *review* by Dr. A. J. Southward, 360
Marine Gastropoda: 'Water Rigour' as an Aid when Operating on (Prof. B. J. Krijgsman and A. C. Brown), 69
Marine Mammals: Laminated Structure of Bones from some (Dr. R. M. Laws), 338
Marine Physics: Studies in, *review* by Dr. G. E. R. Deacon, 183
Marine Plankton: Abundance of (R. M. Cassie), 289
Markakis, Prof. P.: Zone Electrophoresis of Anthocyanins, 1092
Marked Humpback Whale of Known Age (Dr. R. G. Chittleborough), 164
Markov, Dr. K. L., and others: Adaptive Chain in the Conversion of Anti-metabolites into Metabolites, 1041
Markov, K. K., and others: Work of the Antarctic Expeditions of the Academy of Sciences of the U.S.S.R., 287
Markowitz, A. S., and others: Immunological Relationships between the Rat Glomerulus and Nephritogenic Streptococci, 1095
Marks, K. R., and others: Association between Aurorae and Very Low-Frequency Hiss observed at Byrd Station, Antarctica, 751
Marks, Dr. V., and Smith, Dr. M. J. H.: Anti-Inflammatory Activity of Salicylate, 610
Marr, J. D. (Ward, Dr. A. H., and): Radioactive Fall-out in Ghana, 299
Marrow Cells (Bone): Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and (Dennis Quaglino and Dr. F. G. J. Hayhoe), 85
Marrow Cells (Transplanted Bone), in Radiation Chimaeras: Identification of (P. Czerski, O. Rosiek and J. Sabliński), 955
Marrow (Bone) Depression in Murine Leukaemia (James T. Duhig), 71
Marsden, Sir Ernest: Radioactivity of Soils, Plants and Bones, 192
Marshall, Prof. A. J.: The Land of the Marsupials, *review*, 543
Marshall, Prof. A. J., and others: Effects of Whole-body Irradiation on the Breeding Plumage of the Weaver Finch, *Quelea quelea*, 615
Marshall, L. (Landovitz, L. F., and): Gravitational Red Shift of Hydrogen 21-cm. Radiation as a Method to measure Galactic Gravitational Potential, 223
Marshall, Dr. L. H., and Hanna, C. H.: Dextran and Insulin in Rats, 1118
Marshall, Dr. N. B.: A Manual of Practical Vertebrate Morphology, *review*, 9
  The Galathea Expedition, *review*, 443
Marshall, T. G., and others: Diamagnetic Moment of Gaseous Plasmas measured by Spin Resonance Techniques, 584
Marshall Chair of the Physiology of Reproduction, Cambridge, 113
Marsupials: The Land of the, *review* by Prof. A. J. Marshall, 543
Martensite: Retained Austenite and the Tempering of (S. Matas and Prof. R. F. Hehemann), 685
Martin, A. J., and others: An Improvement in the Ductility of Beryllium at High Temperatures, 494
Martin, E. M.: Cytoplasmic Particles and their Role in Protein Synthesis (Role of Ribonucleic Acid in Protein Synthesis), 644
Martin, Dr. F. M.: Appointed lecturer in public health and social medicine at the University of Edinburgh, 465
Martin, Dr. L. H.: Observations of 'Whistlers' and 'Chorus' at the South Pole, 1018
Martin, Dr. L. H., and others: Association between Aurorae and Very Low-Frequency Hiss observed at Byrd Station, Antarctica, 751
Martin, W. B., and others: New Inhibitor of Monoamine Oxidase, 941
Masks of God: The—Primitive Mythology (Dr. Joseph Campbell), *review* by Dr. K. O. L. Burridge, 7
Masri, M. S., and others. Excretion of Catechol after Ingestion of Quinic and Shikimic Acids, 691
Mass, Length and Time, *review* by G. R. Noakes, 183
  An Introduction to the Physics of (Prof. Norman Feather), *review* by G. R. Noakes, 183
Mass Spectra (Carbon Dioxide): High-Energy Oxygen Ions in (R. M. S. Hall), 683
Mass Spectrometric Investigation of the Vaporization of Sulphides and the Dissociation Energy of S_2 (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Mass Spectrometry (Solid-Source), using Negative Ions: Isotopic Analysis of Silicon by (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Massachusetts Institute of Technology: Seminar Lectures on the Physiological Role of Fast Transfer Reactions, 904
Massey, Sir Harrie: Ionospheric Propagation of Electromagnetic Waves, *review*, 810
  Collisions (Forty-third Guthrie Lecture of the Physical Society), 853
Mast Cells and 5-Hydroxytryptamine in Precancerous Mouse Skin (Dr. R. E. Coupland and Dr. J. F. Riley), 1128
Matas, S., and Hehemann, Prof. R. F.: Retained Austenite and the Tempering of Martensite, 685
Mateles, Dr. Richard I.: Ferricyanide Reduction Method for Reducing Sugars, 241
Material with Proactivator Activity: Isolation of, from Human Serum (H. B. W. Greig and Elise M. Cornelius), 1125
Material (Air-borne): Radioactive Labelling of Membrane Filters for the Assay of (Dr. G. Kuble and Dr. K. Spurny), 930
Material (Living): The Effects of Pollution on (edited by W. B. Yapp), *review* by Dr. G. C. Ware, 1061
Material (Reference): Guide to (edited by Dr. A. J. Walford, with the assistance of L. M. Payne), *review* by R. Brightman, 273
Materials. Non-destructive Testing of (British Council Course on), 1079
Materials, Association for the Advancement of the Knowledge of, and others: International Congress on the Technology of Plastics Processing, 559
Materials (Biological): Freezing and Drying of (Dr. Harold T. Meryman, and 12 other Authors), 748
Materials (Botanical): Alpha Activity of certain (Prof. W. V. Mayneord, R. C. Turner and J. M. Radley), 208
Materials Research and Development for National Security: More Effective Organization and Administration of (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Maternal Inheritance and Interspecific Hybrids of the Liverwort *Sphaerocarpos* (Dr. William T. Doyle), 429
Mathematical Association: To award a Diploma in Mathematics, 114
Mathematical Physics at Birmingham, 197
Mathematical Physics: Manual of (Paul I. Richards), *review* by Prof. R. Eisenschitz, 445
Mathematics at Oxford, 830
Mathematics: The Diploma in (Mathematical Association), 114
Mathematics (Applied), at Bangor, 197
Mather, Prof. Kenneth: Genetics of Continuous Variation, *review*, 813
Mather, R. L., and others: Fractionation of Nuclear Weapon Debris, 1100
Mathias, Dr. A. P., and others: Activity of Bovine Pancreatic Ribonuclease A in Mixed Solvent Systems, 601
Mathieson, Dr. A. McL.: The Chemistry of Natural Products (The Direct Determination of the Molecular Structure of Natural Products), 1080
Mathieu, Prof. J.-P., and Manot, Prof. M.-M.: Tables of Constants and Numerical Data, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids, *review* by Dr. J. Walker, 7
Matkovics, Dr. Béla (Fehér, Dr. T., and): Chemical Constitution of the Red Blood Cell Membrane, 701
Matrix (Organic), of Tooth Enamel (J. E. Eastoe), 411
Matrix Antifouling Compositions: Mode of Action of Soluble (A. Partington), 1105
Matsumoto, M., and others: Distribution of Protein-bound Aminoazo Dyes in the Rat Liver Microsome, 943
Matter: Penetration of Charged Particles in—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (edited by A. Vehling), (United States National Academy of Sciences—National Research Council, Nuclear Science Series, Report No. 29), 1086
Matthews, D. G. J., and others: Management in Britain—a General Characterization, 537
Matthews, J. M.: Newly Discovered Rock-Shelter Art in Malaya, 373

Mattick, Leonard R., and others: Determination of Fatty Acids of Lower Molecular Weight by Gas Chromatography, 689
Maturation (Ovarian). Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a Pregnant Rabbit for (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Matzke, Jorgen: Effect of Testicular Hyaluronidase on the Permeability of Human Arterial Tissue, 873
Maxwell, Capt. L. R.: Cost of Scientific Periodical Publications, 1052
Maxwell, Dr. R. W.: Appointed a senior lecturer in engineering at the University of Leicester, 743
May, B. R., and Smith, D. E.: Final Months and Descent of Satellite *Sputnik* 3, 456
  The Sudden Discontinuity in the Orbital Period of *Sputnik* 4 Satellite, 866
Mayes, Dr. P. A.: An Inverse Relation between the Liver Glycogen and the Blood Glucose in the Rat adapted to a Fat Diet, 325
Mayneord, Prof. W. V., and others. Alpha Activity of certain Botanical Materials, 208
Mazumdar, B. K., and others: Initial Stages of Oxidation of Coal, 502
Mazur, Dr. P.: Freezing and Drying of Biological Materials, 749
Mead-Briggs, A. R., and Rudge, A. J. B.: Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation, 1136
'Meaning': The Relativity of (Dr. W. Ross Ashby), 532
Means of Game Control. Translocation of Wild Animals as a (Dr. A. M. Harthoorn, J. A. Lock and J. MacKeand), 518
Means (Possible), of Predicting the Nitrogen-supplying Power of Soils: Ammonia released on Treating Soils with *N* Sodium Hydroxide as a (A. H. Cornfield), 260
Means (Two): Significance of the Difference between, when the Population Variances may be Unequal (John B. de V. Weir), 438
Measurement of Grassland Productivity—Proceedings of the University of Nottingham Sixth Easter School in Agricultural Science, 1959 (edited by Prof. J. D. Ivins), *review* by Dr. G. W. Cooke, 544
Measurement of Magnetic Fields in Chromospheric Flares (M. Blaha, M. Kopecky and Z. Svestka), 224
Measurement of Slip (*Ko*) and Viscous (*Bo*) Flow Coefficients of Permeable Solids (J. G. Biram), 865
Measurement (Electrostatic), of the Geoelectric Effect in Coleoptiles (Carl Hellmuth Hertz), 320
Measurement (Flow), in Closed Conduits (National Engineering Laboratory Symposium on), 905
Measurement (Routine), of Particle Shape Factors in the Sieve Range: A Method for the (Dr. Colin C. Harris), 401; (D. Howitt), 403
Measurement (Simultaneous), of Adsorption and Electrodekinetic Parameters at Metal Surfaces (A. M. Peers), 503; (Dr. E. A. Blomgren and Dr. J. O'M. Bockris), 504
Measurements of the Zeeman Splitting of the Hydrogen Line: A New Limit to the Galactic Magnetic Field set by (Dr. R. D. Davies, C. H. Slater, W. L. H. Shuter and P. A. T. Wild), 1088
Measurements (Airborne), of Latitudinal Variation of Frost-point Temperature and Wind (N. C. Helliwell), 993
Measurements (Gamma-Ray). Fall-out Caesium in Surface Sea Water off the California Coast (1959–60) by (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Measurements (Reflectance). Use of, in assessing the Colour Changes of Ageing Bloodstains (Dr. D. Patterson), 688
Measurements (Instruments and) Conference and Exhibition. Fifth International (Royal Swedish Academy of Engineering Sciences and the Swedish Association of Technical Physicists), 374
Measuring the Size of Isolated Cells (Dr. Samuel S. Epstein and Jacqueline B. Weiss), 461
Measuring Instruments. Chemical Plant Instrumentation—some Notes on the Use of (Association of British Chemical Manufacturers), 1079
Meat. Science and, *review* by Prof. J. Hawthorn, 888
Meat Diet: Lack of Haematopoietic Potency of Liver of Mice fed on a (Judith Ilan and Prof. K. Guggenheim), 698
Meat Institute Foundation (American), (Members of the Research Staff of the). The Science of Meat and Meat Products, *review* by Prof. J. Hawthorn, 888
Meat-Products. The Science of Meat and (Members of the Research Staff of the American Meat Institute Foundation), *review* by Prof. J. Hawthorn, 888
Meat and Meat Products: The Science of (Members of the Research Staff of the American Meat Institute Foundation), *review* by Prof. J. Hawthorn, 888
Mechanical Engineering at Cardiff, 555
Mechanical Forces: Initiation of Chemical Reactions by (Dr. Robert Schnurmann and Ivor S. Stringer), 587
Mechanics: Statistical (with special reference to Irreversibility), (Institute of Physics and the Physical Society Conference on), 1079
Mechanics (Applied): Tenth International Congress of, 201
Mechanics (Experimental): International Congress on, 559
Mechanism: Kinetics and (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely and Dr. A. Wassermann), 662
Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde (Dr. Thomas Alderson), 485
Mechanism of the Physiological Action of Rotenone (Prof. P. E. Lindahl and K. E. Öberg), 784
Mechanism of Starch Biosynthesis (Dr. Maria A. Rongine de Fekete, Dr. Luis F. Leloir and Dr. Carlos E. Cardini), 918
Mechanism (A Second), of Inhibition at the Crayfish Neuromuscular Junction (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 247
Mechanisms: Detoxication (Prof. R. Tecwyn Williams), second edition, *review* by Prof. E. Boyland, 94
Mechanisms of Meiotic Non-disjunction in Man (John S. S. Stewart), 804; (Dr. Curt Stern), 805
Mechanisms (Adrenergic): Parallelism of Changes produced by Cooling and by Drugs known to affect (Prof. Eleanor Zaimis), 213
Medal of the Iron and Steel Institute, 286
  First Award made to the Royal Society, 286
Medawar, Prof. P. B.: Appointed director of the National Institute for Medical Research, 374, 991; work of, 991
  The Future of Man, *review* by Dr. J. D. Nisbet, 446
Media (Gaseous): Evaporation and Droplet Growth in (N. A. Fuchs), translated from the Russian by J. M. Pratt, edited by Dr. R. S. Bradley, *review* by Prof. F. H. Garner, 451
Media (Physiological), for Tissues of *Helix* (C. K. Goddard), 68
Medial Temporal Lesions: Effects of, on Taste Preference in the Monkey (Dr. L. Weiskrantz), 879
Mediation of the Mutagenic Activity of Formaldehyde: Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the (Dr. Thomas Alderson), 485
Medical Helminthology (Dr. J. M. Watson), *review* by Dr. G. Lapage, 815
Medical Research in the Paris Hospitals, 26
Medical Research, National Institute for: Appointment of Prof. P. B. Medawar as director, 374, 991
Medical Research Council. Neuropsychiatric Research Unit transferred from the Whitchurch Hospital, Cardiff, to the Council's Laboratories at Carshalton, 466
Medical Sciences (General). Highlights of Research Progress in, 1959 (United States Department of Health, Education and Welfare, Publication No. 739), 200
Medical and Veterinary Zoology: Index-Catalogue of (United States Department of Agriculture), Supplements 9 and 10, 559
Medicine: Human and Veterinary (Dr. W. J. Hayes, Jr., Dr. S. W. Simmons and Dr. E. F. Knipling), (edited by Dr. S. W. Simmons), (DDT—the Insecticide DDT and its Significance, edited by Paul Muller, Vol. 2), *review* by Prof. D. S. Bertram, 271
  Travelling Fellowships in, 994
  The Wish to Fall Ill—a Study of Psychoanalysis and (Dr. Karin Stephen), *review* by Dr. Clifford Allen, 978
Medicine as a Social Science, *review* by Prof. E. Maurice Backett, 633
Medicine, Royal Society of, and others. First British Congress on the History of Medicine and Pharmacy, 374
Medicine or Pharmacy. Maccabaean Prize and Medal for an essay on a subject connected with the History of (Worshipful Society of Apothecaries of London), 650
Medicine and Pharmacy: History of (Faculty of the History of Medicine and Pharmacy of the Worshipful Society of Apothecaries of London, in co-operation with the Royal College of Physicians, the Royal College of Surgeons of England and the Royal Society of Medicine First British Congress on), 374
Medina, Dan (Sachs, Dr. Leo, and): Polyoma Virus Mutant with a Reduction in Tumour Formation, 715
Medium: Influence of the Ionic Strength of the, on the Anaphylactic Sensitization of Isolated Tissues *in vitro* (R. Binaghi, M. Liacopoulos-Bruit, Dr. B. N. Halpern and P. Liacopoulos), 697
Medulla (Denervated Adrenal), of the Rat: Effect of Reserpine on the Nucleotide and Catecholamine Content of the (Prof. Nils-Åke Hillarp), 1032
Mee, C. H. B.: Appointed assistant lecturer in physics at the University of Southampton, 290
Mehta, D. J., and others. Diuretic Activity of 2-Amino-4-meta-chloro-anilino-1,3,5,triazine (*R*-37), 1034
Meier, Jurg, and others. 'Enthalpy Titrations' and Thermochemistry in Molten Salts, 318
Meiosis in *Gagea reticulata* Schultes: Effect of Variations in Temperature on (Dr. C. P. Malik), 805
Meiotic Non-disjunction in Man: Mechanisms of (John S. S. Stewart), 804; (Dr. Curt Stern), 805
Melanin Granules and Mitochondria (Dr. Ruth V. Baker, M. S. C. Birbeck, Dr. H. Blaschko, Prof. T. B. Fitzpatrick and Dr. M. Seiji), 392
Melanocyte-stimulating Component in the Dorsal Skin Secretion of *Xenopus laevis*: Serotonin, a (Dr. F. C. G. van de Veerdonk), 948
Meldola Medal for 1961 of the Society of Maccabaeans, 743
Meleka, Dr. A. H., and Barr, W.: A Possible Origin of Exo-Electron Emission in Plastically Deformed Metals, 232
Mellanby, Dr. Kenneth: Nigeria's Feeding-Stuffs, *review*, 637
Mellon Institute, Pittsburgh: Conference on Diffraction, 650
  Mellon Institute Research 1959-1960—the Annual Report to the Board of Trustees of the Institute for the Fiscal Year 1959-1960 (Matthew R. Ridgway), 908
Melville, Dr. R.: Australian Native Plants for Home Gardens, *review*, 637
Membrane (Red Blood Cell): Chemical Constitution of the (Dr. T. Fehér and Dr. Béla Matkovics), 701
Membrane Conductance (Decreased): Excitation at the Crayfish Neuromuscular Junction with (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
Membrane Excitability of Calcium-deficient Muscles: Restoration of, by Anodal Polarization (Prof. K. Koketsu and K. Noda), 243
Membrane Filters: Radioactive Labelling of, for the Assay of Air-borne Material (Dr. G. Kubie and Dr. K. Spurny), 930
Membrane Fractions (Mitochondrial): Sodium and Potassium in (Dr. Frank Ulrich), 949
Membrane Potential of the Anterior Byssus Retractor Muscle of *Mytilus edulis* (Dr. D. H. Paul), 1121
Membranes (Pseudocoelomic), of *Ascaris lumbricoides*: Use of Collagenase in the Characterization of (Barbara Dawson), 798
'Memories' for Nuclear Physics (G. W. Hutchinson), 854
Men (British), of Science, a New Series to be published by Nelson, 374
Mendel. Evolutionary Theory after, *review* by Dr. H. Kalmus, 726
Mental Deficiency (Low-Grade), in a Large Swedish Rural Population: A Clinical and Genetico-Statistical Study of Schizophrenia and (Bertil Hallgren and Torsten Sjogren), 298
Meprobamate: Depressing Activity of, on the Reticulo-Endothelial System (Prof. A. Del Vecchio and L. Bolis), 513
Mercaptalbumin: An Ortho Effect influencing Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
6-Mercaptopurine. Effect of, on the Net *In vitro* Gas Production of Sensitive and Resistant *L*1210 Mouse Leukaemia Cells (Dr. H. J. Woodliff), 156
6-Mercaptopurine in Immunological Responsiveness (Dr. John L. Robinson and Dr. Charles L. Christian), 796

Mercer, E. H. (Birbeck, M. S. C., and) : Cytoplasmic Particles and their Role in Protein Synthesis (Electron Microscopy in formulating Hypotheses of some Aspects of Protein Synthesis), 644
Meredith, Dr. D. S. : Banana Fruit-spot ('Speckle') caused by *Deightoniella torulosa* (Syd.) Ell., 961
Merino and Polwarth Wools : Abnormal Crimping in (R. E. Chapman, B. F. Short and P. G. Hyland), 960
Meristic Character in Coleoptera : Ovarioles as a (Dr. J. G. Robertson), 526
Merritt, James A., and others : Ultra-violet Absorption Spectra of the Diazines, 500
Meryman, Dr. Harold T. (and 12 other Authors) : Freezing and Drying of Biological Materials, 748
Meso-inositol (^{14}C-), in the Rat : Metabolism of (Dr. D. A. Nixon), 77
π-Mesonic X-Rays : The Method of Observing (Dr. D. West), 853
Messel Medal Address to the Society of Chemical Industry (Viscount Chandos), 831
Metabolic Block (Inborn Error of Metabolism) : Reversibility of an Inherited (Dr. Herman Zondek, Dr. Hannah E. Leszynsky and Dr. Joseph A. Stein), 515
Metabolic Processes : Role of Initial Value of, in Oxygen Consumption Changes in Rats during Irradiation (Dr. A. Vacek), 76
Metabolic Rates at the Cellular Level : Analysis of (Dr. L. G. Lajtha, R. Oliver, R. J. Berry and Elizabeth Hell), 919
Metabolism : Polypeptides of the Human Pituitary with Direct Action on (Dr. J. Bornstein and Deirdre Hyde), 125
    Reversibility of an Inherited Metabolic Block (Inborn Error of (Dr. Herman Zondek, Dr. Hannah E. Leszynsky and Dr. Joseph A. Stein), 515
Metabolism of ^{14}C-Meso-inositol in the Rat (Dr. D. A. Nixon), 77
Metabolism of Oxygen-15 (C. T. Dollery and J. B. West), 1121
Metabolism (Brain) : Isolation and Probable Functions of Betaine Esters in (Prof. E. A. Hosein and Peter Proulx), 321
Metabolism (^{14}C-Lysine), in Young Rats : Influence of Different Types of Malnutrition on the (Prof. Kurt Schreier and Corinna Karassus), 1117
Metabolite (New), of Epinephrine and Norepinephrine in Liver and Kidney : Formation of a (Dr. M. Goldstein and Dr. S. B. Gertner), 147
Metabolites : Adaptive Chain in the Conversion of Antimetabolites into (Dr. K. I. Markov, Dr. G. K. Seev and Dr. E. V. Golovinsky), 1041
Metacorticoid Hypertensive Rats : Electro-shock Seizure Threshold of (Dr. F. M. Sturtevant), 874
Metal : Potentiometric Study of Priming Paints for (Dr. N. R. Bharucha), 756
Metal Ethylenediamine Tetraacetic Acid Chelates : Differential Thermal Analysis of some Transition (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Metal Films (Evaporated) : Hydrocracking of Neopentane and Neohexane over (Dr. J. R. Anderson and B. G. Baker), 937
Metal Ions : Fungitoxicity of (Dr. E. Somers), 427
Metal Ions (Alkali), in Analcite : Energies of Activation for Self-diffusion of (Prof. R. M. Barrer and L. V. C. Rees), 768
Metal Ions (Bivalent), in Transphosphorylation : Synergism of (Dr. John M. Lowenstein), 570
Metal Surfaces : Simultaneous Measurement of Adsorption and Electrode-kinetic Parameters at (A. M. Peers), 503 ; (Dr. E. A. Blomgren and Dr. J. O'M. Bockris), 504
Metallic Corrosion, *review* by Dr. J. M. West, 182
Métallurgie, Société Française de : Meeting on the Heat Treatment of Metals and Alloys, 559
Metallurgists, Institution of : Presidential Address, Effectiveness in Industry (W. E. Bargett), 378
Metals : An Abnormal Serum Protein in Experimental Poisoning by Cadmium and other (D. J. Lawford), 946
    Colorimetric Determination of Traces of (Prof. E. B. Sandell), third edition, *review* by A. M. G. Macdonald, 3
    The Corrosion and Oxidation of (Dr. Ulick R. Evans), *review* by Dr. J. M. West, 182
    The Extraction of, and the Chemistry of Metals (Prof. F. D. Richardson), 466
    The Newer, *review* by Prof. A. G. Quarrell, 725
Metals having a Hexagonal Structure : Work-Hardening and Ductility of Rhenium and their relation to the Behaviours of other (R. A. Jeffery and E. Smith), 52
Metals under Simple Shear : A Simple Method of Investigating the Creep of (Prof. E. N. da C. Andrade), 494
Metals, Institute of : Annual Autumn Meeting, 559
Metals, Institute of (Metal Physics Committee) : The Physical Nature of Plastic Flow (Dr. J. J. Gilman), 374
Metals (Plastically Deformed) : A Possible Origin of Exo-Electron Emission in (Dr. A. H. Meleka and W. Barr), 232
Metals and Alloys : Heat Treatment of (Société Française de Métallurgie Meeting on), 559
Metals and Compounds (Titanium) : Analytical Chemistry of (Maurice Codell), *review* by Prof. A. G. Quarrell, 725
Metarrhizium anisopliae (Metch.) Sor. and *Beauveria bassiana* (Bals.) Vuill. : Pathogenicity of, to Two Species of Elateridae (Dr. R. D. Tinline and R. Y. Zacharuk), 794
Meteorite : The Tunguska (V. N. Rodionov and M. A. Tsikulin), 1077 ; (B. I. Vronsky), 1078 ; (E. L. Krynov), 1078
Meteorites : Fossil (B. I. Vronsky), 648
Meteorites (Iron) : The Sulphide Phase in some (Dr. H. J. Axon), 406
Meteorological Office (Air Ministry) : Geophysical Memoirs No. 102, Average Water Vapour Content of the Air (J. K. Bannon and L. P. Steele), 748
    Scientific Paper No. 1, Airborne Measurements of Latitudinal Variation of Frost-point Temperature and Wind (N. C. Helliwell), 993
Meteorological Organization (International) Prize awarded by the World Meteorological Organization to Prof. J. van Mieghem, 740
Meteorological Organization (World) : International Meteorological Organization Prize awarded to Prof. J. van Mieghem, 740
Meteorological Society (Royal) : L. F. Richardson Prize, 28
    Summer Meeting (Weather Problems in Agriculture), 995
Meteors : Light Curves of (Dr. R. Ananthakrishnan), 675
Methane at Low Temperature : The Second Virial Coefficient of (G. Thomaes and R. Van Steenwinkel), 229
Methionine and Sodium Butyrate (Glucose,) : Reduction of the Intestinal Absorption of, by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
D,L-Methionine-^{35}S in *Acetabularia mediterranea* : Influence of Localized Ultra-violet Irradiation on the Incorporation of Adenine-8-^{14}C and (Prof. J. Brachet and Dr. M. L. Olszewska), 954
DL-Methionine-Ethylester : Damage to Liver Induced by (I. Fehér, F. V. Selmeczi, K. Szalay and Dr. T. Kemény), 421
Method for the Detection of Inhibition of Auxin Transport (B. E. S. Gunning), 428
Method of Estimating Late Larval and Pupal Mortality in the Wild : Radioactive Labelling of Lepidopterous Larvae—a (L. M. Cook and Dr. H. B. D. Kettlewell, 301
Method for the Isolation of Plant Protoplasts and Vacuoles (Dr. E. C. Cocking), 962
Method to Measure Galactic Gravitational Potential : Gravitational Red Shift of Hydrogen 21-cm. Radiation as a (L. F. Landovitz and L. Marshall), 223
Method of Observing π-Mesonic X-Rays (Dr. D. West), 853
Method for the Routine Measurement of Particle Shape Factors in the Sieve Range (Dr. Colin C. Harris), 401 ; (D. Hewitt), 403
Method (Elson and Morgan) : Glucosamine Values of Muramic Acid and other Amino-Sugars by the (R. E. Strange), 38
Method (Ferricyanide Reduction), for Reducing Sugars (Dr. Richard I. Mateles), 241
Method (A New), for the Differential Precipitation of Nucleic Acids from Aqueous Solutions (William G. Aldridge), 323
Method (A New), for the Synthesis of Cyclic Ethers (L. F. Schmoyer and L. C. Case), 592
Method (A Rapid), for Studying Tumour Blood Supply using Lissamine Green (L. N. Owen), 795
Method (A Simple), of Investigating the Creep of Metals under Simple Shear (Prof. E. N. da C. Andrade), 494
Method (A Simple Azo-Dye), for Histochemical Demonstration of Acid Phosphatase (Dr. Tibor Barka), 248
Methodology and Philosophy of Science : Logic, (International Union for History and Philosophy of Science International Congress for), 201
Methods : A Handbook of Colorimetric Chemical Analytical (Tintometer, Ltd.), fifth edition, *review* by A. M. G. Macdonald, 3
Methods (Modern), of Crystal Structure Determination (Manchester College of Science and Technology Summer School in), 201
Methods (Sampling) : Earthworm Population Studies—a Comparison of (F. Raw), 257
Methods (Uniform), of Sugar Analysis, International Commission for—Report of the Proceedings of the Twelfth Session, Washington, D.C., 1958, *review* by Prof. E. L. Hirst, 9
2(o-Methoxyphenoxymethyl)-5-Oxazolidone : Synergetic Action of, on Morphine, Dihydrocodeine and Aminopyrine Analgesia (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), *erratum*, 559
Methyl Acrylate : Generation of Aerosols by Vapour-Phase Polymerization of (R. Pearson and G. Langer), 235
Methylcholanthrene : Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin on Tumours Induced in Mice by (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Metric System : Decimal Coinage and the—Should Britain Change ? (A joint Report of Committees appointed by the British Association for the Advancement of Science and the Association of British Chambers of Commerce), 30
Metropolitan Water Board : Thirty-eighth Report on the Results of the Bacteriological, Chemical and Biological Examination of the London Waters for the Years 1957-1958 (E. Windle Taylor), 468
Meurling, Patrick : Presence of a Pituitary Portal System in Elasmobranchs, 336
Mexico (New) : Anomalous Leads from a Selected Geological Environment in West-Central (William F. Slawson and Carl F. Austin), 400
Mica : Thermal Conduction in, along the Planes of Cleavage (H. J. Goldsmid and A. E. Bowley), 864
Mice : Effect of Hydration on Hexobarbitone-induced Sleep in (Dr. N. K. Bhide), 1030
    Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin in Tumours induced in, by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Mice fed on a Meat Diet : Lack of Haematopoietic Potency of Liver of (Judith Ilan and Prof. K. Guggenheim), 698
Mice treated with Phosphorus-32 : Fertility of (E. A. D. Holmberg, Dr. A. Pavlovsky, C. D. de Pasqualini and S. L. Rabasa), 876
Mice (New-born) : Fate of Homologous Adult Spleen Cells injected into (A. J. S. Davies and Sheila M. A. Doak), 610
Mice (Resistance of Male and Female), to Ectromelia : Effect of a Primary Tuberculous Infection on the (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Mice (Thymectomized) : Recovery of Leukaemogenic Agent from Non-Leukaemic Tissues of (J. F. A. P. Miller), 703
Michie, Dr. Donald (McLaren, Dr. Anne, and) : Control of Pre-Natal Growth in Mammals, 363
Micrasterias americana in Clone Culture : Morphogenetics of (Prof. Paavo Kallio), 164
Microanalytical Separation of Steroids by Gas Chromatography (C. C. Sweeley and Dr. E. C. Horning), 144
Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the Test Organism (Maharani Chakravorty), 239
Microbial Systematics : Discussion on, 190
Microbiological Transformation of Terpenes—Hydroxylation of α-Pinene (P. K. Bhattacharyya, B. R. Prema, B. D. Kulkarni and S. K. Pradhan), 689
Microbiology (General), Society of : Formation of a Microbial Systematics Group, 190
Micrococcal Phosphodiesterase : Mode of Action of (Dr. K. K. Reddi), 74
Microflora (Rhizosphere), of *Camellia sinensis* : Foliar Application of Nutrients and (Dr. C. S. Venkata Ram), 621
Microgram Quantities of Silver : Non-destructive Analysis of, by Radioactivation (Dr. Minoru Okada), 57
125-500 Microns : Pure Rotational Absorption of Ozone in the Region (Dr. H. A. Gebbie, N. W. B. Stone and C. D. Walshaw), 765

Microscope (Electron) Images of Dislocations (Dr. Hatsujiro Hashimoto and Dr. Kazuo Fujita), 51
Microscopy Electron (Nederlandse Vereniging voor Electronenmicroscopie European Regional Conference on), 29
Microscopy (Electron) : Use of Ferritin-conjugated Antibody to Localize Antigen to (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M Rose), 1094
Microscopy (Electron), of Ultra-thin Sections : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by (Miguel Rubio-Huertos and Paul R Desjardins), 1043
Microsome (Rat Liver) . Distribution of Protein-bound Aminoazo Dyes in the (Dr. T. Yamada, M. Matsumoto, S. Kanda and Prof H Terayama), 943
Milcou, Prof S M , and Pavel, S Antigonadotropic Function of the Pineal Gland and the Oxytocin of the Neurosecretory Hypothalamic System, 950
Mild Steel : Correlation of the Alternating Stresses required to Initiate and Propagate a Fatigue Crack in (N E Frost), 233
Miles, Dr. H T . Appointed lecturer in physics at University College, Swansea, 117
Miley, Dr R. A (Rimington, Prof C , and) The Fourth International Goitre Conference, 651
Milieu Cell, Organism and (edited by Prof Dorothea Rudnick), (Seventeenth Symposium of the Society for the Study of Development and Growth), *review* by Dr. E N. Willmer, 450
Milk . Radiostrontium and Radiocaesium in, during 1959 (W Anderson, L K Burton and J O Crookall), 108
Milk after the Reactor Accident at Windscale in October 1957 : The Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Mill, A. G. · Appointed agricultural and food attaché to the British Embassy in Buenos Aires, 1075 ; work of, 1075
Miller, Dr. G L Tantalum and Niobium, *review* by Prof. A. G. Ward, 725
Miller, Dr. Henry : Brain and Behaviour, *review*, 6
Miller, H. C. : International Association for the Protection of Industrial Property, 202
Miller, John A. : Potassium-Argon Ages of some Rocks from the South Atlantic, 1019
Miller, J F A. P : Recovery of Leukaemogenic Agent from Non-Leukaemic Tissues of Thymectomized Mice, 703
Millman, Dr. A. P (Grey, I , and) Spectral Reflectivity of Ore Minerals, 282
Milne, M. K. · Planning for the Changing World Population, *review*, 816
Milobedzki, Prof Tadeusz : *Obituary* by Dr. Wiktor Wawrzyczek, 991
Milstone, Dr J H : Chromatography of Blood Thrombokinase on 'DEAE'-Cellulose, 1127
Milsum, Dr. J. H. · Self-Regulation in Living Systems, 297
Mimetic Twinning in Urea-Ammonium Bromide (C. G. C. Catesby), 765
Mimosa pudica Behaviour of a Threadlike Apparatus in the Petiole of (Dr Hideo Toriyama), 709
Minagawa, S , and others : Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the Horseshoe Crab, 1118
Mind : The Hidden, *review* by Dr. Clifford Allen, 978
Minerals (Clay), Montmorillonite and Vermiculite : Aluminium Interlayers in—Laboratory Synthesis (B. L. Sawhney), 261
Minerals (Epidote) : Stability of (Prof W. S. Fyfe), 497
Minerals (Ore) : Spectral Reflectivity of (I. Grey and Dr. A. P. Millman), 282
Mines (Safety in) Research Establishment Bibliography, 1960 (compiled by E. B. Smith), second edition, *review* by Prof. S. G. Ward, 1063
Mines and Quarries, H.M Inspectors of . Annual Reports for 1959—Scottish Division ; Northumberland and Cumberland Division ; Durham Division , North Eastern Division ; North Western Division ; East Midland Division ; West Midland and Southern Division ; South Western Division, 1076
Mines and Quarries Accidents in, 1076
Mining and Metallurgy, Institution of . Election of A. R O. Williams as president for 1961-62, 994
Minnesota Mining and Manufacturing Co , Ltd. · Appointment of Dr. John D. Kendall as director of European research laboratories, 905
Minor Elements in Soils, *review* by A. H. Debnam, 629
Mirage of Health (Dr. René Dubos), *review* by Prof. E. Maurice Beckett, 633
Missing Link · Adventures with the (Prof. Raymond A. Dart, with Dennis Craig), *review* by Sonia Cole, 888
Mitchell, C. (Bakerman, Dr. S., and) : Infra-red Examination of the Association of Cornea Proteins with Water, 1033
Mitchell, G. F . Pleistocene History of the Irish Sea (Presidential Address to Section C (Geology) of the British Association for the Advancement of Science), 842
Mitchell, Prof. J. C. : Awarded the Rivers Memorial Medal of the Royal Anthropological Institute, 114
Mitochondria : Ageing of (Dr. C. H Gallagher), 162
  Cytochemical Evidence of the Origin of Lipid Bodies (so-called Golgi Bodies) from (H. C. Chopra), 713
  Melanin Granules and (Dr. Ruth V Baker, M. S. C. Birbeck, Dr. H. Blaschko, Prof T. B. Fitzpatrick and Dr. M. Seiji), 392
Mitochondria (Rat Liver) A High-Energy Phosphate Requirement for Succinate Oxidation in Uncoupled (Dr. Giovanni Felice Azzone and Dr Lars Ernster), 65
Mitochondrial Membrane Fractions : Sodium and Potassium in (Dr. Frank Ulrich), 949
Mitochondrial and Cell Water : Phosphoproteins and (Dr. J. D. Judah), 506
Mitosis in Lens Epithelium · Comparison between the Effects of Cysteine and of Anoxia on the Rate of (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Mitsui, Tetsuo, and others Plant-Growth Activity of α-Alkylphenylacetic Acids and 1,2-Benzo-1-cycloalkene-3-carboxylic Acids, 694
Miwa, Tomoo, and others : Xylan of Siphonaceous Green Algae, 82
Mixed Disulphide (D-Penicillamine-Cysteine) : Formation of, by Reaction of D-Benzylpenicilloic Acid with Cystine (Dr. Bernard B Levine), 940
Mixed Solvent Systems · Activity of Bovine Pancreatic Ribonuclease A in (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Mixtures of Hard Spheres : Packing of (Prof. Paul C. Mangelsdorf, Jun , and Elmer L. Washington), 930
MNSs Gene Frequencies in English Blood Donors (Dr. T. E. Cleghorn), 701
Moata · Australia's Second Atomic Reactor, 741
Mockler, R. C , and others . A Comparison of Atomic Beam Frequency Standards, 681
Mode of Action of Micrococcal Phosphodiesterase (Dr K. K. Reddi), 74
Mode of Action of Soluble Matrix Anti-fouling Compositions (A. Partington), 1105
Mode of Formation of 3,4-Benzopyrene in Human Environment (Prof. G. M. Badger, R. W. L. Kimber and T. M. Spotswood), 663
Model, Y. M., and Nudelman, A. V. : The Glacial Cover of the Antarctic, as determined by Seismic Survey, 287
Modèles du Noyau : Les (Michel Trocheris), *review* by Dr. J M. Soper, 979
Models (Molecular and Crystal Structure) : Bibliography on (Deane K. Smith), (United States National Bureau of Standards, Monograph No. 14), 903
Modern Education : Evolution of, *review* by Dr. James L. Henderson, 357
Modern Methods of Crystal Structure Determination (Manchester College of Science and Technology Summer School in), 201
Modern Schools (Secondary) . Science Teaching in (Science Masters' Association Survey on), 206
Modern Science : Causation and, *review* by Dr. J. O. Wisdom, 92
Modernization of the Stockholm Cyclotron, 381
Modes (Rare), in the Spontaneous Fission of Californium-252 (Prof. E. W. Titterton and T. A Brinkley), 228
Modification of the Neurocranium in *Zygaena malleus* and the Nature of the Optic Stalk in Selachii (Dr. A. R. Hamdy), 257
Modification (Hexagonal), of Black Chromium Electro-deposit (Hideya Okada and Takeo Ishida), 496
Modification (Ionospheric), of the Radio Emission from Jupiter (Prof. Alex G. Smith, T. D. Carr, H. Bollhagen, N. Chatterton and F. Six), 568
Mohanrao, Dr. G. J., and others : Fall-out Caesium in Surface Sea Water off the California Coast (1959-60) by Gamma-Ray Measurements, 480
Molecular Basis (Chemical and), of Nerve Activity (David Nachmansohn), *review* by Dr. D. H. Brinton, 447
Molecular Complex of Benzene and Hexafluorobenzene (Dr. C R. Patrick and G. S Prosser), 1021
Molecular Geometry, *review* by Dr. J. W. Cook, 812
Molecular Structure : The Determination of (P. J. Wheatley), *review* by Dr. J. W. Cook, 812
Molecular Weight (High) : Gas-Solid Chromatographic Separation of Hydrocarbons of (C. G. Scott and D A. Rowell), 143
Molecular Weight (Lower) : Determination of Fatty Acids of, by Gas Chromatography (Marie L. Vorbeck, Leonard R. Mattick, Frank A. Lee and Carl S Pederson), 689
Molecular and Crystal Structure Models : Bibliography on (Deane K. Smith), (United States National Bureau of Standards, Monograph No. 14), 903
Molecules (Lithium and Sodium) · Excited Electronic States of (Dr. R F. Barrow, N Travis and C. V. Wright), 141
Molecules (Non-ionized) · Viscosity Increments of (Alfred Polson), 482
Molten Salts : 'Enthalpy Titrations' and Thermochemistry in (Prof. Joseph Jordan, Jurg Meier, Edward J. Billingham, jun , and James Pendergrast), 318
Molybdenum and Strontium : Atomic Absorption Spectrophotometric Determination of (D. J David), 1109
Moncaster, M. E., and others : Gallium Arsenide for γ-Ray Spectroscopy, 405
Monetary Thought and Monetary Policy in England (Prof. R. S Sayers), 844
Monkey : Effects of Medial Temporal Lesions on Taste Preference in the (Dr L Weiskrantz), 879
Monoamine Oxidase : New Inhibitor of (Dr. J. D. Taylor, A. A. Wykes, Y C. Gladish and W. B. Martin), 941
Monoamine Oxidase Inhibitor : Anti-Fertility Action of a (W. G. Spector), 514
Montagu, Prof Ashley : Artificial Thickening of Bone and the Piltdown Skull, 174
Montague, Dr. M. D , and Morton, Prof R. K. : Chemical and Physical Properties of the Small Deoxyribonucleic Acid Component of Crystalline Cytochrome B_2, 916
Montefinale, Dr. Alberto (Papée, Dr Henry M., and) · Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States, 1103
Monteith, Dr. J. L. : Weather Problems in Agriculture (The Carbon Dioxide Flux over a Field of Sugar Beet), 995
Months (Final), and Descent of Satellite *Sputnik* 3 (B. R. May and D. E. Smith), 456
Montmorillonite (Lithium) . Effect of Surface Density of Charge on the Physical Swelling of (Dr. J. P. Quirk and B. K G. Theng), 967
Montmorillonite and Vermiculite (Clay Minerals,) · Aluminium Interlayers in—Laboratory Synthesis (B. L. Sawhney), 261
Moon Radar Determination of the Scattering Properties of the (Dr. Fred B. Daniels), 399
Moon as a Radar Reflector : Roughness of the (Dr. B. H. Briggs), 466, 490
Moore, Prof H. : *Obituary* by Prof R W. Douglas, 1074
Moore, Howard K. (edited by William G Chace and) : Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959, conducted by Geophysics Research Directorate of the Air Force Cambridge Research Center, with the co-operation of Lowell Technological Institute Research Foundation), *review* by Dr. B A. Thrush, 726
Moore, Dr. N. W., and others : Dragonflies, *review* by Dr. D. E. Kimmins, 631
Moore, W. C. : The Plant Pathology Laboratory, Harpenden, 21
Moores, John : At the sixty-sixth Annual Conference of the Museums Association (Relations of Museums and Industry), 657
Moran, Dr. T. (Hinton, Dr. J. J. C., and) : Plant Hormone Activity—Stilboestrol applied to the Wheat Seedling, 258
Morant, M. J. Photo-Injection of Charge into Dielectric Liquids, 48
Mordarska, H., and others : Anti-neoplastic Activity of Tetrahydro-1,3-oxazine Derivatives, 426
Mordarski, M., and others : Anti-neoplastic Activity of Tetrahydro-1,3-oxazine Derivatives, 426
Morgan, Councilman, and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094

Morgan, M. B.: Appointed deputy controller of aircraft (research and development) in the Ministry of Aviation, 646; work of, 646

Moritz, A. G.: Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116

Morphine, Dihydrocodeine and Aminopyrine Analgesia: Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), *erratum*, 559

Morphogenetics of *Micrasterias americana* in Clone Culture (Prof. Paavo Kallio), 164

Morphology (Vertebrate): A Manual of Practical (J. T. Saunders and Dr. S. M. Manton), third edition, *review* by Dr. N. B. Marshall, 9

Morpurgo, Dr. Paul: Appointed Leverhulme Research Fellow in the sociology of nutrition at Queen Elizabeth College, London, 201

Morris, R. N.: Appointed lecturer in econometrics and social statistics at the University of Birmingham, 465

Morrison, Dr. J. W., abd Rajhathy, Dr. T.: Frequency of Quadrivalents in Autotetraploid Plants, 528

Morrow, F., and others: An Improvement in the Ductility of Beryllium at High Temperatures, 494

Morrow, Jr., James E. (Olsen, Y. H., and): Oceanography of Long Island Sound—Guide for Preparing Figures, 123

Mortality (Late Larval and Pupal), in the Wild: Radioactive Labelling of Lepidopterous Larvae—a Method of estimating (L. M. Cook and Dr. H. B. D. Kettlewell), 301

Morton, A. G., and others: Radioactive and Natural Strontium in Human Bone (Atomic Energy Research Establishment, *R*23246), 994

Morton, Maurice (edited by): Introduction to Rubber Technology, *review* by Dr. W. F. Watson, 359

Morton, Prof. R. K. (Montague, Dr. M. D., and): Chemical and Physical Properties of the Small Deoxyribonucleic Acid Component of Crystalline Cytochrome b_2, 916

Mosaic Virus (Cucumber) Infection Process: Direct Infra-Red Spectral Analysis of the (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049

Mosaic Virus (Tobacco): Polyphenol Oxidase Activity of *Nicotiana glutinosa* Leaves infected with (Dr. Masatake Kikuchi and Akira Yamaguchi), 1048

Mosaic Virus (Tobacco) Protein: A Difference between the Sub-Units of ? (Dr. H. G. Aach), 75

Moscardó, Salvador Oliver: Awarded a Spanish fellowship by the Ramsay Memorial Fellowship Trustees, 832

Moscow Physiological Society (U.S.S.R.-Great Britain Society and the): Joint Meeting to celebrate the centenary of the births of W. M. Bayliss and J. S. Haldane, 912

Moser, C., and others: Quantum Chemistry—Methods and Applications, *review* by Prof. H. C. Longuet-Higgins, 541

Mosquito: The Yellow Fever, *review* by Prof. V. B. Wigglesworth, 813

Mosquitoes (Nulliparous): Recognition of, without Dissection (Dr. Philip S. Corbet), 525

Moss, A. A. (Claringbull, Dr. G. F., and): The Enkomi Silver Cup, 1051

Motion (Rotational), of a Rigid Body: Effect of a Resisting Couple on the (T. Nonweiler), 311

Motions: Stellar (Dr. R. v. d. R. Woolley), 841

Motz, Dr. H.: Grant of £500 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of a linear accelerator working at 1·6 cm. (*J*-band), 291

Moullec, Dr. J., and others: Haptoglobin Types in 398 Blood Donors from Dakar (Senegal), 517

Mountains (Gobi): Tectonics of the (V. P. Solonenko and N. A. Florensov), 373

Mourant, Dr. A. E.,: Awarded the Huxley Memorial Medal for 1961 of the Royal Anthropological Institute, 114

Mourkides, G. A., and others: Non-Enzymic Reactions of Indoles with Coenzyme I, 374

Mouse: Dichorial One-Egg Twins in the (Dr. A. J. Bateman), 339

Mouse (Albino): A Transplantable Spontaneous Osteogenic Sarcoma observed in the Muscle Tissue of an (R. G. Herne, M. Gregoire and G. Rona), 1129

Mouse Ascites: Isolation of a Non-pathogenic Tumour-destroying Virus from (Dr. J. G. Bennette), 72

Mouse Ascites Cells: Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in (Dr. A. R. Crathorn and Dr. K. V. Shooter), 614

Mouse Eggs: Development of, beneath the Kidney Capsule (D. R. S. Kirby), 707

Mouse Kidney undergoing Compensatory Hypertrophy: Radiosensitivity of (Lieut. V. J. Rosen, Jun., and Dr. L. J. Cole), 612

Mouse (L1210) Leukaemia Cells: Effect of 6-Mercaptopurine on the Net in vitro Gas Production of Sensitive and Resistant (Dr. H. J. Woodliff), 156

Mouse Skin (Precancerous): Mast Cells and 5-Hydroxytryptamine in (Dr. R. E. Coupland and Dr. J. F. Riley), 1128

Mouse Tumours: Localization of a Halogenated Porphyrin in (K. I. Altman and Prof. K. Salomon), 1124

Mouth and Blastopore (Dr. Joan B. Williams), 1132

Moving Envelopes of Stars (Prof. V. V. Sobolev), translated by Sergei Gaposchkin, *review* by Prof. W. H. McCrea, 538

Mozley, Dr. Alan: Ecological Processes, *review* by W. H. Dowdeswell, 451

Mucoid Substances of the Aorta: Role of, in the Deposition of Lipids (Dr. S. Gero, Dr. J. Gergely, Dr. T. Dévényi, Dr. L. Jakab, Dr. J. Székely and Dr. S. Virág), 152

Mucosa (Gastro-intestinal): Action of some Surface-active Compounds on the (Dr. J. A. Nissim), 305

Mullaly, Terence: At the sixty-sixth Annual Conference of the Museums Association (Purchase of Art Objects for Museums), 657

Mullard Cryomagnetics Laboratory at Oxford, 25

Müller, Dr. Miklós, and others: Increase of Esterase Activity during Intracellular Digestion in a Histophagous Ciliate, 65

Muller, Paul (edited by): DDT—the Insecticide DDT and its Significance, Vol. 2, Human and Veterinary Medicine (Dr. W. J. Hayes, Jr., Dr. S. W. Simmons and Dr. E. F. Knipling), (edited by Dr. S. W. Simmons), *review* by Prof. D. S. Bertram, 271

Mullins, L., and Turner, D. T.: Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber, 145

Multiple Nature of Cellulase of *Myrothecium verrucaria*: Evidence for (P. Y. F. Prins-van der Meulen and G. J. Schuringa), 695

Munro, Dr. G. H.: Ionospheric Information from Satellite Signals, 1017

Muramic Acid and other Amino-Sugars: Glucosamine Values of, by the Elson and Morgan Method (R. E. Strange), 38

Murine Hepatitis Virus: Protection against Liver Injury due to (Dr. J. D. Judah, G. Bjotvedt and T. Vainio), 507

Murdock, W. W.: Awarded a Nature Conservancy Research Studentship for post-graduate training in Ecology (Zoology), 742

Murine Leukaemia: Bone Marrow Depression in (James T. Duhig), 71

Murphy, A. J., and Kennedy, A. J.: Combustion and Propulsion—High Mach Number Air-breathing Engines (Materials Problems raised by the Very High Temperatures of Hypersonic Air-breathing Engines), 21

Murphy, Dr. Gardner: Human Potentialities, *review* by Dr. D. J. West, 270

Murphy, I. C., and others: Preliminary Psychomotor Stress Studies with Subnormal Psychopathic Subjects, 172

Murphy, M. A.: Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Zoology), 742

Murray, Dr. R. W.: Electrical Sensitivity of the Ampullae of Lorenzini, 957

Murray, Dr. W. L.: Theory of High Explosives, *review*, 539

Murthy, D. V.: Insects attacking *Striga*, 959

Musa ensetaformis Berry: *Ensete berryi*— Revised Name for (R. K. Jain), 342

Muscle (Anterior Byssus Retractor), of *Mytilus edulis*: The Membrane Potential of the (Dr. D. H. Paul), 1121

Muscle (Heart), of the Rat and some other Mammals: Potentiation of Contractility in the (Dr. V. Kruta and Dr. P. Braveny), 327

Muscle (Nerve—Smooth) Transmission: Autonomic (G. Burnstock and Mollie E. Holman), 951

Muscle (Striated): A Hypothesis of Contraction in (Dr. M. Spencer and Dr. C. R. Worthington), 388

Muscle (Vascular): Effect of the Cations of the Lyotropic Series on the Tension of (Prof. L. Laszt), 329

Muscle Tissue of an Albino Mouse: A Transplantable Spontaneous Osteogenic Sarcoma observed in the (R. G. Herne, M. Gregoire and G. Rona), 1129

Muscle Twitch and Tetanus: *p*H Changes during (A. Distèche), 1119

Muscles (Calcium-deficient): Restoration of Membrane Excitability of, by Anodal Polarization (Prof. K. Koketsu and K. Noda), 243

Muscular Disease Myasthenia gravis (E. R. Bickerstaff and A. L. Woolf), 28; (Violet MacDermot), 28

Muscular Dystrophy Association of America: Grant of 7,000 dollars to the Department of Biomolecular Structure in the University of Leeds, 465

Muscular Type. Visco-elastic Behaviour of Blood Vessels of the (V. Harding and Prof. L. Laszt), 330

Muscular Weakness in Rats: Production of, by a Creatine Analogue (Coy D. Fitch and Prof. James S. Dinning), 421

Museum of Applied Science of Victoria, Melbourne: Annual Report for 1958-59, 372

Museum of English Rural Life: Report for 1959, 26

Museum (National), of Wales: Exhibit to illustrate the interchange of animal species between Wales and some of the Commonwealth Countries, 831

Museum (South African): *Annals* of the, Vol. 45, Part 3, 199

Museum (South Australia): Annual Report for 1958-59, 287

Museums Association: Sixty-sixth Annual Conference, 657

Mushroom Growing (Ministry of Agriculture, Fisheries and Food, Bulletin No. 34), seventh edition, 902

Mutagenesis: Mechanism of Formaldehyde-induced—the Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde (Dr. Thomas Alderson), 485

Mutagenic Activity of Formaldehyde: Mechanism of Formaldehyde-induced Mutagenesis—the Uniqueness of Adenylic Acid in the Mediation of the (Dr. Thomas Alderson), 485

Mutant (A Bacterial), with Impaired Potassium Transport (Dr. Stanley G. Schultz and Dr. A. K. Solomon), 802

Mutant (Polyoma Virus), with a Reduction in Tumour Formation (Dr. Leo Sachs and Dan Medina), 715

Mutant (Streptomycin-dependent), of *Escherichia coli* grown in Limited Amount of Streptomycin: Absence of Carbon Monoxide-sensitive Respiration in a (Hanna Engelberg and Dr. M. Artman), 801

Mutants (Streptomycin-resistant), of *Bacillus subtilis*: Appearance of New Deficient Characters in (Masaaki Kohiyama and Yonosuke Ikeda), 168

Mutation (Brown): Occurrence of a, in the Syrian Hamster (Roy Robinson), 170

Mutations affecting the Density of Bacteriophage λ (G. Kellenberger, M. L. Zichichi and J. Weigle), 161

Myasthenia gravis: The Muscular Disease (E. R. Bickerstaff and A. L. Woolf), 28; (Violet MacDermot), 28

Mycological Conference: Sixth Commonwealth (Commonwealth Mycological Institute), 834

Mycological Institute (Commonwealth): Sixth Commonwealth Mycological Conference, 834

Myers, Charles S. (Harbison, Frederick, and): Management in the Industrial World—an International Analysis, 537

Myers, Dr. D. K.: Synthesis of Diphosphopyridine Nucleotide in Irradiated Rats, 1124

Myrbäck, Prof. Karl: Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079

Myoglobin: Nature of the Haem-binding Groups in Native and Denatured Haemoglobin and (Dr. Joan Keilin), 365

Myrothecium verrucaria: Evidence for Multiple Nature of Cellulase of (P. Y. F. Prins-van der Meulen and G. J. Schuringa), 695

Mythical Science: A, *review* by Dr. K. O. L. Burridge, 7

Mythology (Primitive): The Masks of God— (Dr. Joseph Campbell), *review* by Dr. K. O. L. Burridge, 7

Mytilus edulis: The Membrane Potential of the Anterior Byssus Retractor Muscle of (Dr. D. H. Paul), 1121

NACHMANSOHN, David : Chemical and Molecular Basis of Nerve Activity, *review* by Dr. D H. Brinton, 447
Naito, K., and others : Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the Horseshoe Crab, 1118
Nakai, Takashi, and others : Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin on Tumours induced in Mice by Methylcholanthrene, 335
Nakajima, Koichi, and Koda, Prof Shigeyasu : Borrmann Effect observed in an Aluminium Single Crystal, 53
Nakajo, Prof. Seiichi (Tanaka, Katuhide, and) : Oxytocin in the Neurohypophysis of the Laying Hen, 245
Nakao, Makoto, and others : Adenosine Triphosphate and Maintenance of Shape of the Human Red Cells, 945
Nakao, Toshiko, and others : Adenosine Triphosphate and Maintenance of Shape of the Human Red Cells, 945
Name (Revised), for *Musa ensetaeformis* Berry : *Ensete berryi*— (R. K. Jain), 342
National Academy of Sciences (United States) : Election of Foreign Associates, 198
National Academy of Sciences, United States (National Research Council) : Formation of a Committee on Chemical Control of Agricultural Pests and Conservation of America's Wild-Life, 114
  The Biological Effects of Atomic Radiation, 380
  Publication No 718, More Effective Organization and Administration of Materials Research and Development for National Security, 470
  Publication No 713, Digest of Literature on Dielectrics, Vol. 22, 1958 (edited by R. A Sodermann and L. F Frisco), *review* by S. Weintroub, 728
  Appointment of Prof Robert C Elderfield as chairman of the Division of Chemistry and Chemical Technology, 647
  Appointment of Dr. Edward P. Espenshade, jun., as chairman of the Division of Earth Sciences, 647
  Appointment of Dr Emil W. Haury as chairman of the Division of Anthropology and Psychology, 647
  Appointment of Prof J. Barkley Rosser as chairman of the Mathematics Division, 647
  Annual Report for 1958-59, 749
  Nuclear Science Series, Report No. 29 (Publication No. 752) : Penetration of Charged Particles in Matter—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (edited by A. Vehling), 1086
National Academy of Sciences (United States)—National Research Council (International Union of Nutritional Sciences of the), and others : Fifth International Congress on Nutrition, 201
National Agricultural Advisory Service : Appointment of V. Cory as county advisory officer for Yorkshire (West Riding), 1079
National Bureau of Standards (United States). Monograph No. 14, Bibliography on Molecular and Crystal Structure Models (Deane K. Smith), 903
  Monograph No. 10, The Helium-4 Scale of Temperature (F. C. Brickwedde, H. van Dijk, M. Durieux, J. R Clement and J. K. Logan), 1077
National Central Library : Book-buying Policy of the (S. P. L. Filon), 992
National Centre of Atmospheric Research (United States) : Appointment of Dr Walter Orr Roberts as director, 200
National Chemical Laboratory, Teddington . Report for 1959, 902
  Open Days, 994
National Committee for Physics (Swedish) : Tenth General Physics Conference, 557
National Conference for the Preservation of the Countryside (Council for the Preservation of Rural England), 559
National Council for Technological Awards : Report for 1959-1960, 286
National Engineering Laboratory : Open Days (R I. Lithgow), 899
  Symposium on Flow Measurement in Closed Conduits, 905
National Film Archive : Catalogue, Part 2, Silent Non-Fiction Films (1895-1934), 199
National Institute for Medical Research : Appointment of Prof. P. B. Medawar as director, 374, 991
National Institute for Research in Dairying : Report for 1959, 909
National Institutes of Health (United States) : Appointment of Dr. J. H. Gerber as director of the Center for Aging Research, 374
  Tenth Annual Instrument Symposium and Research Equipment Exhibit, 559
National Laboratory (Oak Ridge) . Joint Conferences on Analytical Chemistry in Nuclear Reactor Technology and Nuclear Reactor Chemistry, 994
National Lending Library for Science and Technology, 992
National Library, Calcutta (compiled by) . Bibliography of Indian Scientific and Technical Publications (Council of Scientific and Industrial Research, New Delhi), 199
National Museum of Wales : Exhibit to illustrate the interchange of animal species between Wales and some of the Commonwealth Countries, 831
National Observatory, Kitt Peak, Tucson, Arizona : Financial support from the United States National Science Foundation for the construction of, 910
National Park : The Serengeti (Sir Landsborough Thomson), 174
National Physical Laboratory : Open Days (H. G. Short), 454
National Radio Astronomy Observatory, Green Bank, West Virginia : Financial support from the United States National Science Foundation for the construction of, 910
National Research Council of Canada and the Chemical Institute of Canada : Tenth High Polymer Forum, 117
National Research Council, United States (National Academy of Sciences) : Formation of a Committee on Chemical Control of Agricultural Pests and Conservation of America's Wild-Life, 114
  The Biological Effects of Atomic Radiation, 380
  Publication No. 718, More Effective Organization and Administration of Materials Research and Development for National Security, 470

Native Plants (Australian), for Home Gardens (A E Brooks), *review* by Dr. R. Melville, 637
Native and Denatured Haemoglobin and Myoglobin : Nature of the Haem-binding Groups in (Dr. Joan Keilin), 365
NATO . AGARD fourth Colloquium on Combustion and Propulsion (High Mach Number Air-breathing Engines), 18
  Meetings of AGARD for the second half of 1960, 116
  Sixteenth Meeting of the Aero Space Medical Panel of AGARD, 994
  Avionics Panel of AGARD Symposium on Radio Navigation, 1079
NATO in the 1960's—the Implications of Interdependence (Alastair Buchan), 179
Natriferin, the Frog Water-Balance Principle and Arginine Vasotocin : Evidence for the Identity of (Prof Wilbur H Sawyer), 1030
Natural Forest . The Dangerous Concept of the (T R. Peace), 848
Natural History, Society for the Bibliography of : Sherborn Fund Facsimile No. I, Géographie des Plantes (Alexander von Humboldt et A Bonpland), 904
Natural Occurrence of Delayed-type Iso-hypersensitiveness (Dr. Jack R. Battisto), 69
Natural Products : The Chemistry of (Symposium on, sponsored by the International Union of Pure and Applied Chemistry, organized by the Australian Academy of Science), 1080
Natural Resources (Geonomy and), American Institute of : John Fleming Medal awarded to Dr. Maurice Ewing, 905
Natural Strontium (Radioactive and), in Human Bone (J. W. Arden, F. J. Bryant, E H. Henderson, G. D. Lloyd and A G. Morton), 994
Naturalist : Fossils for the, *review* by Prof. S. Simpson, 271
  The Second BBC (edited by Desmond Hawkins), *review* by B. J. G. Marchand, 728
Nature : Are the Laws of, Symmetrical ? (Prof. O R. Frisch), 638
  Fluorine Compounds in—the Distribution of Carbon-Fluorine Compounds in some Species of *Dichapetalum* (Sir Rudolph Peters and R. J. Hall), 573
Nature, Council for : Nature and Conservation in East Anglia, 649
Nature of Adenovirus Nucleic Acid . Site and (Dr. M A. Epstein and Dr. S. J Holt), 1050
Nature of the Haem-binding Groups in Native and Denatured Haemoglobin and Myoglobin (Dr. Joan Keilin), 365
Nature of the Optic Stalk in Selachii : Modification of the Neurocranium in *Zygaena malleus* and the (Dr. A. R. Hamdy), 257
Nature of the Primary Species in the Radiolysis of Aqueous Solutions : Effects of *p*H and the (J. T. Allen and Dr. G. Scholes), 218
Nature (Multiple), of Cellulase of *Myrothecium verrucaria* : Evidence for (P. Y. F. Prins-van der Meulen and G. J Schurings), 695
Nature (The Physical), of Plastic Flow (Dr J. J. Gilman), 374
Nature and Conservation in East Anglia (Council for Nature), 649
Nature and Man (John Hillaby), *review* by T. H. Hawkins, 979
Nature Conservancy : New Nature Reserve at Cwm Glas, Crafnant, 464
  Addition to the Newborough Warren Ynys Llanddwyn Nature Reserve, 464
  Addition to the Coed Rheidol Nature Reserve, 464
  Awards for 1960 of Research Studentships for postgraduate training in Ecology, 742
  The Bangor Research Station of the, 744
  Appointment of Dr. R. Elfyn Hughes as director of the Bangor Research Station, 744
Nature Conservation in Wales, 464
Nature Reserve : Coed Rheidol (Nature Conservancy), 464
  Newborough Warren Ynys Llanddwyn (Nature Conservancy), 464
Nature Reserve (New), at Cwm Glas, Crafnant (Nature Conservancy), 464
Navigation : Radio (Avionics Panel of AGARD Symposium on), 1079
Navy : Basic Research in the (United States Department of Defense, Department of the Navy, Naval Research Advisory Committee), (Report prepared by Arthur D. Little, Inc.), 178
Naval College (Royal), Greenwich . Nuclear Training Facilities at the (Prof J. Edwards), 545
Naylor, E. : A North American Xanthoid Crab New to Britain, 256
Neary, Dr. G J : Ageing and Radiation, 10
Necessary ? : Is Hyperconjugation (C N R. Rao), 913
Necrosis (Autogenous), in an *Antirrhinum* Species Hybrid (B. J. Harrison), 527
Necturus : Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of Kidney Slices from (G Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Nederlands Radiogenootschap, and others : International Symposium on Data Transmission, 290
Nederlandse Vereniging voor Electronenmicroscopie : European Regional Conference on Electron Microscopy, 29

Need for Educational Research, 883
Negative Ions : Isotopic Analysis of Silicon by Solid Source Mass Spectrometry using (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Negherbon, William O. : Handbook of Toxicology, Vol. 3, Insecticides, *review* by Prof. V. B. Wigglesworth, 544
Neglected Problem : Suicide—a, 207
Nemec, Prof. Pavel (Becina, Vladimir, and) : 'pH-Chromatography' of some Amphoteric Antibiotics, 1111
Neohexane : Hydrocracking of Neopentane and, over Evaporated Metal Films (Dr. J. R. Anderson and B. G. Baker), 937
Neonatal Humans (Premature) : Delayed-type Hypersensitivity in (Jonathan W. Uhr. Joseph Dancis and Charlotte Grantz Neumann), 1130
Neopentane and Neohexane : Hydrocracking of, over Evaporated Metal Films (Dr. J. R. Anderson and B. G. Baker), 937
Nephritogenic Streptococci : Immunological Relationships between the Rat Glomerulus and (A. S Markowitz, S. Howard Armstrong, jun., and Daniel S. Kushner), 1095
Neptunium (Uranium, Thorium, Plutonium,) : Crystal Chemistry of Simple Compounds of (E. S. Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Nerve Activity : Chemical and Molecular Basis of (David Nachmansohn), *review* by Dr D. H. Brinton, 447
Nerve Fibres (Degenerating), in Birds : Effect of Cortisone on (Dr. P. Glees), 327
Nerve—Smooth Muscle Transmission : Autonomic (G. Burnstock and Mollie E. Holman), 951
Nervous System (The Central), and Behavior—Transactions of the Second Conference, Princeton, 1959 (edited by Mary A. B. Brazier), *review* by Dr. Henry Miller, 6
Netherlands Chemical Federation (Royal), and others : International Congress on the Technology of Plastics Processing, 559
Neumann, Charlotte Grantz, and others : Delayed-type Hypersensitivity in Premature Neonatal Humans, 1130
Neural Crest Cell (Amphibian) . Pterin Synthesis in the (Tadao Hama and Masataka Obika), 326
Neurocranium in *Zygaena malleus* : Modification of the, and the Nature of the Optic Stalk in Selachii (Dr A. R. Hamdy), 257
Neurohypophysis of the Laying Hen : Oxytocin in the (Katuhide Tanaka and Prof. Seiichi Nakajo), 245
Neuromuscular Junction (Crayfish) : Excitation at the, with Decreased Membrane Conductance (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 246
A Second Mechanism of Inhibition at the (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 247
Neuropathology and Psychiatry, Korsakov Journal of : English translation of, 649
Neuropharmacology—Transactions of the Fourth Conference, Princeton, 1957 (edited by Harold A. Abramson), *review* by Dr. D. H. Brinton, 447
Neuropsychiatric Research Unit of the Medical Research Council transferred from the Whitchurch Hospital, Cardiff, to the Council's Laboratories at Carshalton, 466
Neuropsychiatry : Recent American Research in, *review* by Dr. D. H. Brinton, 447
Neurosecretory Hypothalamic System : Antigonadotropic Function of the Pineal Gland and the Oxytocin of the (Prof. S.-M. Milcou and S. Pavel), 950
Neurospora crassa . Action of Nucleic Acids on the Inhibition of Growth by Actinomycin of (Dr. W. Kersten, Dr. H. Kersten and Prof. H. M. Rauen), 60
Neutral Carbohydrates : Presence of, in Human Aortic Tissue (Dr. Sv. Bertelsen), 411
Neutron Activation : Non-destructive Analysis of Selenium by, followed by Gamma-Ray Spectrometry (Dr. Minoru Okada), 594
Neutrons (Thermal) : Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
New All-Transistor Digital Computer : *Leo III*, a (Leo Computers, Ltd.), 373
New American Observatories (V C Reddish), 910
New Benzothiadiazine Diuretic : A Potent (Dr. Richard M. Taylor and Martin M. Winbury), 603
New Bicyclopentyl Derivatives : Conversion of Cyclopentadiene into—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy (C. F. Blakely, Dr. R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662 ; Kinetics and Mechanism (C. F Blakely and Dr A. Wassermann), 662
New Biologian, No. 9 (Lancaster Royal Grammar School Natural History Society), 649
New British Analogue Computer, the *Radic* (The Redifon Company), 288
New Chemical Laboratories in the University of Sydney (Prof. R. J. W. LeFevre), 833
New Compounds for the Control of Water Evaporation (A. V. Deo, N. R. Sanjana, S. B. Kulkarni, M. K. Gharpurey and A. B Biswas), 870
New Deficient Characters in Streptomycin-resistant Mutants of *Bacillus subtilis* : Appearance of (Masamichi Kobiyama and Yonosuke Ikeda), 168
New Filmstrips (Educational Publications, Ltd , Wakefield), 832
New Frontiers in Optics and Spectroscopy (Pittsburgh Conference and the Optical Society of America Symposium on), 289
New Gas Chromatography Research Center (Barber-Colman Company, Houston), 289
New Horizons in Chemistry (Sir Alexander Todd), 819
'New' Human Blood Group Antigen, Sw^a (Dr T. E. Cleghorn), *erratum*, 743
New Hydrides of Iron and Osmium : Some (Dr. J. Chatt, F. A. Hart and R. G. Hayter), 55
New Inhibitor of Monoamine Oxidase (Dr. J. D. Taylor, A. A. Wykes, Y. C. Gladish and W. B. Martin), 941
New Laboratory of the Department of Metallurgy, University of Oxford, 105
New Limit to the Galactic Magnetic Field set by Measurements of the Zeeman Splitting of the Hydrogen Line (Dr R. D. Davies, C. H. Slater, W. L. H. Shuter and P. A. T. Wild), 1088
New Metabolite of Epinephrine and Norepinephrine in Liver and Kidney : Formation of a (Dr. M. Goldstein and Dr. S. B. Gertner), 147
New Method for the Differential Precipitation of Nucleic Acids from Aqueous Solutions (William G. Aldridge), 323
New Method for the Synthesis of Cyclic Ethers (L. F. Schmoyer and L. C. Case), 592
New Mexico (West-Central) : Anomalous Leads from a Selected Geological Environment in (William F Slawson and Carl F Austin), 400
New Nature Reserve at Cwm Glas, Crafnant (Nature Conservancy), 464
New Phase in a Silicon bearing 17 per cent Chromium, 8 per cent Nickel and 1 per cent Niobium Steel (M. J. O'Hara, D Wilkinson and R. T. Allsop), 407
New Plasma Confinement Geometry (James L. Tuck), 863
New Principle in Weaving, 27
New Proposal : Valence-Bond Structures—a (Dr. J. W. Linnett), 859
New Research Reactor . *Hector*, a (United Kingdom Atomic Energy Authority), 992
New Species of Green Sulphur Bacteria (V. V. Shaposhnikov, E. N Kondrat'eva and V. D. Federov), 167
New States : The Public Service in—a Study in some Trained Manpower Problems (Kenneth Younger), 971
New Study of the British Odonata, *review* by Dr D. E. Kimmins, 631
New Technique for Following Rapid Rates of Crystallization (J. H Magill), 770
New Treatise on Plant Physiology, *review* by Prof Walter Stiles, 889
New York Academy of Sciences . Annals, Vol. 85, Article 2, Freezing and Drying of Biological Materials (Dr. Harold T. Meryman, and 12 other Authors), 748
New York Academy of Sciences (Division of Anthropology), and the Research Institutute for the Study of Man : Conference on Culture, Society and Health, 658
New Zealand : The Polychaeta Family Longosomidae in (Prof G. A. Knox), 1131
University Education in (Prof. V J Chapman), 107
New Zealand Department of Scientific and Industrial Research : Appointment of Dr. F. F. Evison as superintendent of the Seismological Observatory, Wellington, 830
New Zealand Universities . Report of the Committee on, 107
New-born Mice : Fate of Homologous Adult Spleen Cells injected into (A. J. S. Davies and Sheila M. A. Doak), 610
New-Born Opossum (*Didelphis virginianam*) : Wound Healing in the (Prof. Matthew Block), 340
Newborough Warren Ynys Llanddwyn Nature Reserve : Addition to the (Nature Conservancy), 464
Newer Metals : The, *review* by Prof. A. G. Quarrell, 725
Newly Discovered Rock-Shelter Art in Malaya (J M. Matthews), 373
Newspaper (The English), since 1900 (F. Atkinson), 116
Newspapers (British Journals and) : Bibliography of, 116
Newstead, Prof. Gordon : General Circuit Theory, *review* by Prof. A. H. M. Arnold, 811
Newton, Dr. D. C , and others : Isotopic Analysis of Silicon by Solid-Source Mass Spectometry using Negative Ions, 683
Newton, Isaac : The Correspondence of (edited by Prof. H W. Turnbull), Vol. I, 1661-1675, *review* by Prof. L. Rosenfeld, 537
Niblett, Prof. W R. : Graduate Schools in British Universities, 560
Nickel and Cobalt: Determination of, by Atomic Absorption (J. E. Allan), 1110
Nickel (8 per cent), and 1 per cent Niobium Steel : A New Phase in a Silicon bearing 17 per cent Chromium, (M. J. O'Hara, D. Wilkinson and R. T. Allsop), 407
Nickel Orthosilicate : Olivine–Spinel Transition on (Dr A. E Ringwood), 1019
Nicol, Dr. D. S H W., and Smith, Dr. L. F. : Amino-Acid Sequence of Human Insulin, 483
Nicol, Dr. J. A Colin : The Biology of Marine Animals, *review* by Prof C. M. Yonge, 630
Nicol, Prof T. : Topographical Anatomy of the Dog, *review*, 451
Nicol, Prof. T., and others : Effect of some Aromatic Hydroxy Compounds on the Phagocytic Activity of the Reticulo-Endothelial System, 422
Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the Reticulo-Endothelial System, 1032
Nicolaides, E. D , and others : Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenlyalanyl-L-Arginine, an Octapeptide related to Bradykinin, 773
Nicotiana glutinosa Leaves infected with Tobacco Mosaic Virus : Polyphenol Oxidase Activity of (Dr. Masatake Kikuchi and Akira Yamaguchi), 1048
Nigeria : Use of Dieldrin in the Control of *Glossina palpalis* (R-D) in (J B Davies), 84
Nigeria's Feeding-Stuffs (V. A. Oyenuga), second edition, *review* by Dr. Richard Mellanby, 637
Nigeria (Northern) : Rock Shelter Paintings near Bauchi (Hamo Sassoon), 200
Night Sky in August, 289 ; in September, 650 ; in October, 1079
Niobium : Tantalum and (Dr. G. L. Miller), *review* by Prof. A. G. Quarrell, 725
Niobium Steel (1 per cent) : A New Phase in a Silicon bearing 17 per cent Chromium, 8 per cent Nickel and (M. J. O'Hara, D. Wilkinson and R. T. Allsop), 407
Nisbet, Dr J. D. : The Two Heredities, *review*, 446
Nisizawa, Kazutosi, and others : Xylan of Siphonaceous Green Algae, 82
Nisman, B., and Fukuhara, H. : Cytoplasmic Particles and their Role in Protein Synthesis (Mechanism of Protein Synthesis in Micro-organisms), 645
Nissim, Dr. J. A. : Action of some Surface-active Compounds on the Gastro-intestinal Mucosa, 305
Reduction of the Intestinal Absorption of Glucose, Methionine and Sodium Butyrate by the Cation Trimethylhexadecylammonium, 308
Nitrate (Atmospheric), over the United States : Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride and the Distribution of (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Nitrate Ion : Effect of, on the Distribution of Sucrose in the Rat's Ventricle (S. T. Taketa, C. G. Alexander and Prof G. A. Feigen), 419
Nitration (Radiation-induced), of Aliphatic Hydrocarbons (Dr. Tyson Rigg), 933

Nitrogen and its Compounds : Utilization of, by Plants—Symposia of the Society for Experimental Biology, No 13 (edited by H K. Porter), *review* by Prof. Walter Stiles 815
Nitrogen Fixation : Copper and Cobalt in (Prof E. G. Hallsworth, S. B. Wilson and E. A. N Greenwood), 79
Nitrogen-supplying Power of Soils : Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of Predicting the (A H Cornfield), 260
Nitsan, J : Effect of Glutathione and Alloxan on the Photoperiodic Response of *Xanthium*, 81
Nixon, Dr D. A. Metabolism of ¹⁴C-Mesoinositol in the Rat, 77
Nixon, H. L. (Kassanis, B., and) : Activation of One Plant Virus by Another, 713
Nizamuddin, M., and Womersley, Dr H. B S. · Structure and Systematic Position of the Australian Brown Alga, *Notheia anomala*, 673
Noakes, G R. : Mass, Length and Time, *review*, 183
  The World Around Us, *review*, 975
Noda, K (Koketsu, Prof. K., and) Restoration of Membrane Excitability of Calcium-deficient Muscles by Anodal Polarization, 243
Nodule Bacteria Inhibition of, by an Antibiotic from Legume Seed Coats (J A. Thompson), 619
Noise in Factories (A. G. Aldersey-Williams), 1085
Noise (Geomagnetic), at 230 kc./s (L H. Dowden), 677
Nomenclature of the Keuper Series (P. A. Garrett), 868 ; (Dr. C. J Stubblefield), 869
Non-Cichlid Fishes in Lake Victoria : Breeding Sites of (Dr. Philip S. Corbet), 616
Non-Crystalline Structure in Solidified Gold–Silicon Alloys (W. Klement, jun., R. H. Willens and Prof. Pol Duwez), 869
Non-Destructive Analysis of Microgram Quantities of Silver by Radio-activation (Dr Minoru Okada), 57
Non-Destructive Analysis of Selenium by Neutron Activation followed by Gamma-Ray Spectrometry (Dr. Minoru Okada), 594
Non-Destructive Testing of Materials (British Council Course on), 1079
Non-Disjunction (Meiotic), in Man . Mechanisms of (John S. S Stewart), 804 ; (Dr. Curt Stern), 805
Non-Enzymic Reactions of Indoles with Coenzyme I (Prof S. G A. Alivisatos, G A. Mourkides and A. Jibril), 374
Non-Fibrous Deoxyribonucleoprotein (Water-soluble), from Calf Thymus Nuclei (Dr. Richard S Walsh), 943
Non-Ionized Molecules . Viscosity Increments of (Alfred Polson), 482
Non-Leukaemic Tissues of Thymectomized Mice Recovery of Leukaemogenic Agent from (J F. A P Miller), 703
Non-Linear Problems A Study of, *review* by K. Krickeberg, 727
Non-Linear Problems in Random Theory (Prof Norbert Wiener), *review* by K. Krickeberg, 727
Non-Parasitic Lampreys (Parasitic and) : Development of the Gonads in (M. W Hardisty), 341
Non-Pathogenic Tumour-destroying Virus ` Isolation of a, from Mouse Ascites (Dr J. G. Bennette), 72
Non-Residential Summer School on Numerical Analysis (Delegacy for Extra-Mural Studies, University of Oxford), 374
Non-Specific Haemagglutinin from Cellulose and Cellulose Ion Exchanger (Prof. B. Schmidt. Dr. K Grossgebauer and D. Hartmann), 790
Non-sporulating Yeast (An Acid-tolerant and), from Passion Fruit Juice (B. A. S. Rao and J. S. Pruthi), 342
Non-Static Systems : Astrophysics of, *review* by Prof. W. H. McCrea, 538
'Non-Tasters' ('Tasters' and), of 6-*n*-Propylthiouracil . Differential Reactivity of Saliva from (Frances Griffin and Prof Roland Fischer), 417
Nonanal as a Growth Factor for Wood-rotting Fungi (Prof. Nils Fries), 166
Nonanal Residues in Potatoes : Determination of (W. F. van Vliet and W. H Schriemer), 235
Nonweiler, T : Effect of a Resisting Couple on the Rotational Motion of a Rigid Body, 311
Noradrenaline labelled with Tritium : Effect of Cocaine on the Disposition of (Dr L. G. Whitby, G. Hertting and Dr. J Axelrod), 604
Noradrenaline to Adrenaline : Proportion of, in the Adrenal Glands of Litter-mate Cats (Dr. K. R. Butterworth and Dr. Monica Mann), 785
Norbury, Dr. J. F Appointed to a senior lectureship in fluid mechanics in the University of Liverpool, 117
Nordin, Albert A. (Bloch, Prof. Hubert, and) : Production of Tuberculin Sensitivity, 434
Norepinephrine in Liver and Kidney : Formation of a New Metabolite of Epinephrine and (Dr M Goldstein and Dr. S. B Gerstner), 147
Normal Human Sera : Immuno-Electrophoretic Differentiation of Haptoglobins from another Group-Specific Inheritable System in (Dr. Jan Hirschfeld), 126
Normal Urine : The Plasma Proteins in (Dr I. Berggård), 776
Normal and Leukaemic Subjects · Zinc Content of Erythrocytes and Leucocytes of Blood of (E. Dennes, R. Tupper and Prof A Wormall), 302
Normal (Superconducting-) Transition in Tin Films : Speed of the (D. J. Oliver, M. J. Rayner and E. H. Rhoderick), 492
Norman, Ulla (Revész, László, and) : Chromosome Ploidy and Radiosensitivity of Tumours, 861
Norrish, R. S. . Infra-Red Frequency Shifts, 142
North (David) Plant Research Centre, Brisbane (K. T Glasziou), 745
North African Prehistory, *review* by M. C. Burkitt, 1062
North America : Sap-Transmissible Viruses associated with Diseases of Grape Vines in Europe and (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
North America, Arctic Institute of : Grant-in-Aid Programme, 831
North American Fresh-Water Biology, *review* by Dr. T. T. Macan, 6
North American Xanthoid Crab New to Britain (E. Naylor), 256
North Sea (Central) : A Quantitative Investigation of the Echinoderm Fauna of the (Dr. Erik Ursin), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr A. J. Southward, 360
Northampton College of Advanced Technology, London : Advanced Course on Direction and Supervision of Scientific and Engineering Personnel, 905
Northern Africa : The Stone Age in (Dr. C. B. M. McBurney), *review* by M C. Burkitt, 1062
Northern Highlands : Scotland—the (Dr. J. Phemister), (Handbook of Regional Geology), third edition, 831
Northrop, D. C., and others Gallium Arsenide for γ-Ray Spectroscopy, 405
Norwegian Sea : Investigations on the Quantitative and Qualitative Distribution of Zooplankton in the Southern Part of the (V K. Hansen), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A J. Southward, 360
Nose and Skin : Bacterial Population of the (H. Williams Smith and W. E. Crabb), 288
Not Enough · Chemistry is (Dr. James Taylor), 841
Notheia anomala (Australian Brown Alga) : Structure and Systematic Position of the (M. Nizamuddin and Dr H B. S. Womersley), 673
Novikoff, A. B. : Intracellular Localization of Enzymes, 836
Noyau . Les Modèles du (Michel Trocheris), *review* by Dr J. M. Soper, 979
Nucci, L M (Zipkin, M. A., and) : Combustion and Propulsion (High Mach Number Air-breathing Engines), 19
Nucléaires (Réacteurs) : Évacuation et Récupération de la Chaleur des (Richard Alami et Paul Ageron), *review* by R J. Syme, 636
Nuclear Energy Industry in France Electronic Equipment used in the (P. Desneiges, M. Doireau, L Koch and J. Weill), 1076
Nuclear Engineering Abstracts, Vol 1, No. 1, 993
Nuclear Fission in the Early History of the Earth (Prof P. K. Kuroda), 36
Nuclear Handbook (consulting editor, Prof. O. R. Frisch), *review* by K. E. B. Jay, 273
Nuclear Magnetic Resonance, *review* by Dr. L M. Jackman, 358
Nuclear Magnetic Resonance : High-resolution (J. A. Pople, W. G. Schneider and H. J. Bernstein), *review* by Dr. L. M. Jackman, 358
Nuclear Physics (Institute of Physics and the Physical Society Conference on), 832
  'Memories' for (G W Hutchinson), 854
Nuclear Physics Instruments : Application of Computer Techniques to (G G. Scarrott), 854
Nuclear Power (Ministry of Power Programme), 1055
Nuclear Power Plant Design : Evolution of (Sir Christopher Hinton), 1064
Nuclear Weapon Debris : Fractionation of (Prof. C. Sharp Cook, R. L. Mather, R F. Johnson and F M. Tomnovec), 1100
Nuclear Reactor Chemistry (Oak Ridge National Laboratory Conference on), 994
Nuclear Reactor Technology : Analytical Chemistry in (Oak Ridge National Laboratory Conference on), 994
Nuclear Research in the U.S.S.R., *review* by Dr S. C. Curran, 630
Nuclear Safety, Advisory Committee on . Appointment of an, 113
Nuclear Science . Annual Review of (edited by Emilio Segrè and Leonard L Schiff, in association with Gerhart Friedlander and Walter E. Meyerhof), Vol. 9, *review* by Dr. E. B. Paul, 182
  Progress in, *review* by Dr. E. B Paul, 182
Nuclear Sciences, Boris Kidrich Institute of : Bulletin, Vol. 10, 831
Nuclear Structure : International Conference on, 290
Nuclear Training Facilities at the Royal Naval College, Greenwich (Prof. J. Edwards), 545
Nucleated and Enucleated Fragments of *Amoeba proteus* : Effect of Pyruvate upon (Dr. Edmund Guttes and Sophie Guttes), 432
Nuclei (Atomic) : Theory of (Publication by the Physical Society of Japan of a volume of papers on), 743
Nuclei (Calf Thymus) : Water-soluble, Non-fibrous Deoxyribonucleoprotein from (Dr. Richard S. Walsh), 943
Nuclei (Somatic Cell) . Absorbance of Feulgen-stained (Dr. Symon Iversen), 86
Nucleic Acid in *T₂* Bacteriophage : Evidence for Internal Organization of (Irwin J. Bendet, David A. Goldstein and Max A. Lauffer), 781
Nucleic Acid (Adenovirus) : Site and Nature of (Dr. M. A. Epstein and Dr. S. J. Holt), 1050
Nucleic Acids : Action of, on the Inhibition of Growth by Actinomycin of *Neurospora crassa* (Dr. W. Kersten, Dr. H. Kersten and Prof. H. M. Rauen), 60
  The Biosynthesis of (Biochemical Society Colloquium on), 994
  Microbial Synthesis of Protein in relation to the Biogenesis of, with *Azotobacter vinelandii* as the Test Organism (Maharani Chakravorty), 239
Nucleic Acids from Aqueous Solutions : A New Method for the Differential Precipitation of (William G. Aldridge), 323
Nucleic Acids and Nucleoproteins : Chemical Effects of Ionizing Radiations on (P. Emmerson, Dr. G. Scholes, D. H. Thomson, J. F. Ward and Prof. J Weiss), 319
Nucleoprotein in the Cell Nucleus Selective Cytochemical Demonstration of Arginine Groups in (Dr. E. A Barnard and Dr L. G. E. Bell), 508
Nucleoprotein (Thymus) : Labilization of Deoxyribonucleic Acid in, after Whole-body Irradiation (Dr. Ulrich Hagen), 1123
Nucleoproteins : Chemical Effects of Ionizing Radiations on Nucleic Acids and (P. Emmerson, Dr. G. Scholes, D H. Thomson, J. F. Ward and Prof. J. Weiss), 319
Nucleotide (Diphosphopyridine) : Synthesis of, in Irradiated Rats (Dr. D. K. Myers), 1124
Nucleotide and Catecholamine Content of the Denervated Adrenal Medulla of the Rat : Effect of Reserpine on the (Prof. Nils-Åke Hillarp), 1032
Nucleotides (Pyridine), in Liver Poisoning : Levels of (Dr. C. H. Gallagher and Dr. K. R. Rees), 148
Nucleus (Cell) : Selective Cytochemical Demonstration of Arginine Groups in Nucleoprotein in the (Dr E. A Barnard and Dr L. G. E Bell), 508
Nucleus and Cytoplasm : The Relationship between—Proceedings of the Symposium held at the Université Libre de Bruxelles, 1958 (edited by Dr. R. J. C. Harris), *review* by Dr. E. N. Willmer, 450
Nudelman, A. V. (Model, Y. M., and) : The Glacial Cover of the Antarctic, as determined by Seismic Survey, 287
Nuffield Foundation : Grant of £50,000 to the Borough Road College, Isleworth, for a new science block to be known as the Nuffield Science Building, 371
Nuffield Foundation (a Study sponsored by the) : Principles for British Agricultural Policy (edited by H. T. Williams), *review* by Sir John Russell, 721
Nuffield Foundation (Royal Society and) Commonwealth Bursaries Scheme : Awards, 291
Nulliparous Mosquitoes : Recognition of, without Dissection (Dr. Philip S Corbet), 525
Nullius in verba, *review* by Dr. William P. D. Wightman, 356

Numerical Analysis (Delegacy for Extra-Mural Studies, University of Oxford, Non-residential Summer School on), 374
Numerical Data: Tables of Constants and, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids (Prof. J.-P. Mathieu and Prof. M.-M. Janot), *review* by Dr. J. Walker, 7
Nutrients: Foliar Application of, and Rhizosphere Microflora of *Camellia sinensis* (Dr. C. S. Venkata Ram), 621
Nutrition (International Union of Nutritional Sciences, the American Institute of Nutrition and the United States National Committee, and the International Union of Nutritional Sciences of the United States National Academy of Sciences—National Research Council fifth International Congress on), 201
Nutrition of the Legumes—Proceedings of the University of Nottingham Fifth Easter School in Agricultural Science, 1958 (edited by Prof. E. G. Hallsworth), *review* by Prof. Walter Stiles, 815
Nutrition, American Institute of: Election of Dr. W. R. Aykroyd as an honorary member, 29
  Election of honorary members, 374
Nutrition of Sows: Experiments on the (Dr. G. A. Lodge), 115
Nutrition Society (Scottish Group): Symposium on Food Habits in Britain, 905
Nutrition (Plant): Aspects of, *review* by Prof. Walter Stiles, 815
Nutritional Sciences, International Union of, of the United States National-Academy of Sciences—National Research Council, and others: Fifth International Congress on Nutrition, 201
Nutritive Values of Carbohydrates for the Silkworm, *Bombyx mori* (Dr. Toshio Ito), 527
Nutzenergie aus Atomkernen (Dr. Karl Rudolf Schmidt), *review* by K. R. E. Smith, 979
Nyholm, Prof. R. S., and others: Orienting Effects in Octahedral Aquation, 477
Nylander, Prof. Gunnar: Urinary Excretion of Œstrogens in Cases of Chronic Prostato-vesiculitis, 154

OAK RIDGE National Laboratory: Joint Conferences on Analytical Chemistry in Nuclear Reactor Technology and Nuclear Reactor Chemistry, 994
Oakley, Dr. Kenneth P.: Artificial Thickening of Bone and the Piltdown Skull, 174
Öberg, K. E. (Lindahl, Prof. P. E., and): Mechanism of the Physiological Action of Rotenone, 784
Oberry, J. L. (Connors, J. F., and): Combustion and Propulsion—High Mach Number Air-breathing Engines (Basic Studies on Air Intakes), 20
Obika, Masataka (Hama, Tadao, and): Pterin Synthesis in the Amphibian Neural Crest Cell, 326
Obligately Parasitic and Saprophytic Fungi: Incorporation of Acetate into Protein by (Dr. Richard C. Staples and Dr. H. P. Burchfield), 1040
O'Brien, Prof. R. N., and Rosenfield, C.: Possible Discovery of Ion-Pairs by Interferometry, 935
Obruchev, S. V.: The Problem of the 'Abominable Snowmen', 558
Observation (Direct), of Surface Contamination formed in Demountable Vacuum Systems (D. E. Bradley), 227
Observations of 'Whistlers' and 'Chorus' at the South Pole (Dr. L. H. Martin), 1018
Observations (Electrophysiological), on a Sound-producing Fish (A. Packard), 63
Observations (International Geophysical Year): Distribution of Atmospheric Ozone—a Preliminary Analysis of some (J. MacDowall), 382
Observatoires Astronomiques et les Astronomes (Fernand Rigaux), *review* by Dr. R. v. d. R. Woolley, 1063
Observatories: New American (V. C. Reddish), 910
Observatories (Cape and Royal Greenwich): Integration of the, 464
Observatory (National), Kitt Peak, Tucson, Arizona: Financial support from the United States National Science Foundation for the construction of, 910
Observatory (National Radio Astronomy), Green Bank, West Virginia: Financial support from the United States National Science Foundation for the construction of, 910
Observatory (Seismological), Wellington, New Zealand: Retirement of R. C. Hayes as superintendent, 24
  Appointment of Dr. F. F. Evison as superintendent, 830
Observing π-Mesonic X-Rays: The Method of (Dr. D. West), 853
Occurrence of a Brown Mutation in the Syrian Hamster (Roy Robinson), 170
Occurrence of Free D-Serine in the Earthworm (Dr. H. Rosenberg and Prof. A. H. Ennor), 617
Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in comparison with Man, Horse, Sheep and Dog (Dr. C. J. G. van der Horst), 146
Occurrence of *Pyrosoma* on the Continental Slope (T. R. Cowper), 878
Occurrence of Spread F Echoes at Low Latitudes: Possibility of Detecting Ionospheric Drifts from the (R. W. Knecht), 927
Occurrence (Alleged), of the Perchlorate Ion in Sea-Water (R. Greenhalgh and Dr. J. P. Riley), 1107
Occurrence (Natural), of Delayed-type Iso-hypersensitiveness (Dr. Jack R. Battisto), 69
Occurrence (Possible), of Interference Systems in Virus-infected Plants (A. D. Thomson), 761
Occurrence and Function of the Provisional Embryonic Cuticle of a Lepidopteran (Dr. R. K. Sharan), 1040
Ocean: Introduction to the Theory of Sound Transmission with Application to the (Prof. C. B. Officer), *review* by Dr. A. B. Wood, 539
Ocean (Eastern Atlantic): Magnetization of Sediment Cores from the (M. J. Keen), 220
Ocean Currents in McMurdo Sound (A. E. Gilmour, W. J. P. Macdonald and F. G. Van der Hoeven), 867
Ocean (Indian) Expedition (Dr. G. E. R. Deacon), 561
Oceanographic Institution (Woods Hole): First Henry Bryant Bigelow Medal awarded to Dr. H. B. Bigelow, 647
Oceanographic Research: Intergovernmental Conference on, 647
Oceanographic and Fisheries Research by the Submarine *Severyanka* (V. P. Zaitsev), 559
Oceanography of Long Island Sound (Gordon A. Riley, Eugene Harris, Henry M. Schurr, P. T. Wangersky, Sarah W. Richards and R. Wade Covill); Guide for Preparing Figures (Y. H. Olsen and James E. Morrow, Jr.), 123
Ochterlony Technique using Antigen or Antiserum labelled with Iodine-131 (Joan M. Rhodes), 793
Octahedral Aquation: Orienting Effects in (Sir Christopher Ingold, Prof. R. S. Nyholm and Dr. M. L. Tobe), 477
Octapeptide related to Bradykinin: Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an (E. D. Nicolaides, H. A. DeWald, Patricia G. Shorley and Dr. H. O. J. Collier), 773
Odell, Dr. N. E.: Appointed to the chair of geology in the University of Peshawar, 905
Odonata (British): A New Study of the, *review* by Dr. D. E. Kimmins, 631
Oedipus and Job in West African Religion (Prof. Meyer Fortes), *review* by Michael Argyle, 96
17β-Œstradiol Dehydrogenases: Histochemical Localization of Human, Term Placental—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Œstrogens: Urinary Excretion of, in Cases of Chronic Prostato-vesiculitis (Prof. Gunnar Nylander), 154
Officer, Prof. C. B.: Introduction to the Theory of Sound Transmission with Application to the Ocean, *review* by Dr. A. B. Wood, 539
Offshore Waters of the Sierra Leone River: Plankton of the Estuary and (V. Bainbridge), 557
O'Flaherty, Fred, and others (edited by): The Chemistry and Technology of Rubber, Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
Ogston, Dr. A. G., and Phelps, C. F.: Exclusion of Inulin from Solutions of Hyaluronic Acid, 1024
O'Hara, M. J., and others: A New Phase in a Silicon bearing 17 per cent Chromium, 8 per cent Nickel and 1 per cent Niobium Steel, 407
Oil in Britain: Search for, 1078
Oil Drilling: Submarine (M. L. Kalinko), 903
Oil-immersion, Phase-contrast and Dark-ground Viewing of Thorotrast in Tissue Sections: Combined (Dr. E. W. Baxter), 162
Okada, Hideya, and Ishida, Takeo: Hexagonal Modification of Black Chromium Electro-deposit, 496
Okada, Dr. Minoru: Non-destructive Analysis of Microgram Quantities of Silver by Radioactivation, 57
  Non-destructive Analysis of Selenium by Neutron Activation followed by Gamma-Ray Spectrometry, 594
Olcott, Prof. H. S.: Physico-chemical, Biological and Applied Aspects of Autoxidation (Effects of Tocopherols in Autoxidizing Systems), 747
Oldfield, Prof. R. C.: Experiment in Psychology—a Centenary and an Outlook (Presidential Address to Section J (Psychology) of the British Association for the Advancement of Science), 846
Oldroyd, H.: South African Animal Life, *review*, 1063
Oligocene: The American (Dr. R. M. Stainforth), 678; (F. E. Eames, F. T. Banner, W. H. Blow and W. J. Clarke), 679
Oligochaete Fauna of Three Danish Brackish Water Areas (Ingerlise Dahl), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A. J. Southward, 360
Oligotrich Protozoa (Rumen): Effect of Penicillin on the Maintenance of (G. S. Coleman), 518
Oliver, D. J., and others: Speed of the Superconducting-Normal Transition in Tin Films, 492
Oliver, Dr. J. H.: *Obituary* by N. Ingram Hendey, 111
Oliver, R., and others: Analysis of Metabolic Rates at the Cellular Level, 919
Oliver Memorial Fund: Annual Award for work on Blood Transfusion, 201
Olivine—Spinel Transition on Nickel Orthosilicate (Dr. A. E. Ringwood), 1019
Olsen, Y. H., and Morrow, Jr., James E.: Oceanography of Long Island Sound—Guide for Preparing Figures, 123
Olson, Prof. Robert E.: *Obituary* of Dr. Eric Ellenbogen, 554
Olsson, Dr. B. (Augustinsson, Dr. K.-B., and): A Genetically Determined Enzyme in the Pig, 924
Olszewska, Dr. M. J. (Brachet, Prof. J., and): Influence of Localized Ultra-violet Irradiation on the Incorporation of Adenine-8-^{14}C and DL-Methionine-^{35}S in *Acetabularia mediterranea*, 954
One-Egg Twins in the Mouse: Dichorial (Dr. A. J. Bateman), 339
O'Neill, Dr. L. A.: Physico-chemical, Biological and Applied Aspects of Autoxidation (Problems of Autoxidation in the Paint Industry), 748
Ontario Research Foundation: Annual Report for 1959, 567
Oosterbaan, R. A., and others: Structures of some Acetyl-serine Peptides from Acetyl-chymotrypsin, 596
Operating on Marine Gastropoda: 'Water Rigour' as an Aid when (Prof. B. J. Krijgsman and A. C. Brown), 69
Opinion: Fact and, *review* by Prof. O. L. Zangwill, 817
Opossum (*Didelphis virginianam*): Wound Healing in the New-Born (Prof. Matthew Block), 340
Oppenheim, A. K., and Stern, P. A.: Combustion and Propulsion—High Mach Number Air-breathing Engines (Applicability of Detonation Wave Studies to Hypersonic Combustion), 21
Optic Stalk in Selachii: Modification of the Neurocranium in *Zygaena malleus* and the Nature of the (Dr. A. R. Hamdy), 257
Optical Lever: Some Developments of the (Prof. R. V. Jones), 905
Optical Radiation in Ruby: Stimulated (Dr. T. H. Maiman), 493
Optical Rotatory Powers of Alkaloids, *review* by Dr. J. Walker, 7
Optical Society of America: English translation of the Russian journal *Optika i Spektroscopiya*, 199
Optical Society of America (Pittsburgh Conference and the): Symposium on New Frontiers in Optics and Spectroscopy, 289
Optically Active Forms of a Derivative of Tetra-substituted Sulphur (M. Barash), 591
Optics and Spectroscopy (English translation of the Russian journal *Optika i Spektroscopiya*), (Optical Society of America), 199
Optics and Spectroscopy: New Frontiers in (Pittsburgh Conference and the Optical Society of America Symposium on), 289
Optika i Spektroscopiya (English translation published by the Optical Society of America), 199
Optimal Games: Theory of (Prof. Alan S. C. Ross), 968
Optimal Protein Synthesis by Ascites Tumour Cells *in vitro* (Dr. M. J. Fraser), 1114

Oral Griseofulvin : Tumour-promoting Effect of Excessively Large Doses of, on Tumours induced in Mice by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Orbital Period of *Sputnik 4* Satellite : The Sudden Discontinuity in the (B. R May and D. E Smith), 866
'Order of Magnitude'? . 'Dex' or (Prof J. B. S. Haldane), 879
Ore Minerals : Spectral Reflectivity of (I. Gray and Dr. A. P. Millman), 282
Organ (Gene's) in Ticks : Accessory Glands of (Dr B. Feldman-Muhsam and Y. Havivi), 964
Organic Matrix of Tooth Enamel (J. E. Eastoe), 411
Organic and Inorganic Forms Bacterial Effect and Radiophosphorus Assimilation in, in Salmon (Dr. P. N Srivastava), 83
Organism (Test) : Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the (Maharani Chakravorty), 239
Organism and Milieu : Cell, (edited by Prof. Dorothea Rudnick), (Seventeenth Symposium of the Society for the Study of Development and Growth), *review* by Dr. E. N. Willmer, 450
Organization for European Economic Co-operation (European Productivity Agency) Discussion on Scientific Research into Road Safety, 116
Organization for European Economic Co-operation (European Productivity Agency), and the Centre d'Études Nucléaires : International Information Centre for Food Irradiation, 741
Organization (Internal), of Nucleic Acid in T_2 Bacteriophage : Evidence for (Irwin J. Bendet, David A Goldstein and Max A. Lauffer), 781
Organization and Administration of Materials Research and Development for National Security . More Effective (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Organization and Financing of Research in Biochemistry and Allied Sciences (Biochemical Society and the British Association for the Advancement of Science Colloquium on), 650
Organs (Chordotonal), in Crustacea (Dr. Mary Whitear), 522
Orgel, Dr. L E. . Structure of the Trinuclear Basic Acetates, 504
Orienting Effects in Octahedral Aquation (Sir Christopher Ingold, Prof. R S. Nyholm and Dr. M. L Tobe), 477
Origin of Angiosperms (Prof T M. Harris), 847
Origin of Lipid Bodies (so-called Golgi Bodies) from Mitochondria Cytochemical Evidence of the (H C. Chopra), 713
Origin of the Solar System (Dr. M. M Woolfson), 47 ; (M. H Briggs), 1102
Origin of Tektites (Prof. H. C. Urey), 855
Origin (Axial), of the Terminal Inflorescence in the Genus *Trifolium* (Yvonne Aitken), 622
Origin (A Possible), of Exo-Electron Emission in Plastically Deformed Metals (Dr. A. H. Meleka and W. Barr), 232
Orians, F Barbara, and Brodie, Dr. Bernard B. . A Suggested Effect on Levels of Catecholamine in Brain produced by Small Doses of Reserpine, 1034
Orr, Lord Boyd : Elected an honorary member of the American Institute of Nutrition, 374
Ortho Effect influencing Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin (Dr. H P. Burchfield and Eleanor E Storrs), 593
Orthosilicate (Nickel) : Olivine—Spinel Transition on (Dr. A. E. Ringwood), 1019
Osbaldiston, G. W . Awarded an A D. Allen Memorial Scholarship by the Animal Health Trust, 904
Oscillators (Caesium-controlled) . The 'GBR Experiment'—a Trans-Atlantic Frequency Comparison between (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Oscillatory Character of Amplitude Curves for Seismic Body Waves (Dr. J. Vanek and J. Stelzner), 491
Osgood, Dr. T. H : Influence of Editors, 121
Osinski, Dr. P. A : Steroid 11β-ol Dehydrogenase in Human Placenta, 777
Osmium . Some New Hydrides of Iron and (Dr J Chatt, F A. Hart and R G. Hayter), 55
Osmium Fixation : Induced Fluorescence with Acridine Orange, after (W. J. Randles), 964
Osmotic Regulation in the Larvae of some Euryhaline Diptera (D W. Sutcliffe), 331
Osteogenic Sarcoma : A Transplantable Spontaneous, observed in the Muscle Tissue of an Albino Mouse (R G. Herne, M Gregoire and G Rona), 1129
Ostrea edulis L. from the Limfjord : Conditioning, for Reproduction out of Season (I. A Aboul-Ela), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 25), *review* by Dr A. J. Southward, 360
Ottawa Symposia on Self-Regulation in Living Systems, 3, Tremor, 297
Ottway, G. C. . Elected president for 1960-61 of the Scientific Instrument Manufacturers' Association, 742
Outlook : Experiment in Psychology—a Centenary and an (Prof. R. C Oldfield), 846
Output of Carbon Dioxide of Excised *Bryophyllum* Leaves : Effects of Light and Darkness on the Rhythm of (Dr Malcolm B Wilkins), 523
Output of Power in Great Britain, 557
Output of Scientists in Scotland, 1600-1950 (R. H S. Robertson), 372
Output (Carbon Dioxide) Effect of Electronarcosis on Oxygen Consumption and (Dr Jaroslav Strmiska and Dr Antonín Vacek), 151
Ovarian Maturation : Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a Pregnant Rabbit for (A. R. Mead-Briggs and A J B Rudge), 1136
Ovarioles as a Meristic Character in Coleoptera (Dr. J. G Robertson), 526
Overseas Agricultural and Scientific Research, 556
  Food and Animal Production (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 1070
  Low-priced Books for, 741
  Welsh Emigration (Prof E. G Bowen), 843
Overseas Civil Service : House of Commons Adjournment Debate on the, 371
  Supplementary Pay and Allowances, 556
Overseas Development : Assistance from the United Kingdom for (H M. Treasury), 266
Oviduct of the Hen : Parallel Distribution of Calcium and Citric Acid in the (Dr. T. G Taylor and F. Hertelendy), 244
Owen, L. N. . A Rapid Method for Studying Tumour Blood Supply using Lissamine Green, 795
Owen, Prof Walter S. (Humphreys, J G., and) : An Iron–Silicon Carbide, 589
Owls in Illinois : Population Trends among Hawks and (Richard R. Graber and Jack S Golden), 999
Oxidase (Monoamine) New Inhibitor of (Dr. J D. Taylor, A A Wykes, Y. C. Gladish and W B Martin), 941
Oxidase (Monoamine) Inhibitor : Anti-Fertility Action of a (W. G. Spector) 514
Oxidase Activity (Polyphenol), of *Nicotiana glutinosa* Leaves infected with Tobacco Mosaic Virus (Dr. Masatake Kikuchi and Akira Yamaguchi), 1048
Oxidation of Coal : Initial Stages of (S. K. Chakrabartty, B. K Mazumdar and A. Lahiri), 502
Oxidation of Metals : The Corrosion and (Dr Ulick R. Evans), *review* by Dr. J. M. West, 182
Oxidation of Quinol Phosphates : Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the (Dr V. M. Clark, D. W Hutchinson and Sir Alexander Todd), 59
Oxidation (Radiolytic), of Ferrous Solutions with Standardized Internal Sources of Phosphorus-32 (Dr. M Peisach and J. Steyn), 58
Oxidation (Succinate) in Uncoupled Rat Liver Mitochondria : A High-Energy Phosphate Requirement for (Dr Giovanni Felice Azzone and Dr. Lars Ernster), 65
Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates (Dr V. M. Clark, D W. Hutchinson and Sir Alexander Todd), 59
Oxide (Deuterium) . Ultra-violet Absorption Spectra of Proteins in (Dr. Shiro Takashima), 597
Oxide (Titanium) : A Symmetrical Fourfold Helical Fracture in (J. S. Jackson), 1104
Oxosteroids—the Use of Phenolic Hydrazides for Detection, Characterization and Estimation (Dr. Bernard Camber), *review* by Prof. G. A. D. Haslewood, 183
Oxygen : Role of, in the Cross-linking and Degradation of Deoxyribonucleic Acid by Ionizing Radiations (Peter Alexander and J T Lett), 933
Oxygen-15 Metabolism of (C. T. Dollery and J. B West), 1121
Oxygen Atoms : Recombination of, in the Gas Phase (P G Dickens, R D. Gould, Prof. J. W. Linnett and A. Richmond), 686
Oxygen Consumption and Carbon Dioxide Output : Effect of Electronarcosis on (Dr. Jaroslav Strmiska and Dr Antonín Vacek), 151
Oxygen Consumption Changes in Rats during Irradiation : Role of Initial Value of Metabolic Processes in (Dr A Vacek), 76
Oxygen Ions (High Energy), in Carbon Dioxide Mass Spectra (R M. S Hall), 683
Oxygen-18 Water Solutions (Highly Enriched), containing Hydrogen Peroxide-16,16 : Radiolysis of (Dr. Michael Anbar, Shmuel Guttmann and Prof. Gabriel Stein), 57
Oxytocin in the Neurohypophysis of the Laying Hen (Katuhide Tanaka and Prof Seiichi Nakajo), 245
Oxytocin of the Neurosecretory Hypothalamic System . Antigonadotropic Function of the Pineal Gland and the (Prof S.-M. Milcou and S Pavel), 950
Oyenuga, V A. Nigeria's Feeding-Stuffs, second edition, *review* by Dr. Richard Mellanby, 637
Ozaki, Dr., and Howarth, Dr. : Genetic Recombination in *Salmonella typhimurium* occurring during Transmission of Colicinogeny, 649
Ozone : Pure Rotational Absorption of, in the Region 125-500 Microns (Dr. H A. Gebbie, N. W B Stone and C. D Walshaw), 765
Ozone (Atmospheric) : Distribution of—a Preliminary Analysis of some International Geophysical Year Observations (J. MacDowall), 382

PACIFIC Island : Continuity in a Small, *review* by Sir Harry Luke, 816
Packard, A. Electrophysiological Observations on a Sound-producing Fish, 63
Packing of Mixtures of Hard Spheres (Prof Paul C Mangelsdorf, jun., and Elmer L Washington), 930
Packter, N M , and Glover, Dr. J. : Ubiquinone (50) and Ubichromenol in *Aspergillus fumigatus*, Fresenius, 413
Padmini, P. R K. L (Ramachandra Rao, Prof. B., and) : A Relation between Ultra-sonic Velocity and Latent Heat of Vaporization, 311
Page, Irvine H. (edited by) : Connective Tissue, Thrombosis and Atherosclerosis—Proceedings of a Conference held at Princeton, N J , 1958, *review* by Dr. G. S Boyd, 634
Pagot, J. (Bremaud, O , and) : Problems of the Arid Zones (Nomadism in relation to Grazing Resources—Moving of Flocks in the Sahelian Zone), 296
Paine, R. : At the second Annual Conference of the British Computer Society (A Common Computer Language), 655
Paintings (Rock Shelter), near Bauchi, Northern Nigeria (Hamo Sassoon), 200
Paints (Priming), for Metal : Potentiometric Study of (Dr. N. R Bharucha), 756
Pakistan to Ashoka . Early India and (Sir Mortimer Wheeler), *review* by M C. Burkitt, 94
Palmer, Margaret : Expanded Ilio-Sacral Joint in the Toad *Xenopus laevis*, 797
Paludina vivipara Lin (Snail) . Diplodiscus Species Parasitic in the (M. R Honer), 431
Panattoni, C , and others : Structure of $AgSCN.P(n\text{-}C_3H_7)_3$, 772
Pancreatic Ribonuclease A (Bovine) : Activity of, in Mixed Solvent Systems (Dorothy Findlay, Dr. A P. Mathias and Dr. B R. Rabin), 601
Papée, Dr. Henry M , and Montefinale, Dr. Alberto : Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States, 1103
Paper : Behaviour of, during Tensile Straining (A. E. Ranger and L F. Hopkins), 1097
Papyrus Swamps : Experimental Breeding of *Anopheles gambiae* Giles in (L. K H. Goma), 1137

- Paradoxical Blocking and Arousal in the Drowsy State (Dr. L. Goldie and Dr. J. M. Green), 952
- Paraffin : Crystal Growth in (R. J. Jaccodine), 498
- Parallel Distribution of Calcium and Citric Acid in the Oviduct of the Hen (Dr T. G Taylor and F Hertelendy), 244
- Parallelism of Changes produced by Cooling and by Drugs known to affect Adrenergic Mechanisms (Prof Eleanor Zaimis), 213
- Paramagnetic Resonance in Solids (William Low), (Solid State Physics—Advances in Research and Applications, Supplement 2), *review* by Dr. R O. Davies, 886
- Parameters (Electrodekinetic), at Metal Surfaces : Simultaneous Measurement of Adsorption and (A. M Peers), 503 ; (Dr. E. A. Blomgren and Dr J O'M. Bockris), 504
- Parasites as Enemies and Allies (Dr. J. Mahon), 203 ; (Prof. T. H. Davey), 203
- Parasites (Insect) : Immunity of Aphids to (D C Griffiths), 346
- Parasitic in the Snail *Paludina vivipara* Lm. : *Diplodiscus* Species (M R. Honer), 431
- Parasitic Helminths, *review* by Dr. G Lapage, 815
- Parasitic and Non-Parasitic Lampreys : Development of the Gonads in (M. W. Hardisty), 341
- Parasitic and Saprophytic Fungi (Obligately) : Incorporation of Acetate into Protein by (Dr. Richard C. Staples and Dr. H. P. Burchfield), 1040
- Parchments (British) : Follicle Remains in some (Dr. M. L. Ryder), 130
- Parent and the State : The Child, the (Dr James Bryant Conant), *review* by Brian Holmes, 635
- Paris Hospitals : Medical Research in the, 26
- Park : The Serengeti National (Sir Landsborough Thomson), 174
- Parker, Prof. Frank S., and Kirschenbaum, Prof Donald M. : Infra-Red Spectra of Amino-acids and related Substances in Water, 386
- Parker, Johnson : Survival of Woody Plants at Extremely Low Temperatures, 1133
- Parker, R. P., and others : Comparison of Fission Product and Beryllium-7 Concentrations in the Atmosphere, 550
- Parkes, Dr. A S. : Appointed to the newly established chair of the physiology of reproduction in the University of Cambridge, 113 ; work of, 113
  - Influence of Editors, 120
- Parrish, F. W., and Perlin, A S : Steric Factors affecting the Specificity of Polyglycosidases, 1110
- Parsons Memorial Lecture (1959) of the Physical Society (Dr C. R. Burch), 854
- Part-Time Courses in Further Education (J. Heywood), 189
- Participation in Photosynthesis : Alkaline C-1 Fructose-1,6-diphosphatase—Evidence for its (Dr. Robert Smillie), 1024
- Particle Board Industries (Pulp and) : The Development of, and their Effect on Forest Management (Society of Foresters of Great Britain Discussion on), 32
- Particle Shape Factors in the Sieve Range : A Method for the Routine Measurement of (Dr. Colin C. Harris), 401 , (D. Howitt), 403
- Particles (Charged), in Matter : Penetration of—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (edited by A. Vehling), (United States National Academy of Sciences—National Research Council, Nuclear Science Series, Report No. 29), 1086
- Particles (Cytoplasmic), and their Role in Protein Synthesis (Colloid and Biophysics Committee of the Faraday Society Informal Discussion on), 643
- Partington, A. : Mode of Action of Soluble Matrix Antifouling Compositions, 1105
- Partington, Prof. J. R. : A History of Greek Fire and Gunpowder, *review* by Prof. R. J Forbes, 272
- Pascoe, K. J. : The Strength of Solids, 659
- Pascual, Maria Covadonga Rodriguez Awarded a Spanish fellowship by the Ramsay Memorial Fellowship Trustees, 832
- Passion Fruit Juice : An Acid-tolerant and Non-sporulating Yeast from (B. A S. Rao and J. S. Pruthi), 342
- Past : The Peasant and the (Prof. Estyn Evans), 844
- Pastoral Systems in relation to World Food Supplies (Dr. William Davies), 849
- Pasture Grasses : Fatty Acid Composition of the Lipids of (Dr. G. A. Garton), 511
- Paterson, Dr. W. G. : Canadian fellowship renewed by the Ramsay Memorial Fellowship Trustees, 832
- Pathogenicity of *Metarrhizium anisopliae* (Metch.) Sor. and *Beauveria bassiana* (Bals.) Vuill to Two Species of Elateridae (Dr R. D. Tinline and R Y Zacharuk), 794
- Pathology (Plant), in the British Commonwealth (Dr. G. C. Ainsworth), 834
- Pathology (Plant) Laboratory, Harpenden (W. C. Moore), 21
- Patrick, Dr. C. R , and Prosser, G S. : A Molecular Complex of Benzene and Hexafluorobenzene, 1021
- Pattern of Haemopoiesis in the Foetal Liver (D. Brynmor Thomas, P. M. Russell and Prof. J. M. Yoffey), 876
- Pattern (Electrophoretic), during Amphibian Development (H. Denis), 62
- Patterson, A. T. : Title of reader in history in the University of Southampton conferred on, 290
- Patterson, Dr. D. : Use of Reflectance Measurements in assessing the Colour Changes of Ageing Bloodstains, 688
- Patwardhan, V. N. : Elected an honorary member of the American Institute of Nutrition, 374
- Paul, Dr. D. H. : The Membrane Potential of the Anterior Byssus Retractor Muscle of *Mytilus edulis*, 1121
- Paul, Dr. E. B. : Progress in Nuclear Science, *review*, 182
- Paul Instrument Fund : Grant of £1,000 (in supplement of a previous grant) to Prof. J. D. McGee, for the construction of a television system for X-ray image intensification, 291
  - Grant of £500 (in supplement of a previous grant) to Dr. H. Motz, for the construction of a linear accelerator working at 1·6 cm. (*J*-band), 291
  - Grant of £3,230 (in supplement of a previous grant) to Dr. P. M. B. Walker, for the construction of a high-speed integrating microspectrophotometer, 291
  - A Report on its Activities, 733
- Paull, W. : Theory of Relativity (translated from the German by G. Field), *review* by Dr. D. W. Sciama, 4
- Pauling, Prof. Linus : Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079

  Solid State—Advances in Research and Applications, Supplement 2, Paramagnetic Resonance in Solids (William Low), *review* by Dr. R. O. Davies, 886
Physics, American Institute of : To publish the *Physics of Fluids* monthly starting in 1961, 832

Physics, Institute of, and the Physical Society : Conference on Nuclear Physics, 832
  Conference on Diamond Physics, 905
  Duddell Medal Address, Some Developments of the Optical Lever (Prof. R. V. Jones), 905
  Conference on Statistical Mechanics (with special reference to Irreversibility), 1079
Physics, Swedish National Committee for : Tenth General Physics Conference, 557
Physics of Electrostatic Forces and their Applications (Centre National de la Recherche Scientifique International Colloquium on), 466
Physics of Fluids To be published monthly starting in 1961 (American Institute of Physics), 832
Physics of Mass, Length and Time : An Introduction to the (Prof. Norman Feather), *review* by G. R. Noakes, 183
Physics (Chemical) : Advances in (edited by Prof. I. Prigogine), Vols. 1 and 2, *review* by Prof. C. A. Coulson, 812
Physics (Chemical), Comes of Age, *review* by Prof. C. A. Coulson, 812
Physics (Crystal), at Cambridge, 25
Physics (Health Instrumentation (John S. Handloser), *review* by B. S. Smith, 9
Physics (Marine) : Studies in, *review* by Dr. G. E. R. Deacon, 183
Physics (Mathematical), at Birmingham, 197
Physics (Mathematical) : Manual of (Paul I. Richards), *review* by Prof. R. Eisenschitz, 445
Physics (Nuclear) : 'Memories' for (G. W. Hutchinson), 854
Physics (Nuclear) Instruments : Application of Computer Techniques to (G. G. Scarrott), 854
Physics (Pure and Applied), International Union of : Tenth Annual International Conference on High-Energy Physics, 29
Physics (Semiconductor) : A Source-Book of, *review* by Prof. G. F. J. Garlick, 885
Physics (Solid State) : Covalent Super-Exchange in (Prof. W. S. Fyfe and Prof. J. Verhoogen), 1108
Physics (Theoretical) : Reference Book of, *review* by Prof. R. Eisenschitz, 445
Physics and Chemistry of the Earth (edited by Prof. L. H. Ahrens, Frank Press, Kalervo Rankama and Prof. S. K. Runcorn), Vol. 3, *review* by B. E. Leake, 544
Physics and Design of Semiconductor Devices : The Properties, (John N. Shive), *review* by Dr. J. R. Tillman, 1058
Physiological Action of Rotenone : Mechanism of the (Prof. P. E. Lindahl and K. E. Öberg), 784
Physiological Media for Tissues of *Helix* (C. K. Goddard), 68
Physiological Role of Fast Transfer Reactions (Massachusetts Institute of Technology Seminar Lectures on), 904
Physiological Sciences, International Union of (Section of Pharmacology) : First International Pharmacological Meeting, 29
Physiological Society (Moscow), (U.S.S.R.–Great Britain Society and the) : Joint Meeting to celebrate the centenary of the births of W. M. Bayliss and J. S. Haldane, 912
Physiological Stimulus : Summative Action of Acetylcholine with, on the Generator Potential in the Lateral Eye of the Horseshoe Crab (R. Kikuchi, K. Naito and S. Minagawa), 1118
Physiology at University College, London 371
Physiology in University Education : The Place of (Prof. J. A. B. Gray), 719
Physiology : Plant (edited by F. C. Steward), Vol. 2, Plants in relation to Water and Solutes, *review* by Prof. Walter Stiles, 889
Physiology of Hearing (Prof. W. Burns), 845
Physiology of Marine Animals, *review* by Prof. C. M. Yonge, 630
Physiology of Reproduction : Marshall Chair of the, Cambridge, 113
Physiology (Plant) : A New Treatise on, *review* by Prof. Walter Stiles, 889
Physique (Chimie), Société de : Annual Meeting (Structure, Synthesis and Function of Deoxyribonucleic Acid), 1079
Phytoalexin from *Pisum sativum* L. : Isolation of a (I. A. M. Cruickshank and Dawn R. Perrin), 799
π-Mesonic X-Rays : The Method of Observing (Dr. D. West), 853
Piccotto, Prpf. E., and others : Isotopic Composition and Temperature of Formation of Antarctic Shows, 857
Picric Acid : Interaction of, with Sodium Hydroxide in Water (Takehiro Abe), 234
Pierce, J. A., and others : The 'GBR Experiment'—a Trans-Atlantic Frequency Comparison between Caesium-controlled Oscillators, 914
Pig : A Genetically Determined Enzyme in the (Dr. K.-B. Augustinsson and Dr. B. Olsson), 924
Piganiol, P. : Problems of the Arid Zones, 295
Pigment : Association of, with the Cell Envelope of *Serratia marcescens* (*Chromobacterium prodigiosum*), (Mrs. Purkayastha and Prof. R. P. Williams), 349
Pigment (Beetroot), (Betanin) : Race Differences in the Ability to excrete (Dr. P. H. Saldanha, L. E. Magalhaes and Wanda A. Horta), 806
Pigments (Flavonoid), of *Lathyrus odoratus* (J. B. Harborne), 240
Pileri, Alessandro, and others : Proliferative Capacity of Acute Leukaemia Cells, 611
Pincus, Gregory (edited by) : Hormones and Atherosclerosis—Proceedings of the Conference held in Brighton, Utah, 1958, *review* by Dr. G. S. Boyd, 634
Pineal Gland : Antigonadotropic Function of the, and the Oxytocin of the Neurosecretory Hypothalamic System (Prof. S.-M. Milcou and S. Pavel), 950
Pinene (α-) : Microbiological Transformation of Terpenes—Hydroxylation of (P. K. Bhattacharyya, B. R. Prema, B. D. Kulkarni and S. K. Pradhan), 689
Pinene (α- and β-) : Radiolysis of Terpene Hydrocarbons—Isomerization and Polymerization of (T. H. Bates and Dr. T. Ffrancon Williams), 665
Pirie, Dr. Antoinette, and van Heyningen, Dr. Ruth, : Comparison between the Effects of Cysteine and of Anoxia on the Rate of Mitosis in Lens Epithelium, 947
Pisum sativum L. : Isolation of a Phytoalexin from (I. A. M. Cruickshank and Dawn R. Perrin), 799
Pittsburgh Conference on Analytical Chemistry and Applied Spectroscopy : Twelfth, 289
Pittsbrugh Conference and the Optical Society of America : Symposium on New Frontiers in Optics and Spectroscopy, 289
Pituitary (Human) : Polypeptides of the, with Direct Action on Metabolism (Dr. J. Bornstein and Deirdre Hyde), 125
Pituitary Portal System in Elasmobranchs : Presence of a (Patrick Meurling), 336
Piltdown Skull : Artificial Thickening of Bone and the (Prof. Ashley Montagu), 174 ; (Dr. Kenneth P. Oakley), 174
Place of Physiology in University Education (Prof. J. A. B. Gray), 719
Place (Africa's), in the Emergence of Civilization (Prof. Raymond A. Dart), *review* by M. C. Burkitt, 891
Placenta (Human) : Steroid 11β-ol Dehydrogenase in (Dr. P. A. Osinski), 777
Placental (Human, Term) 17β-Œstradiol Dehydrogenases : Histochemical Localization of—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Plackett, R. L. : Appointed reader in mathematical statistics in the University of Liverpool, 117
Plain Man's Guide to Atomic Energy (P. J. Duncton), 1076
Planas, Prof. Jose, and de Castro, Santo : Serum Iron and Total Iron-binding Capacity in certain Mammals, 1126
Planes of Cleavage : Thermal Conduction in Mica along the (H. J. Goldsmid and A. E. Bowley), 864
Plankton of the Estuary and Offshore Waters of the Sierra Leone River (V. Bainbridge), 557
Plankton (Marine) : Abundance of (R. M. Cassie), 289
Planning for the Changing World Population, *review* by M. K. Milne, 816
Plant (Chemical) Instrumentation—some Notes on the Use of Measuring Instruments (Association of British Chemical Manufacturers), 1079
Plant (Green) : Crystallization of a Photosynthetic Reductase from a (Dr. R. Hill and Fay Bendall), 417
Plant (Rice) : Relative Lengths of Leaf Sheath and Blade with reference to the Developmental Stages of the (Dr. B. Saha), 259
Plant Breeding : The Two R's of, *review* by Dr. G. Haskell, 184
Plant Crop (Host), in Successful Biological Control of Insect Pests : Significance of the Type of (D. C. Lloyd), 430
Plant Design (Nuclear Power) : Evolution of (Sir Christopher Hinton), 1064
Plant Geography : Foundation of, 904
Plant-Growth Activity of α-Alkylphenylacetic Acids and 1,2-Benzo-1-*cyclo*alkene-3-carboxylic Acids (Kazuyoshi Kawazu, Toshio Fujita, Tetsuo Mitsui, Jiro Kato and Masayuki Katsumi), 694
Plant Growth Systems : Ethionine and (R. L. Lowther and W. G. Boll), 832
Plant Hormone Activity—Stilboestrol applied to the Wheat Seedling (Dr. J. J. C. Hinton and Dr. T. Moran), 258
Plant Nutrition : Aspects of, *review* by Prof. Walter Stiles, 815
Plant Pathology in the British Commonwealth (Dr. G. C. Ainsworth), 834
Plant Pathology Laboratory, Harpenden (W. C. Moore), 21
Plant Physiology (edited by F. C. Steward), Vol. 2, Plants in relation to Water and Solutes, *review* by Prof. Walter Stiles, 889
Plant Physiology : A New Treatise on, *review* by Prof. Walter Stiles, 889
Plant Protein : Enzymatic Synthesis of Formylglutamic Acid by a (Ernest H. Byers, Jun., and T. J. Bond), 416
Plant Protoplasts and Vacuoles : A Method for the Isolation of (Dr. E. C. Cocking), 962
Plant Research Centre, Brisbane : The David North (K. T. Glasziou), 745
Plant Tissue (Embryonic) : Stabilization by Manganous Ions of Ribosomes from (Dr. J. W. Lyttleton), 1026
Plant Tissue Cultures, *review* by A. Allsopp, 976
Plant Virus : Activation of One, by Another (B. Kassanis and H. L. Nixon), 713
Plant Viruses : Freeze-drying of (M. Hollings and R. A. Lelliott), 1078
Plant and Equipment (Gas) : Protection of, from Corrosion (Institution of Gas Engineers and the Corrosion Group of the Birmingham and Midlands Section of the Society of Chemical Industry Symposium on), 466
Plant- and Soil- Water Relations : Terminology in (Dr. R. O. Slatyer and Prof. S. A. Taylor), 922
Plantation Crops, Commonwealth Bureau of Horticulture and : Technical Communication No. 25, Abstract Bibliography of Fruit Breeding and Genetics to 1955—*Rubus* and *Ribes*, a Survey (Dr. R. L. Knight and Elizabeth Keep), *review* by Dr. G. Haskell, 184
Plantes : Géographie des (Alexander von Humboldt et A. Bonpland), facsimile edition (Society for the Bibliography of Natural History), 904
Plants : Utilization of Nitrogen and its Compounds by—Symposia of the Society for Experimental Biology, No. 13 (edited by H. K. Porter), *review* by Prof. Walter Stiles, 815
Plants in relation to Water and Solutes (Plant Physiology, edited by F. C. Steward, Vol. 2), *review* by Prof. Walter Stiles, 889
Plants (Australian Native), for Home Gardens (A. E. Brooks), *review* by Dr. R. Melville, 637
Plants (Autotetraploid) : Frequency of Quadrivalents in (Dr. J. W. Morrison and Dr. T. Rajhathy), 528
Plants (Virus-infected) : Possible Occurrence of Interference Systems in (A. D. Thomson), 761
Plants (Woody) : Survival of, at Extremely Low Temperatures (Johnson Parker), 1133 ; (Dr. Akira Sakai), 1134
Plants and Animals : Photoperiodism and related Phenomena in (edited by Robert B. Withrow)—Proceedings of the Conference on Photoperiodism, 1957, sponsored by the Committee on Photobiology of the National Academy of Sciences—National Research Council, supported by the National Science Foundation, *review* by Prof. L. J. Audus, 96
Plants and Bones : Radioactivity of Soils, (Sir Ernest Marsden), 192
Plasma Confinement Geometry : A New (James L. Tuck), 863
Plasma Proteins in Normal Urine (Dr. I. Berggård), 776
Plasma (Human) : Staining for Iodine in Chromatograms of—an Artefact due to Thiourea or Thiouracils (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691 ; *erratum*, 1079
Plasmas (Gaseous) : Diamagnetic Moment of, measured by Spin Resonance Techniques (T. C. Marshall, R. A. Kawcyn and Prof. L. Goldstein), 584
Plaster (Gypsum) : Effect of Temperature on the Expansion on Setting of (P. J. Sereda), 929
Plastic Flow : The Physical Nature of (Dr. J. J. Gilman), 374
Plastically Deformed Metals : A Possible Origin of Exo-Electron Emission in (Dr. A. H. Meleka and W. Barr), 232
Plastics Exhibition : Second International, 559
Plastics Institute : Training Grants for Plastics Technology, 28
  Swinburne Medal awarded to Prof. G. Gee, 740

Plastics Processing : The Technology of (Association for the Advancement of the Knowledge of Materials, the Royal Institute of Engineers, the Royal Netherlands Chemical Federation and the International Union of Pure and Applied Chemistry International Congress on), 559
Plastics Technology : Training Grants for (Plastics Institute), 28
Plastids of the *Avena* Coleoptile (Helen P. Sorokin and Prof. Kenneth V. Thimann), 1038
Platelet-Count Differences in Blood of the Rabbit Right and Left Heart Ventricles (Dr J. George Sharnoff and Dr. Vito Scardino), 334
Pleistocene History of the Irish Sea (G F. Mitchell), 842
Plenderleith, Dr. Harold J : The Enkomi Silver Cup, 1052
Ploidy (Chromosome), and Radiosensitivity of Tumours (László Révész and Ulla Norman), 861
Plumage (Breeding), of the Weaver Finch, *Quelea quelea* : Effects of Whole-body Irradiation on the (Dr. R. Lofts, Prof. A J. Marshall and Prof. J. Rotblat), 615
Plutonium, Neptunium (Uranium, Thorium,) : Crystal Chemistry of Simple Compounds of (E S. Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Podnebi (Atlas) Ceskoslovenské Republiky (Climatic Atlas of the Czechoslovak Republic), *review* by G. A Bull, 543
Poisoning (Experimental), by Cadmium and other Metals : An Abnormal Serum Protein in (D. J. Lawford), 946
Poisoning (Liver) Levels of Pyridine Nucleotides in (Dr. C. H. Gallagher and Dr K R Rees), 148
Poisoning (Potassium Cyanide) : Effect of, on the γ-Aminobutyric Acid-Level in the Brain (Dr. T Tursky), 322
Polar Research in the U S.S.R , 287
Polarization : Interstellar Extinction and (R. Wilson), 288
Polarization (Anodal) · Restoration of Membrane Excitability of Calcium-deficient Muscles by (Prof. K. Koketsu and K. Noda), 243
Polarographic Determination of the Lanthanides : Use of Azo Dyestuffs for the (T. M Florence and L E. Smythe), 771
Pole (South) Observations of 'Whistlers' and 'Chorus' at the (Dr. L. H. Martin), 1018
Policy (Book-buying), of the National Central Library (S P. L. Filon), 992
Policy (British Agricultural) : Principles for—a Study sponsored by the Nuffield Foundation (edited by H T. Williams), *review* by Sir John Russell, 721
Policy (Monetary), in England . Monetary Thought and (Prof. R. S Sayers), 844
Policy (Population) : Population Growth, Fertility and (Prof. D. V. Glass), 849
Pollen Germination in some Gramineae—*Pennisetum typhoideum* (Dr. I. K. Vasil), 1134
Polley, D. · At the second Annual Conference of the British Computer Society (Installation of Data-processing Schemes for Insurance Records), 656
Polluted Waters The Biology of (Dr H B N Hynes), *review* by Dr. G C. Ware, 1061
Pollution Biology of, *review* by Dr. G C Ware, 1061
  The Effects of, on Living Material (edited by W. B. Yapp), *review* by Dr G. C Ware, 1061
Polonium-210 in Grass · Lead-210 and (C. R Hill), 211
Polson, Alfred : Viscosity Increments of Non-Ionized Molecules, 482
Polwarth Wools (Merino and) · Abnormal Crimping in (R. E. Chapman, B. F Short and P. G. Hyland), 960
Poly-β-benzyl-L-aspartate Screw Sense of the α-Helix in (E. M. Bradbury, A. R Downie, Dr. A. Elliott and W. E. Hanby), 321
Polychaete Family Longosomidae in New Zealand (Prof. G. A. Knox), 1131
Polychaete Fauna of South Africa (Prof J. H Day), Part 5, 199
Polychaetes (Pelagic), of the South Atlantic (N. Tebble), 289
Polyenoic Acid in Hypercholesterolaemia induced by Pyridoxine Deficiency in Rats (Ajit Goswami and Prof. D P. Sadhu), 786
Polyglycosidases Steric Factors affecting the Specificity of (F W Parrish and A. S. Perlin), 1110
Polymer Science : Colloid and (Seminar at University College, London, on), 378
Polymer (High) Forum · Tenth Canadian (National Research Council of Canada and the Chemical Institute of Canada), 117
Polymerization of α- and β-Pinene Radiolysis of Terpene Hydrocarbons—Isomerization and (T. H. Bates and Dr. T. Ffrancon Williams), 665
Polymerization (Vapour-Phase), of Methyl Acrylate : Generation of Aerosols by (R Pearson and G. Langer), 235
Polymers : High-Temperature Resistance and Thermal Degradation of (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 466
  Rheology of (British Society of Rheology Discussion on), 290
Polymers (Thermosetting) . Dependence on Temperature of the Electrical Resistivity of (R W Warfield and M. C Petree), 316
Polymorphism (β-Globulin), in Chimpanzees (Prof. Samuel H. Boyer and Dr. William J. Young), 1035
Polyoma Virus : Production of Tumours in *Rattus* (*Mastomys*) *natalensis* by (Dr Alan S. Rabson, William J. Branigan and Frances Y. Legallais), 423
Polyoma Virus Mutant with a Reduction in Tumour Formation (Dr Leo Sachs and Dan Medina), 715
Polypeptides of the Human Pituitary with Direct Action on Metabolism (Dr J Bornstein and Deirdre Hyde), 125
Polyphenol Oxidase Activity of *Nicotiana glutinosa* Leaves infected with Tobacco Mosaic Virus (Dr Masatake Kikuchi and Akira Yamaguchi), 1048
Polyploidizing Principle in the Spleen (I. Bouvier, Prof R. Rigler and W. Rosenkranz), 965
Polyploidy in Human Tumours (N B Atkin and Angela J. Ross), 579
Polysaccharide (Starch-like), of *Streptococcus pyogenes* (Dr. H Baum and Dr. N Crowley), 413
Polystyrene (Isotactic) · Homogeneous Synthesis of, using *n*-Butyllithium Initiator (Dr. R. J. Kern), 410
Polyvalent Immunological Tolerance in Homologous Radiation Chimaeras (Alena Lengerová), 160
Pople, J. A., and others : High-resolution Nuclear Magnetic Resonance, *review* by Dr. L M Jackman, 358
Population (American), of the Shore Crab, *Carcinus maenas* (L.) : Albinism in an (Anthony J Provenzano, jun), 521
Population (Bacterial), of the Nose and Skin (H. William Smith and W. E. Crabb), 288
Population (Swedish Rural) · A Clinical and Genetico-Statistical Study of Schizophrenia and Low-Grade Mental Deficiency in a Large (Bertil Hallgren and Torsten Sjogren, 291
Population (World) . Planning for the Changing, *review* by M. K. Milne, 816
Population Growth, Fertility and Population Policy (Prof D. V. Glass), 849
Population Policy : Population Growth, Fertility and (Prof D. V. Glass), 849
Population Studies : Earthworm—a Comparison of Sampling Methods (F. Raw), 257
Population Trends among Hawks and Owls in Illinois (Richard R Graber and Jack S. Golden), 999
Population Variances may be Unequal : Significance of the Difference between Two Means when the (John B. de V. Weir), 438
Pore Radius (Equivalent), of Kidney Slices from *Necturus* . Effect of Anti-Diuretic Hormone and Calcium on the (G Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Porphyrin (Halogenated), in Mouse Tumours : Localization of a (K. I. Altman and Prof. K. Salomon), 1124
Portal System (Pituitary), in Elasmobranchs Presence of a (Patrick Meurling), 336
Porter, H. K. (edited by) . Utilization of Nitrogen and its Compounds by Plants—Symposia of the Society for Experimental Biology, No. 13, *review* by Prof. Walter Stiles, 815
Porter, R. R (Press, Elizabeth M , and) : N-Terminal Amino-Acids of Bovine Antibody, 59
Position (The Present), of Leather Science, *review* by Prof. A G. Ward, 724
Position (Systematic), of the Australian Brown Alga, *Notheia anomala* : Structure and (M. Nizamuddin and Dr. H. B S. Womersley), 673
Positions of Thorium and Uranium in the Periodic Table (Dr A. E. Dwight), 505
Possibilities (Technical), of a Thames Flood Barrier, 294
Possibility of Detecting Ionospheric Drifts from the Occurrence of Spread F Echoes at Low Latitudes (R. W Knecht), 927
Possible Discovery of Ion-Pairs by Interferometry (Prof. R. N. O'Brien and C. Rosenfeld), 935
Possible Means of Predicting the Nitrogen-supplying Power of Soils : Ammonia released on Treating Soils with *N* Sodium Hydroxide as a (A. H. Cornfield), 260
Possible Occurrence of Interference Systems in Virus-infected Plants (A. D. Thomson), 761
Possible Origin of Exo-Electron Emission in Plastically Deformed Metals (Dr A H Meleka and W Barr), 232
Post Office (General) . Appointment of Dr. R. L Smith-Rose as chairman of the Frequency Advisory Committee, 466
Postgraduate Course on Recent Advances in Steroid Chemistry (Kingston Technical College), 905
Potash in Wet and Dry Soils, *review* by Dr. P. W. Arnold, 976
Potash Institute (International) : Potassium Symposium, 1958—Twelve Papers read at the Fifth Congress, *review* by Dr. P W. Arnold, 976
Potassium Symposium, 1958—Twelve Papers read at the Fifth Congress of the International Potash Institute, *review* by Dr. P. W. Arnold, 976
Potassium Symposium (Japanese)—Nine Papers read at the First Japanese Symposium, 1957, *review* by Dr. P. W Arnold, 976
Potassium in Mitochondrial Membrane Fractions : Sodium and (Dr. Frank Ulrich), 949
Potassium-supplying Power of some British Soils (Dr. P W. Arnold), 436
Potassium-Argon Ages of some Rocks from the South Atlantic (John A. Miller), 1019
Potassium Cyanide Poisoning Effect of, on the γ-Aminobutyric Acid-Level in the Brain (Dr. T Tursky), 322
Potassium Gibberellate : Effect of Autumn Applications of, on Fruit Production of the Strawberry (Prof Carter R Smith), 620
Potassium Tolerance Tests in South Indian People (Dr J. G. Henrotte, G. Krishnamurthi and G. Ranganathan), 328
Potassium Transport . A Bacterial Mutant with Impaired (Dr. Stanley G. Schultz and Dr A K. Solomon), 802
$K_2Ti_2O_5$: Five Co-ordinated Titanium in (Dr. Sten Andersson and Dr. A. D Wadsley), 499
Potato Research, European Association for Series of Triennial Conferences, 466
Potatoes : Determination of Nonanol Residues in (W. F. van Vliet and W. H Schriemer), 235
Potatoes stored in the Cold and at Room Temperature Biosynthesis of Sucrose by Preparations from (Dr Sigmund Schwimmer and Edward S Rorem), 1113
Potency (Haematopoietic), of Liver of Mice fed on a Meat Diet : Lack of (Judith Ilan and Prof K. Guggenheim), 698
Potent New Benzothiadiazine Diuretic (Dr. Richard M. Taylor and Martin M. Winbury), 603
Potential (Earth's Gravitational) : Evaluation of the Second, Fourth and Sixth Harmonics in the (D G King-Hele), 490
Potential (Galactic Gravitational) · Gravitational Red Shift of Hydrogen 21-cm Radiation as a Method to measure (L. F Landovitz and L. Marshall), 223
Potential (Generator), in the Lateral Eye of the Horseshoe Crab · Summative Action of Acetylcholine with Physiological Stimulus on the (R. Kikuchi, K Naito and S. Minagawa), 1118
Potential (The Membrane), of the Anterior Byssus Retractor Muscle of *Mytilus edulis* (Dr D. H. Paul), 1121
Potentialities . Human (Dr Gardner Murphy), *review* by Dr D J. West, 270
Potentiation of Contractility in the Heart Muscle of the Rat and some other Mammals (Dr V. Kruta and Dr P Braveny), 327
Potentiation of Hair-Growth by Ultra-Violet Light (B. E. Johnson), 159
Potentiometric Study of Priming Paints for Metal (Dr N R Bharucha), 756
Potter, B J. : Use of Diodone in Renal Studies in Sheep, 698
Poultry Science (British), Vol. 1, No 1, 465
Powell, Dr. D. W : Stress-Dependent Magnetization in some Quartz-Dolerites, 225
Power in Great Britain : Output of, 557
Power : Nuclear (Ministry of Power Programme), 1055
  Understanding and, 809

Power, Ministry of : The Nuclear Power Programme, 1055
  Capital Investment in the Coal, Electricity and Gas Industries, 1055
  Safety in Mines Research Establishment Bibliography, 1960 (compiled by E. B. Smith), second edition, *review* by Prof. S. G. Ward, 1063
Power (Fuel and) : Advisory Council for Research and Development in, 286
Power (Nitrogen-supplying), of Soils : Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of Predicting the (A. H. Cornfield), 260
Power Plant Design (Nuclear) : Evolution of (Sir Christopher Hinton), 1064
Practical Vertebrate Morphology : A Manual of (J. T. Saunders and Dr. S. M. Manton), third edition, *review* by Dr. N. B. Marshall, 9
Practice : Ferrimagnetism in Theory and, *review* by Dr. G. E. Bacon, 974
Practice of Television Engineering : Principles and, *review* by Dr. R. L. Smith-Rose, 358
Practice (Laboratory) : The Anti-Globulin (Coombs) Test in (Dr. L. Dunsford and Jean Grant), *review* by Dr. R. Drummond, 357
Pradhan, S. K., and others : Microbiological Transformation of Terpenes—Hydroxylation of α-Pinene, 689
Pre-cancerous Mouse Skin : Mast Cells and 5-Hydroxytryptamine in (Dr. R. E. Coupland and Dr. J. F. Riley), 1128
Pre-Natal Growth in Mammals Control of (Dr. Anne McLaren and Dr. Donald Michie), 363
Precipitating Components in Sera from Pregnant Women : Immuno-electrophoretic Demonstration of (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
Precipitation (Differential), of Nucleic Acids from Aqueous Solutions : A New Method for the (William G. Aldridge), 323
Precipitation Processes in Steels—Report of a Conference held in the University of Sheffield, 1958, *review* by Prof. F. C. Thompson, 9
Precipitins from *Ricinus communis* Seeds : Anti-Pneumococcus Type XIV Activity of (Lieut.-Col. G. W. G. Bird), 415
Precision Intercomparisons of Lead Isotope Ratios—Broken Hill and Mount Isa (F. Koller, Prof. R. D. Russell and T. J. Ulrych), 754
Predicting the Nitrogen-supplying Power of Soils : Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of (A. H. Cornfield), 260
Preference (Taste), in the Monkey : Effects of Medial Temporal Lesions on (Dr. L. Weiskrantz), 879
Pregnant Rabbit : Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a, for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Pregnant Women : Immuno-electrophoretic Demonstration of Precipitating Components in Sera from (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
  Inhibition of Glucuronosyl Transferase by Progestational Agents from Serum of (Dr. David Yi-Yung Hsia, Robert M. Dowben, Ralph Shaw and Aaron Grossman), 693
Prehistoric India, *review* by M. C. Burkitt, 94
Prehistoric Man in Europe (Frank C. Hibben), *review* by M. C. Burkitt, 729
Prehistory : North African, *review* by M. C. Burkitt, 1062
Preliminary Analysis of some International Geophysical Year Observations : Distribution of Atmospheric Ozone—a (J. MacDowall), 382
Preliminary Psychomotor Stress Studies with Subnormal Psychopathic Subjects (Dr. J. E. Tong, I. C. Murphy and F. R. Adams), 172
Prema, B. R., and others : Microbiological Transformation of Terpenes—Hydroxylation of α-Pinene, 689
Premature Neonatal Humans : Delayed-type Hypersensitivity in (Jonathan W. Uhr, Joseph Dancis and Charlotte Grantz Neumann), 1130
Preparation of Active Cellular Fractions : Homotransplant Antigens—(L. T. Mann, jun., J. M. Corson and Prof. G. J. Dammin), 774
Preparation and Use of Case Studies : Research Necessary for the (South London Committee of the British Institute of Management Conference on), 660
Preparations from Potatoes stored in the Cold and at Room Temperature : Biosynthesis of Sucrose by (Dr. Sigmund Schwimmer and Edward S. Rorem), 1113
Preparations (Pharmaceutical) : Classification of—a Survey of Existing Legislation (World Health Organization of United Nations), 287
Preparing Figures : Oceanography of Long Island Sound—Guide for (Y. H. Olsen and James E. Morrow, Jr.), 123
Presence of Chloramphenicol : Recovery in the, of *Escherichia coli* B (H) Irradiated with Ultra-violet Light (Kenshi Suzuki and Yukiko Iwama), 347
Presence of Immunologically Active Fragments after Proteolytic Degradation of Human γ-Globulin (L. A. Hanson and B. G. Johansson), 599
Presence of Neutral Carbohydrates in Human Aortic Tissue (Dr. Sv. Bertelsen), 411
Presence of a Pituitary Portal System in Elasmobranchs (Patrick Meurling), 336
Present Position of Leather Science, *review* by Prof. A. G. Ward, 724
Preservation of the Countryside (Council for the Preservation of Rural England twenty-first National Conference for the), 559
Preservation of Films of Historical Value, 199
Preservation of Rural England, Council for the : Twenty-first National Conference for the Preservation of the Countryside, 559
Preservation (Bird), International Council for : Annual Report for 1959, 287
Press, Elizabeth M., and Porter, R. R. : N-Terminal Amino-Acids of Bovine Antibody, 59
Press, Frank, and others (edited by) : Physics and Chemistry of the Earth, Vol. 3, *review* by B. E. Leake, 544
Press, J. J. (edited by) : Man-Made Textile Encyclopedia, *review* by Prof. C. S. Whewell, 2
Pressure (High) Chemical Plant : The Design and Construction of (Harold Tongue), second edition, *review* by Dr. K. E. Bett, 541
Pressure (High-) Forms of Ice—Ice-III : Crystal Structures of the (Prof. W. Barclay Kamb and Sankar K. Datta), 140
Pressure (High-) Technology, *review* by Dr. K. E. Bett, 541
Prestarved *Escherichia coli* : Capacity of Extracts from, to Incorporate Thymidine into Deoxyribonucleic Acid (Dr. Daniel Billen), 1044
Pretreatment with Reserpine : Influence on the Effect of Vasoconstrictor Amines by (H. C. Sabelli), 784
Prevention : Decay of Timber and its (K. St. G. Cartwright and W. P. K. Findlay), *review* by Prof. F. W. Jane, 977
Prevention and Artificial Induction of the Imaginal Diapause in *Coccinella 7-punctata* L. (I. Hodek and J. Cerkasov), 345
Price, Dr. J. R. : The Chemistry of Natural Products (Australian Natural Product Research), 1080
Price, Shirley A. P., and others : An Unidentified Pharmacologically Active Substance extracted from Cerebral Hemispheres, 420
Priestley, Dr. C. H. B. : Turbulent Transfer in the Lower Atmosphere, *review* by Prof. P. A. Sheppard, 974
Prigogine, Prof. I. (edited by) : Advances in Chemical Physics, Vols. 1 and 2, *review* by Prof. C. A. Coulson, 812
'Primary' Effects (Delayed), in *Chara vulgaris* L. subjected to X-Rays (C. M. Gillet), 874
Primary Species in the Radiolysis of Aqueous Solutions : Effects of *p*H and the Nature of the (J. T. Allan and Dr. G. Scholes), 218
Primary Tuberculous Infection : Effect of a, on the Resistance of Male and Female Mice to Ectromelia (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Primates : The Jaws and Teeth of (W. Warwick James), *review* by Sir Wilfrid Le Gros Clark, 891
Priming Paints for Metal : Potentiometric Study of (Dr. N. R. Bharucha), 756
Primitive Mythology : The Masks of God— (Dr. Joseph Campbell), *review* by Dr. K. O. L. Burridge, 7
Principle (Frog Water-Balance), and Arginine Vasotocin : Evidence for the Identity of Natriferin, the (Prof. Wilbur H. Sawyer), 1030
Principle (New), in Weaving, 27
Principle (A Polyploidizing), in the Spleen (L. Bouvier, Prof. R. Rigler and W. Rosenkranz), 965
Principles for British Agricultural Policy—a Study sponsored by the Nuffield Foundation (edited by H. T. Williams), *review* by Sir John Russell, 721
Principles of Sugar Technology (edited by Pieter Honig), Vol. 2, Crystallization, *review* by H. C. S. de Whalley, 979
Principles and Practice of Television Engineering, *review* by Dr. R. L. Smith-Rose, 358
Prins-van der Meulen, P. Y. F., and Schuringa, G. J. : Evidence for Multiple Nature of Cellulase of *Myrothecium verrucaria*, 695
Pritchard, J. P. : The Development of Pulp and Particle Board Industries and their Effect on Forest Management (Prospects of Greater Demand from the Furniture Industry), 33
Proactivator Activity : Isolation of Material with, from Human Serum (H. B. W. Greig and Elsie M. Cornelius), 1125
Probability and Physics, *review* by Prof. M. S. Bartlett, 1060
Probability and related Topics in Physical Sciences (Prof. Mark Kac), *review* by Prof. M. S. Bartlett, 1060
Probable Functions of Betaine Esters in Brain Metabolism : Isolation and (Prof. E. A. Hosein and Peter Proulx), 321
Problem of the 'Abominable Snowman' (S. V. Obruchev), 558
Problem (Cyprus) : Land Use and the, *review* by Prof. M. J. Wise, 628
Problem (Neglected) : Suicide—a, 207
Problems of the Arid Zones (Unesco Symposium on), 295
Problems of Radioactivity at Water and Sewage Works (Manchester College of Science and Technology Course of Lectures on), 743
Problems of Visual Discrimination (Prof. R. W. Ditchburn), 854
Problems (Boundary), in Differential Equations—Proceedings of a Symposium conducted by the Mathematics Research Center of the United States Army at the University of Wisconsin, 1959 (edited by Prof. Rudolph E. Langer), *review* by Prof. E. T. Copson, 451
Problems (Engineering) : Unification of Analytical Approaches to, *review* by Prof. J. Greig, 359
Problems (Non-Linear) : A Study of, *review* by K. Krickeberg, 727
Problems (Nonlinear), in Random Theory (Prof. Norbert Wiener), *review* by K. Krickeberg, 727
Problems (Trained Manpower) : The Public Service in New States—a Study of some (Kenneth Younger), 971
Problems (Weather), in Agriculture (Royal Meteorological Society Summer Meeting), 995
Process of Development : Shortages of Scientific Personnel in European Countries in, 565
Process (Cucumber Mosaic Virus Infection) : Direct Infra-Red Spectral Analysis of the (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Processes : Ecological (Dr. Alan Mozley), *review* by W. H. Dowdeswell, 451
  Redox (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 650
Processes (Metabolic) : Role of Initial Value of, in Oxygen Consumption Changes in Rats during Irradiation (Dr. A. Vacek), 76
Processes (Precipitation), in Steels—Report of a Conference held in the University of Sheffield, 1958, *review* by Prof. F. C. Thompson, 9
Processing (Information) Societies, International Federation of : Formation of an, 655
Processing (Plastics) : The Technology of (Association for the Advancement of the Knowledge of Materials, the Royal Institute of Engineers, the Royal Netherlands Chemical Federation and the International Union of Pure and Applied Chemistry International Congress on), 559
Procházka, Dr. Z., and others : Biogenesis of Ascorbigen, 3-Indolylacetonitrile and Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in *Brassica oleracea* L., 61
Procter Memorial Lecture of the Society of Leather Trades Chemists : Ninth (Prof. W. T. Astbury), 905
Proctor, B. A. : Strengths of Acid-etched Glass Rods, 492
Product (Fission), and Beryllium-7 Concentrations in the Atmosphere : Comparison of (W. Anderson, R. E. Bentley, R. P. Parker, J. O. Crookall and L. K. Burton), 550
Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Production of Muscular Weakness in Rats by a Creatine Analogue (Coy D. Fitch and Prof. James S. Dinning), 421
Production of Tuberculin Sensitivity (Prof. Hubert Bloch and Albert A. Nordin), 434
Production of Tumours in *Rattus (Mastomys) natalensis* by Polyoma Virus (Dr. Alan S. Rabson, William J. Branigan and Frances Y. Legallais), 423
Production (Food and Animal) : Overseas (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 1070

Production (Fruit), of the Strawberry : Effect of Autumn Applications of Potassium Gibberellate on (Prof. Carter R. Smith), 620
Production (Gas), of Sensitive and Resistant L1210 Mouse Leukaemia Cells : Effect of 6-Mercaptopurine on the Net *in vitro* (Dr. H. J. Woodliff), 156
Productivity (Grassland) : The Measurement of—Proceedings of the University of Nottingham Sixth Easter School in Agricultural Science, 1959 (edited by Prof. J. D. Ivins), *review* by Dr. G. W. Cooke, 544
Products . Flat Rolled—Rolling and Treatment (edited by T. E. Dancy and E. L. Robinson), *review* by Prof. F. C. Thompson, 273
Products of the Rare Earth Groups (Johnson, Matthey and Co., Ltd.), 832
Products (Meat) : The Science of Meat and (Members of the Research Staff of the American Meat Institute Foundation), *review* by Prof. J. Hawthorn, 888
Products (Natural) : The Chemistry of (Symposium on, sponsored by the International Union of Pure and Applied Chemistry, organized by the Australian Academy of Science), 1080
Products (Pharmaceutical) · Use of Gamma-Radiation Sources for the Sterilization of (Report of the Association of the British Pharmaceutical Industry), 903
Professional Radio and Electronics Engineers : Education and Training of (British Institution of Radio Engineers Report on), 115
Profile (Soil) : C Horizon of the (Dr. S. G. Willimott and D. W. Gilchrist Shirlaw), 966
Progestational Agents from Serum of Pregnant Women · Inhibition of Glucuronosyl Transferase by (Dr David Yi-Yung Hsia, Robert M. Dowben, Ralph Shaw and Aaron Grossman), 693
Programming Programme for the BESM Computer (A. P. Ershov), translated from the Russian by M. Nadler, edited by J. P. Cleave, *review* by R. J. Ord Smith, 92
Programming (Automatic), in the U.S S.R., *review* by R. J. Ord Smith, 92
Progress in the Endocrinology of Reproduction : Recent—Proceedings of the Conference held in Syracuse, 1958, *review* by Prof P L. Krohn, 5
Progress in English Education : Sixty Years of (Prof. H. C. Dent), 848
Progress in Inorganic Chemistry (edited by F. Albert Cotton), Vol. I, *review* by Dr. I. R. Beattie, 4
Progress in Nuclear Science, *review* by Dr. E. B. Paul, 182
Progress of Science Abroad : The Royal Society and the (Prof. R. J. Forbes), 100
Progress in Semiconductors (edited by Dr. Alan F. Gibson, Prof R. E. Burgess and Dr. F A. Kroger), Vol. 4, *review* by Dr. J. R. Tillman, 185
Progress (Economic) . The Conditions of (Colin Clark), 537
Progress (Man's Technological), from Steam Engine to Satellite Science as History—the Story of (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J. L. Stollery, 8
Progress (Research), in General Medical Sciences, 1959 : Highlights of (United States Department of Health, Education and Welfare, Publication No. 739), 200
Projection (Stereographic) : Use of, in Structural Geology (Dr. F. C. Phillips), second edition, *review* by John Sutton, 729
Proliferative Capacity of Acute Leukaemia Cells (Dr. Felice Gavosto, Giovanni Maraini and Alessandro Pileri), 611
Propagate a Fatigue Crack in Mild Steel : Correlation of the Alternating Stresses required to Initiate and (N. E. Frost), 233
Propagation (Ionospheric), of Electromagnetic Waves, *review* by Sir Harrie Massey, 810
Properties of the Two-Neuron Arc (Hind-Limb Reflexes in the Kitten), (Dr. Stan Skoglund), 134
Properties (Biological) : Synthesis and, of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin (E. D Nicolaides, H. A. DeWald, Patricia G. Shorley and Dr H. O J Collier), 773
Properties (Chemical and Physical), of the Small Deoxyribonucleic Acid Component of Crystalline Cytochrome b_5 (Dr. M. D. Montague and Prof R K. Morton), 916
Properties (Magnetic), of Tektites and Glasses formed by Fusion of Terrestrial Rocks . Comparison of the Chemical Composition and (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Properties (Scattering), of the Moon : Radar Determination of the (Dr. Fred B Daniels), 399
Properties, Physics and Design of Semiconductor Devices (John N Shive), *review* by Dr. J. R Tillman, 1058
Property (Industrial), International Association for the Protection of : Twenty-fourth Congress (H. C. Miller), 202
Proportion of Noradrenaline to Adrenaline in the Adrenal Glands of Littermate Cats (Dr K. R Butterworth and Dr Monica Mann), 785
Proposal (New) . Valance-Bond Structures—a (Dr J. W. Linnett), 859
Proposals for Space Flight, *review* by D G. King-Hele, 811
Proprioceptive Hind-Limb Reflexes : Velocity of Conduction and Spinal Transmission of (Hind-Limb Reflexes in the Kitten), (Dr. Stan Skoglund), 132
Propulsion Combustion and (AGARD fourth Colloquium on—High Mach Number Air-breathing Engines), 18
6-*n*-Propylthiouracil : Differential Reactivity of Saliva from 'Tasters' and 'Non-Tasters' of (Frances Griffin and Prof. Roland Fischer), 417
Prosser, G. S. (Patrick, Dr C. R., and) : A Molecular Complex of Benzene and Hexafluorobenzene, 1021
Prostato-vesiculitis (Chronic) . Urinary Excretion of Œstrogens in Cases of (Prof. Gunnar Nylander), 154
Protandry and Self-Fertilization in the Calyptraeidae (Dr H. V. Wyatt), 520
Processes : Enzymatic Activation of a Hormone-like Response in *Hydra* by (Dr. Howard M. Lenhoff and John Bovaird), 671
Protection of Gas Plant and Equipment from Corrosion (Institution of Gas Engineers and the Corrosion Group of the Birmingham and Midlands Section of the Society of Chemical Industry Symposium on), 466
Protection of Industrial Property, International Association for the : Twenty-fourth Congress (H. C. Miller), 202
Protection against Liver Injury due to Murine Hepatitis Virus (Dr. J. D. Judah, G Bjotvedt and T. Vainio), 507
Protection against Tidal Flooding in London (N. B. Webber) 293
Protective Effect of Cysteine against Retinal Degeneration induced by Iodate and Iodoacetate (Prof. Arnold Sorsby and Ronald Harding), 608
Protein : Incorporation of Acetate into, by Obligately Parasitic and Saprophytic Fungi (Dr. Richard C. Staples and Dr. H. P. Burchfield), 1040
  Microbial Synthesis of, in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the Test Organism (Maharani Chakravorty), 239
Protein (An Abnormal Serum), in Experimental Poisoning by Cadmium and other Metals (D. J. Lawford), 946
Protein (Plant) : Enzymatic Synthesis of Formylglutamic Acid by a (Ernest H. Byers, Jun., and T. J Bond), 416
Protein (Tobacco Mosaic Virus) : A Difference between the Sub-Units of ? (Dr H G. Aach), 75
Protein Content : Urinary Amino-Acid Pattern of Cats on Diets of varying (Dr. J. P. Greaves and Dr. Patricia P. Scott), 242
Protein Synthesis . Cytoplasmic Particles and their Role in (Colloid and Biophysics Committee of the Faraday Society Informal Discussion on), 643
Protein Synthesis (Optimal), by Ascites Tumour Cells *in vitro* (Dr. M. J. Fraser), 1114
Protein-bound Aminoazo Dyes : Distribution of, in the Rat Liver Microsome (Dr T. Yamada, M. Matsumoto, S. Kanda and Prof. H. Terayama), 943
Proteins : Transiodination of, during Enzymic De-iodination of Thyroxine (Dr. J R. Tata), 1025
Proteins in Deuterium Oxide : Ultra-violet Absorption Spectra of (Dr. Shiro Takashima), 597
Proteins (Cornea) : Infra-red Examination of the Association of, with Water (Dr S. Bakerman and C. Mitchell), 1033
Proteins (The Plasma), in Normal Urine (Dr. L Berggård), 776
Proteins (Wheat) Starch-Gel Electrophoresis of (Dr. G. A. H. Elton and J. A. D. Ewart), 600
Proteolytic Degradation of Human γ-Globulin : Presence of Immunologically Active Fragments after (L. A. Hanson and B. G. Johansson), 599
Proteolytic Enzyme from *Bacillus subtilis* : Amino-Acid Sequence about the Reactive Serine of a (Dr. F. Sanger and D. C. Shaw), 872
Proterozoic in the U S.S.R., 742
Proton Magnetic Resonance Spectroscopy : Structure Determination with the Help of (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely, Dr R. F. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Protoplasts (Plant), and Vacuoles : A Method for the Isolation of (Dr. E. C. Cocking), 962
Protozoa (Rumen Oligotrich): Effect of Penicillin on the Maintenance of (G. S. Coleman), 518
Proulx, Peter (Hosein, Prof. E. A., and) : Isolation and Probable Functions of Betaine Esters in Brain Metabolism, 321
Provenzano, jun., Anthony J. . Albinism in an American Population of the Shore Crab, *Carcinus maenas* (L.), 521
Provisional Embryonic Cuticle of a Lepidopteran : Occurrence and Function of the (Dr. R. K. Sharan), 1040
Pruthi, J. S. (Rao, B A. S., and) . An Acid-tolerant and Non-sporulating Yeast from Passion Fruit Juice, 342
Pseudocoelomic Membranes of *Ascaris lumbricoides* : Use of Collagenase in the Characterization of (Barbara Dawson), 798
Pseudomonad : A Growth Factor for *Haemophilus* Species secreted by a (Moshe Shifrine and Prof Ernst L. Biberstein), 623
Pseudomonas Species · Egg-Yolk Reactions of (Dr. A. T. Willis and G. Gowland), 432
Psychiatry : Existential, *review* by Dr. Clifford Allen, 1062
Psychiatry, Korsakov Journal of Neuropathology and : English translation of, 649
Psychoanalysis and Medicine : The Wish to Fall Ill—a Study of (Dr. Karin Stephen), *review* by Dr. Clifford Allen, 978
Psychology at Leicester, 901
Psychology . Experiment in—a Centenary and an Outlook (Prof R. C. Oldfield), 846
Psychomotor Stress Studies with Subnormal Psychopathic Subjects : Preliminary (Dr. J. E. Tong, I. C Murphy and F R Adams), 172
Psychopathic Subjects (Subnormal) : Preliminary Psychomotor Stress Studies with (Dr. J E. Tong, I C. Murphy and F. R. Adams), 172
Pteridological Society (British) : Work of the, 902
Pterin Synthesis in the Amphibian Neural Crest Cell (Tadao Hama and Masataka Obika), 326
Public : Science and the, 371
Public Service in New States : The—a Study in some Trained Manpower Problems (Kenneth Younger), 971
Publications : Cost of Scientific Periodical (Capt L. R. Maxwell), 1052
Publications (Indian Scientific and Technical) Bibliography of (Council of Scientific and Industrial Research, New Delhi), 199
Publications (Russian Biological) . Translations of (American Institute of Biological Sciences), 558
Publications (Scientific) Council : Discussion on the Influence of Editors, 120
Published Books : United States Record of, 116
Pugh, Sir William . Triassic Salt—Discoveries in the Cheshire–Shropshire Basin, 278
Pugsley, Sir Alfred : Statics and the Engineer (Presidential Address to Section G (Engineering) of the British Association for the Advancement of Science), 844
Pulp and Board Industries in Britain : Scope for Expanding (J. J MacGregor), 32
Pulp and Particle Board Industries : The Development of, and their Effect on Forest Management (Society of Foresters of Great Britain Discussion on), 32
Pulse-shortening in Electron Linear Accelerators (M. G. Kelliher and R. Beadle), 1099
Pump Fluids for Higher Vacuums (Kenneth Hickman), 405
Pupal Mortality (Late Larval and), in the Wild · Radioactive Labelling of Lepidopterous Larvae—a Method of estimating (L. M Cook and Dr H. B. D. Kettlewell), 301
Pupil : Effect of Size of, on Visual Acuity (Dr. F. W. Campbell and Dr. A. H. Gregory), 1121
Purchase, I F. H. Awarded a Research Training Scholarship by the Animal Health Trust, 904
Pure Lines of Rice : Secondary Selection in (T. K. Van), 169
Pure Rotational Absorption of Ozone in the Region 125-500 Microns (Dr. H. A. Gebbie, N. W. B. Stone and C. D. Walshaw), 765

Pure Water: Changes in Conductivity of, caused by X-Irradiation (K. Schmidt), 931
Pure and Applied Chemistry (International Union of Pure and Applied Chemistry Seventeenth International Congress of), 29, *erratum*, 117
Pure and Applied Chemistry, International Union of: Seventeenth International Congress of Pure and Applied Chemistry, 29, *erratum*, 117
Pure and Applied Chemistry, International Union of (sponsored by the): Symposium on the Chemistry of Natural Products (organized by the Australian Academy of Science), 1080
Pure and Applied Chemistry, International Union of, and others: International Congress on the Technology of Plastics Processing, 559
Pure and Applied Physics, International Union of: Tenth Annual International Conference on High-Energy Physics, 29
Purified Human Growth Hormone: Immunoelectrophoretic Studies on (Dr. Jan Hirschfeld, Carl-Axel Gemzell and Leif Wide), 64
Purkayastha, Mira, and Williams, Prof. R. P.: Association of Pigment with the Cell Envelope of *Serratia marcescens* (*Chromobacterium prodigiosum*), 349
Pursuit of World Health: In, *review* by Christine Cockburn, 722
Purver, Margery, and Bowen, Dr. E. J.: The Beginning of the Royal Society, *review* by Dr. William P. D. Wightman, 356
Pusey, J. G.: Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Botany), 742
Pyridine Nucleotides in Liver Poisoning: Levels of (Dr. C. H. Gallagher and Dr. K. R. Rees), 148
Pyridoxine Deficiency in Rats: Polyenoic Acid in Hypercholesterolaemia induced by (Ajit Goswami and Prof. D. P. Sadhu), 786
Pyrosoma: Occurrence of, on the Continental Slope (P. J. Whitehead), 878
Pyruvate: Effect of, upon Nucleated and Enucleated Fragments of *Amoeba proteus* (Dr. Edmund Guttes and Sophie Guttes), 432

QUADRIVALENTS in Autotetraploid Plants: Frequency of (Dr. J. W. Morrison and Dr. T. Rajhathy), 528
Quaglino, Dennis, and Hayhoe, Dr. F. G. J.: Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and Bone Marrow Cells, 85
Qualifications and Attitudes of Students entering Training Colleges: Recruits to Teaching—a Study of the Attainments, (F. W. Land), 750
Qualitative Distribution (Quantitative and), of Zooplankton in the Southern Part of the Norwegian Sea: Investigations on the (V. K. Hansen), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A. J. Southward, 360
Quantitative Biology: Cold Spring Harbor Symposia on, Vol. 24, Genetics and Twentieth Century Darwinism, *review* by Dr. H. Kalmus, 726
Quantitative Genetics: Introduction to (Dr. D. S. Falconer), *review* by Prof. Kenneth Mather, 813
Quantitative Investigation of the Echinoderm Fauna of the Central North Sea (Dr. Erik Ursin), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr. A. J. Southward, 360
Quantitative and Qualitative Distribution of Zooplankton in the Southern Part of the Norwegian Sea: Investigations on the (V. K. Hansen), Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A. J. Southward, 360
Quantities (Microgram), of Silver: Non-destructive Analysis of, by Radioactivation (Dr. Minoru Okada), 57
Quantum Chemistry—Methods and Applications (R. Daudel, R. Lefebvre and C. Moser), *review* by Prof. H. C. Longuet-Higgins, 541
Quarrell, Prof. A. G.: The Newer Metals, *review*, 725
Quarries: Accidents in Mines and, 1076
Quarries (Mines and), H.M. Inspectors of: Annual Reports for 1959—Scottish Division; Northumberland and Cumberland Division; Durham Division; North Eastern Division; North Western Division; East Midland Division; West Midland and Southern Division; South Western Division, 1076
Quartz-Dolerites: Stress-Dependent Magnetization in some (Dr. D. W. Powell), 225
Queen Elizabeth College, London: Grant of £3,800 from the Leverhulme Trust Fund, to enable a sociological research programme to be started in the Department of Nutrition, 201
  Appointment of Dr. Paul Morpurgo as Leverhulme Research Fellow in the sociology of nutrition, 201
  Grant of £56,000 from the London Research Foundation, to further the research work of the Department of Nutrition, with special reference to its work on fertility control, 201
Queen Mary College, London: Title of professor of organic chemistry in the University of London conferred on Dr. W. J. Hickinbottom, 466
  Title of reader in mechanical engineering in the University of London conferred on Dr. C. R. Webb, 904
Queen's University, Belfast: Appointment of Dr. D. W. R. Mackenzie to a lectureship in microbiology, 117
  Appointment of Dr. N. T. Dunwoody as lecturer in engineering mathematics, 465
  Appointment of R. G. A. Stretch as lecturer in psychology, 465
  Grant of £15,005 to Prof. D. R. Bates for Space Research (upper atmospheric rocket research, including artificial air-glow, altitudes of night-glow layers, and a study of micrometeorites), 744
Quelea quelea (Weaver Finch): Effects of Whole-body Irradiation on the Breeding Plumage of the (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Questions of Science and Faith (Dr. Hawthorne), 28
Quinic and Shikimic Acids: Excretion of Catechol after Ingestion of (Dr. A. N. Booth, D. J. Robbins, M. S. Masri and F. DeEds), 691
Quinol Phosphates: Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the Oxidation of (Dr. V. M. Clark, D. W. Hutchinson and Sir Alexander Todd), 59
Quirk, Dr. J. P., and Theng, B. K. G.: Effect of Surface Density of Charge on the Physical Swelling of Lithium Montmorillonite, 967
Quirk, Dr. J. P. (Aylmore, L. A. G., and): Domain or Turbostratic Structure of Clays, 1046
Quisenberry, Walter B.: Culture, Society and Health (Socio-Cultural Factors in Cancer), 658

R'S (The Two), of Plant Breeding, *review* by Dr. G. Haskell, 184
Rabess, S. L., and others: Fertility of Mice treated with Phosphorus-32, 876
Rabbit (Pregnant). Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a, for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Rabbit Anti-Mouse Erythrocyte Serum: Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Rabbit Flea, *Spilopsyllus cuniculi* (Dale): Breeding of the—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Rabbit Right and Left Heart Ventricles: Platelet-Count Differences in Blood of the (Dr. J. George Sharnoff and Dr. Vito Scardino), 334
Rabi, Prof. I. I.: Awarded the Barnard Medal for 1960 of Columbia University, New York, 24; work of, 24
Rabin, Dr. B. R., and others: Activity of Bovine Pancreatic Ribonuclease A in Mixed Solvent Systems, 601
Rabson, Dr. Alan S., and others: Production of Tumours in *Rattus* (*Mastomys*) *natalensis* by Polyoma Virus, 423
Race Differences in the Ability to excrete Beetroot Pigment (Betanin), (Dr. P. H. Saldanha, L. E. Magalhaes and Wanda A. Horta), 806
Racemization (Catalytic), of *tris*(Ethylenediamine)Cobalt (III) Ion (Dr. F. P. Dwyer and Dr. A. M. Sargeson), 1022
Radar Determination of the Scattering Properties of the Moon (Dr. Fred B. Daniels), 399
Radar Reflector: Roughness of the Moon as a (Dr. B. H. Briggs), 466, 490
Radiation: Ageing and (Dr. G. J. Neary), 10
Radiation (Atomic): The Biological Effects of—Summary Reports from a Study by the National Academy of Sciences (United States National Academy of Sciences—National Research Council), 380
Radiation (Cosmic): Local Increase of Intensity of (J.-P. Legrand and A. Helary), 397
Radiation (Cosmic), Latin American Council of: Meeting in Rio de Janeiro, 648
Radiation (Cosmic) Studies in South America, 648
Radiation (Hydrogen 21-cm.): Gravitational Red Shift of, as a Method to measure Galactic Gravitational Potential (L. F. Landovitz and L. Marshall), 223
Radiation (Intense): Biological Effects of Exposure to, 910
Radiation (Optical), in Ruby: Stimulated (Dr. T. H. Maiman), 493
Radiation and the Broad Bean, *review*, 8
Radiation Biology of *Vicia faba* in relation to the General Problem (Dr. John Read), *review*, 8
Radiation Chimaeras: Identification of Transplanted Bone Marrow Cells in (P. Czerski, O. Rosiek and J. Sablinski), 955
Radiation Chimaeras (Homologous): Polyvalent Immunological Tolerance in (Alena Lengerová), 160
Radiation Flux from a Heated Tube: Effect of Specular Reflexions on the (Sir K. S. Krishnan), 135
γ-Radiation Sources: Use of, for the Sterilization of Pharmaceutical Products (Report of the Association of the British Pharmaceutical Industry), 903
Radiation-induced Nitration of Aliphatic Hydrocarbons (Dr. Tyson Rigg), 933
Radiations (Ionizing): Chemical Effects of, on Nucleic Acids and Nucleoproteins (P. Emmerson, Dr. G. Scholes, D. H. Thomson, J. F. Ward and Prof. J. Weiss), 319
  Role of Oxygen in the Cross-linking and Degradation of Deoxyribonucleic Acid by (Peter Alexander and J. T. Lett), 933
Radic, a New British Analogue Computer (The Redifon Company), 288
Radical (CF_3): Photochemical Formation and Stability of the (Dr. J. P. Simons and A. J. Yarwood), 316
Radio Astronomy Observatory (National), Green Bank, West Virginia: Financial support from the United States National Science Foundation for the construction of, 910
Radio Emission from Jupiter: Ionospheric Modification of the (Prof. Alex G. Smith, T. D. Carr, H. Bollhagen, N. Chatterton and F. Six), 568
Radio Engineers, British Institution of: Report on the Education and Training of Professional Radio and Electronics Engineers, 115
Radio Engineers, Institute of (Benelux Section), in co-operation with others: International Symposium on Data Transmission, 290
Radio Engineers, Institute of (Group on Communications Systems), and others: International Symposium on Data Transmission, 290
Radio Frequency Control in Space Telecommunications (Edward Wenk, Jun.), 373
Radio Navigation (Avionics Panel of AGARD Symposium on), 1079
Radio and Electronics Engineers: Education and Training of Professional (British Institution of Radio Engineers Report on), 115
Radioactivation: Non-destructive Analysis of Microgram Quantities of Silver by (Dr. Minoru Okada), 57
Radioactive Areas in Rats exposed to a High Flux of Thermal-Neutrons: Localization by Autoradiography at −195° C. of—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Radioactive Fall-out in Ghana (Dr. A. H. Ward and J. D. Marr), 299
Radioactive Griseofulvin: Behaviour of, in Skin (Dr. A. Scott), 705
Radioactive Labelling of Lepidopterous Larvae—a Method of Estimating Late Larval and Pupal Mortality in the Wild (L. M. Cook and Dr. H. B. D. Kettlewell), 301
Radioactive Labelling of Membrane Filters for the Assay of Air-borne Material (Dr. G. Kubie and Dr. K. Spurny), 930
Radioactive and Natural Strontium in Human Bone (J. W. Arden, F. J. Bryant, E. H. Henderson, G. D. Lloyd and A. G. Morton), 994
Radioactivity of Soils, Plants and Bones (Sir Ernest Marsden), 192
Radioactivity at Water and Sewage Works: Problems of (Manchester College of Science and Technology Course of Lectures on), 743
Radiobiology and Radiology: Genetics,—Proceedings, Mid-Western Conference (edited by Dr. Wendell G. Scott and Dr. Titus Evans), *review* by Dr. Lorna J. Lilly, 97
Radiocaesium in Milk: Radiostrontium and, during 1959 (W. Anderson, L. K. Burton and J. O. Crookall), 108
Radioisotopes: Industrial Uses of (United Kingdom Atomic Energy Authority Course for Trade Union Officials), 905

Radiological Health and Safety : Training in (Prof. J. E. Roberts), 471
Radiology : Genetics, Radiobiology and—Proceedings, Mid-Western Conference (edited by Dr. Wendell G. Scott and Dr. Titus Evans), *review* by Dr. Lorna J. Lilly, 97
Radiolyses of Aqueous Solutions : Effects of *p*H and the Nature of the Primary Species in the (J. T. Allan and Dr. G. Scholes), 218
Radiolyses of Highly Enriched Oxygen-18 Water Solutions containing Hydrogen Peroxide-16,16 (Dr. Michael Anbar, Shmuel Guttmann and Prof. Gabriel Stein), 57
Radiolysis of Terpene Hydrocarbons—Isomerization and Polymerization of α- and β-Pinene (T. H. Bates and Dr. T. Ffrancon Williams), 665
Radiolysis of Water and Heavy Water : Effects of Linear Energy Transfer on the (Dr. E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Radiolytic Oxidation, of Ferrous Solutions with Standardized Internal Sources of Phosphorus-32 (Dr. M. Pesach and J. Steyn), 58
Radiophosphorus Assimilation in Organic and Inorganic Forms in Salmon : Bacterial Effect and (Dr. P. N. Srivastava), 83
Radiosensitivity of Mouse Kidney undergoing Compensatory Hypertrophy (Lieut. V. J. Rosen, jun., and Dr. L. J. Cole), 612
Radiosensitivity of Tumours : Chromosome Ploidy and (László Revész and Ulla Norman), 861
Radiostrontium and Radiocaesium in Milk during 1959 (W. Anderson, L. K. Burton and J. O. Crookall), 108
Radius (Equivalent Pore), of Kidney Slices from *Necturus* : Effect of Anti-Diuretic Hormone and Calcium on the (G. Whittembury, N. Sugino and Dr. A. K. Solomon), 699
Radley, J. M., and others : Alpha Activity of certain Botanical Materials, 208
Raising (Silkworm), on Artificial Food (Toshifumi Fukuda, Mitsumasa Suto and Yoshikichi Higuchi), 669
Rajhathy, Dr. T. (Morrison, Dr. J. W., and) : Frequency of Quadrivalents in Autotetraploid Plants, 528
Ramachandra Rao, Prof. B., and Padmini, P. R. K. L. : A Relation between Ultrasonic Velocity and Latent Heat of Vaporization, 311
Ramachandran, E. G., and Dasarathy, C. : Stabilization of Austenite by Hydrogen, 684
Ramamurti, K. (Jackson, Dr. C. P., and) : Syntheses of Glucose, Cellobiose and other Saccharides by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium, 942
Ramsay Memorial Fellowship Trust : Awards in Chemistry for 1960-61, 832
Rana temporaria (Common Frog) : Cyclical Changes in the Distribution of the Testis Lipids in the (Dr. B. Lofts and C. Boswell), 708
Randles, W. J. : Induced Fluorescence with Acridine Orange, after Osmium Fixation, 964
Random Theory : Nonlinear Problems in (Prof. Norbert Wiener), *review* by K. Krickeberg, 727
Ranganathan, G., and others : Potassium Tolerance Tests in South Indian People, 328
Range (Sieve) : A Method for the Routine Measurement of Particle Shape Factors in the (Dr. Colin C. Harris), 401 ; (D. Howitt), 403
Ranger, A. E., and Hopkins, L. F. : Behaviour of Paper during Tensile Straining, 1097
Rankama, Kalervo, and others (edited by) : Physics and Chemistry of the Earth, Vol. 3, *review* by B. E. Leake, 544
Rankin, K. N. : The Development of Pulp and Particle Board Industries and their Effect on Forest Management, 33
Rao, B. A. S., and Pruthi, J. S. : An Acid-tolerant and Non-sporulating Yeast from Passion Fruit Juice, 342
Rao, C. N. R. : Is Hyperconjugation Necessary ?, 913
Rapid Method for Studying Tumour Blood Supply using Lissamine Green (L. N. Owen), 795
Rapid Rates of Crystallization : A New Technique for following (J. H. Magill), 770
Rare Earth Groups : Products of the (Johnson, Matthey and Co., Ltd.), 832
Rare Modes in the Spontaneous Fission of Californium-252 (Prof. E. W. Titterton and T. A. Brinkley), 228
Rare and Dispersed Chemical Elements in Soils : The Geochemistry of (A. P. Vinogradov), second edition (translated from the Russian), *review* by A. H. Debnam, 629
Rat : Comparison of Iodine-124 and Iodine-131 in Inhibition of Goitrogenesis in the (Dr. I. Doniach and Dr. P. E. Francois), 704
  Effect of Reserpine on the Nucleotide and Catecholamine Content of the Denervated Adrenal Medulla of the (Prof. Nils-Åke Hillarp), 1032
  Hunger Reduction produced by Injecting Glucose into the Lateral Ventricle of the (L. J. Herberg), 245
  Metabolism of ^{14}C-Meso-inositol in the (Dr. D. A. Nixon), 77
  Strain Differences in Acetylcholine Concentration in the Brain of the (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Rat adapted to a Fat Diet : An Inverse Relation between the Liver Glycogen and the Blood Glucose in the (Dr. P. A. Mayes), 325
Rat Embryos : Effect of Trypan Blue on (F. Beck, Dr. B. Spencer and Prof. J. S. Baxter), 605
Rat Glomerulus and Nephritogenic Streptococci : Immunological Relationships between the (A. S. Markowitz, S. Howard Armstrong, jun., and Daniel S. Kushner), 1095
Rat Liver Microsome : Distribution of Protein-bound Aminoazo Dyes in the (Dr. T. Yamada, M. Matsumoto, S. Kanda and Prof. H. Terayama), 943
Rat Liver Mitochondria : A High-Energy Phosphate Requirement for Succinate Oxidation in Uncoupled (Dr. Giovanni Felice Azzone and Dr. Lars Ernster), 65
Rat Serum Acid Phosphatase : Total and $l(+)$ Tartaric Acid Inhibited (Dr. Z. Laron and B. Epstein Halberstadt), 67
Rat and some other Mammals : Potentiation of Contractility in the Heart Muscle of the (Dr. V. Kruta and Dr. P. Braveny), 327
Rat's Ventricle : Effect of Nitrate Ion on the Distribution of Sucrose in the (S. T. Taketa, C. G. Alexander and Prof. G. A. Feigen), 419
Ratcliffe, J. A. : The Magneto-Ionic Theory and its Applications to the Ionosphere, *review* by Sir Harrie Massey, 810
  Recent Trends in the Theory of the Ionosphere (Presidential Address to the Physical Society, 853
Rate of Mitosis in Lens Epithelium : Comparison between the Effects of Cysteine and of Anoxia on the (Dr. Antoinette Pirie and Dr. Ruth van Heyningen), 947
Rates (Metabolic), at the Cellular Level : Analysis of (Dr. L. G. Lajtha, R. Oliver, R. J. Berry and Elizabeth Hell), 919
Rates (Rapid), of Crystallization : A New Technique for following (J. H. Magill), 770
Ratio (Chlorine—Sodium), in the Atmosphere : Change of the, with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Ratio (Sex), of Ammocoetes (M. W. Hardisty), *erratum*, 29
Ratios (Lead Isotope) : Precision Intercomparisons of—Broken Hill and Mount Isa (F. Kollar, Prof. R. D. Russell and T. J. Ulrych), 754
Rats : Dextran and Insulin in (Dr. L. H. Marshall and C. H. Hanna), 1118
  Polyenoic Acid in Hypercholesterolaemia induced by Pyridoxine Deficiency in (Ajit Goswami and Prof. D. P. Sadhu), 786
  Production of Muscular Weakness in, by a Creatine Analogue (Coy D. Fitch and Prof. James S. Dinning), 421
Rats exposed to a High Flux of Thermal Neutrons : Localization by Autoradiography at −195° C. of Radioactive Areas in—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Rats during Irradiation : Role of Initial Value of Metabolic Processes in Oxygen Consumption Changes in (Dr. A. Vacek), 76
Rats in Sewers : Control of (Dr. W. E. Bentley), 288
Rats (Irradiated) : Synthesis of Diphosphopyridine Nucleotide in (Dr. D. K. Myers), 1124
Rats (Metacorticoid Hypertensive) : Electro-shock Seizure Threshold of (Dr. F. M. Sturtevant), 874
Rats (Young) : Influence of Different Types of Malnutrition on the ^{14}C-Lysine Metabolism in (Prof. Kurt Schreier and Corinna Kassens), 1117
Rattus (*Mastomys*) *natalensis* : Production of Tumours in, by Polyoma Virus (Dr. Alan S. Rabson, William J. Branigan and Frances Y. Legallais), 423
Rauen, Prof. H. M., and others : Action of Nucleic Acids on the Inhibition of Growth of Actinomycin of *Neurospora crassa*, 60
Raw, F. : Earthworm Population Studies—a Comparison of Sampling Methods, 257
Rawlins, F. I. G. : Introduction to Symbolic Logic and its Applications, *review*, 729
  The Hollow Universe, *review*, 890
γ-Ray Measurements : Fall-out Caesium in Surface Sea Water off the California Coast (1959-60) by (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Parrin Winchell), 480
γ-Ray Spectrometry : Non-destructive Analyses of Selenium by Neutron Activation followed by (Dr. Minoru Okada), 594
γ-Ray Spectroscopy : Gallium Arsenide for (W. R. Harding, C. Hilsum, M. E. Moncaster, D. C. Northrop and Dr. O. Simpson), 405
Rayner, M. J., and others : Speed of the Superconducting-Normal Transition in Tin Films, 492
Rayon Research Association (British) : Open Days (L. A. Wiseman), 121
Rays (Cosmic): Dependence on Latitude of the Amplitude of the Diurnal Variation of (Arne Eld Sandstrom, Eric Dyring and Stig Lindgren), 1099
Réacteurs Nucléaires : Évacuation et Récupération de la Chaleur des (Richard Alami et Paul Ageron), *review* by R. J. Syme, 636
Reaction with D-Benzylpenicilloic Acid with Cystine : Formation of D-Penicillamine-Cysteine Mixed Disulphide by (Dr. Bernard B. Levine), 940
Reaction (Transhydrogenase) : Histochemical Localization of Human, Term Placental 17β-Oestradiol Dehydrogenases— Implications for the (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Reaction Rate : Control of, in Dust Flames (J. M. Beér and Dr. R. H. Essenhigh), 1106
Reaction Time (Choice) : Time Uncertainty and (Paul Bertelson and Jean-Paul Boons), 531
Reactions (*in vitro* and *in vivo*), of Rabbit Anti-Mouse Erythrocyte Serum : Electrophoretic Separation of certain (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Reactions (Chemical) : Initiation of, by Mechanical Forces (Dr. Robert Schnurmann and Ivor S. Stringer), 587
Reactions (Egg-Yolk), of *Pseudomonas* Species (Dr. A. T. Willis and G. Gowland), 432
Reactions (Fast Transfer) : Physiological Role of (Massachusetts Institute of Technology Seminar Lectures on), 904
Reactions (Non-Enzymic), of Indoles with Coenzyme I (Prof. S. G. A. Alivisatos, G. A. Mourkides and A. Jibril), 374
Reactivation (Dye-sensitized Photo-), of X-Ray Damage in Diploid Yeast (Dr. David Freifelder and Prof. Robert B. Uretz), 953
Reactive Serine of a Proteolytic Enzyme from *Bacillus subtilis* : Amino-Acid Sequence about the (Dr. F. Sanger and D. C. Shaw), 872
Reactivity of the Disulphide Bond in Wool (Dr. L. J. Wolfram and Prof. J. B. Speakman), 595
Reactivity (Chemical), with Mercaptalbumin : An Ortho Effect influencing Fungitoxicity, Electronic Absorption Spectra, and (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Reactivity (Differential), of Saliva from 'Tasters' and 'Non-Tasters' of 6-*n*-Propylthiouracil (Frances Griffin and Prof. Roland Fischer), 417
Reactor Accident at Windscale in October 1957 : The Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Reactor (Atomic), (*Moata*) : Australia's Second, 741
Reactor (Nuclear) Chemistry (Oak Ridge National Laboratory Conference on), 994
Reactor (Nuclear) Technology : Analytical Chemistry in (Oak Ridge National Laboratory Conference on), 994
Reactor (Research) : *Hector*, a New (United Kingdom Atomic Energy Authority), 992
Read, Dr. John : Radiation Biology of *Vicia faba* in relation to the General Problem, *review*, 8
Rebman, Carole A., and others : A Bleached Variant of *Euglena gracilis* showing a Doubling of the Content of Deoxyribonucleic Acid, 1037
Recapture in the River Tweed of a Sea-Trout marked in Devonshire (A. Swain, I. R. H. Allan and M. J. Bulleid), 877

Recherche Scientifique, Centre National de la : International Colloquium on the Physics of Electrostatic Forces and their Applications, 466
  Colloques Internationaux No. 79, Premier Colloque International de Photographie Corpusculaire (Strasbourg, 1957), *review* by D. L. Allen, 636
Recherches Enzymologiques, Centre Inter-Universitaire de : Colloquium on Intracellular Localization of Enzymes, 836
Reciprocal Theorem and Theory of Statically Indeterminate Frameworks : A Historical Note on the (T. M. Charlton), 231
Recognition of Nulliparous Mosquitoes without Dissection (Dr. Philip S. Corbet), 525
Recombination of Oxygen Atoms in the Gas Phase (P. G. Dickens, R. D. Gould, Prof. J. W. Linnett and A. Richmond), 686
Recombination (Genetic), in *Salmonella typhimurium* occurring during Transmission of Colicinogeny (Dr. Ozeki and Dr. Howarth), 649
Reconstruction and Development, International Bank for : Articles of Agreement of the proposed International Development Association, as approved for submission to Governments by the Executive Directors of the, 266
Records : World Weather, 1941-50 (United States Weather Bureau), *review* by H. H. Lamb, 727
Records (Weather), of the World, *review* by H. H. Lamb, 727
Recovery of Capsules from *Discoverer* Satellites, 741
Recovery of Leukaemogenic Agent from Non-Leukaemic Tissues of Thymectomized Mice (J. F. A. P. Miller), 703
Recovery in the Presence of Chloramphenicol of *Escherichia coli* B (H) Irradiated with Ultra-violet Light (Kenshi Suzuki and Yukiko Iwama), 347
Recovery (Delayed), of Airborne *Serratia marcescens* after Short-Time Exposure to Ultra-violet Irradiation (Dr. R. L. Dimmick), 251
Recruits to Teaching—a Study of the Attainments, Qualifications and Attitudes of Students entering Training Colleges (F. W. Land), 750
Récupération de la Chaleur des Réacteurs Nucléaires : Évacuation et (Richard Alami et Paul Ageron), *review* by R. J. Syme, 636
Red Blood Cell Membrane : Chemical Constitution of the (Dr. T. Fehér and Dr. Béla Matkovics), 701
Red Cells (Human) : Adenosine Triphosphate and Maintenance of Shape of the (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Red Cross Society (Japanese) : Eighth International Congress of Blood Transfusion, 201
Red Executive : The (David Granick), 537
Red Shift of Hydrogen 21-cm. Radiation : Gravitational, as a Method to measure Galactic Gravitational Potential (L. F. Landovitz and L. Marshall), 223
Reddi, Dr. K. K. : Mode of Action of Micrococcal Phosphodiesterase, 74
Reddish, V. C. : New American Observatories, 910
Redifon Company : A New British Analogue Computer (*Radic*), 288
Redox Processes (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 650
Reduced Jaspilite (Roast) : Formation of Fayalite in (J. B. Lean, K. J. Tucker, B. O. Holland and T. R. Thomson), 683
Reductase (Photosynthetic), from a Green Plant : Crystallization of a (Dr. R. Hill and Fay Bendall), 417
Reduction of the Intestinal Absorption of Glucose, Methionine and Sodium Butyrate by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
Reduction in Tumour Formation : Polyoma Virus Mutant with a (Dr. Leo Sachs and Dan Medina), 715
Reduction (Hunger), produced by Injecting Glucose into the Lateral Ventricle of the Rat (L. J. Herberg), 245
Reduction Method (Ferricyanide), for Reducing Sugars (Dr. Richard L. Mateles), 241
Reducing Sugars : Ferricyanide Reduction Method for (Dr. Richard L. Mateles), 241
Rees, Sir J. Frederick (Chairman of the Editorial Committee) : The Cardiff Region—a Survey (prepared for the meeting of the British Association in Cardiff), *review*, 851
Rees, Dr. K. R. (Gallagher, Dr. C. H., and) : Levels of Pyridine Nucleotides in Liver Poisoning, 148
Rees, L. V. C. (Barrer, Prof. R. M., and) : Energies of Activation for Self-diffusion of Alkali Metal Ions in Analcite, 768
Rees, Dr. R. J. W. (Gledhill, Dr. A. W., and) : Effect of a Primary Tuberculous Infection on the Resistance of Male and Female Mice to Ectromelia, 703
Reference Book of Theoretical Physics, *review* by Prof. R. Eisenschitz, 445
Reference Material : Guide to (edited by Dr. A. J. Walford, with the assistance of L. M. Payne), *review* by R. Brightman, 273
Reflectance Measurements : Use of, in assessing the Colour Changes of Ageing Bloodstains (Dr. D. Patterson), 688
Reflectivity (Spectral), of Ore Minerals (L. Gray and Dr. A. P. Millman), 282
Reflector (Radar) : Roughness of the Moon as a (Dr. B. H. Briggs), 466, 490
Reflex (Peristaltic) : Effect of Wheat Gluten on the (Dr. R. Schneider, H. Bishop, Dr. B. Shaw and Prof. A. C. Frazer), 516
Reflexes (Hind-Limb), in the Kitten—Velocity and Conduction and Spinal Transmission of Proprioceptive Hind-Limb Reflexes (Dr. Sten Skoglund), 132 ; Properties of the Two-Neuron Arc (Dr. Sten Skoglund), 134
Reflexes (Proprioceptive Hind-Limb) : Velocity of Conduction and Spinal Transmission of (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 132
Reflexion of Signals from Satellite *Echo* I, 901
Reflexions (Specular) : Effect of, on the Radiation Flux from a Heated Tube (Sir K. S. Krishnan), 135
Regional Geology : Handbook of—Scotland, the Northern Highlands (Dr. J. Phemister), third edition, 831
Registration and Education, Illinois Department of : Biological Notes No. 41, Population Trends among Hawks and Owls in Illinois (Richard R. Graber and Jack S. Golden), 999
Regulation (Osmotic), in the Larvae of some Euryhaline Diptera (D. W. Sutcliffe), 331
Regulation (Self-) in Living Systems : Ottawa Symposia on, 3, Tremor, 297
Reichenow, Prof. Eduard : *Obituary* by Prof. P. C. C. Garnham, 554
Reid, E. T., and others : Attachment of Immature Simuliidae to other Arthropoda, 618
Reid, J. H., and others : The Solar Flare of June 1, 1960, 926
Reith Lectures, 1959 : The B.B.C. (Prof. P. B. Medawar), *review* by Dr. J. D. Nisbet, 446
Relation between Ultra-sonic Velocity and Latent Heat of Vaporization (Prof. B. Ramachandra Rao and P. R. K. L. Padmini), 311
Relation (An Inverse), between the Liver Glycogen and the Blood Glucose in the Rat adapted to a Fat Diet (Dr. P. A. Mayes), 325
Relations (Plant- and Soil- Water) : Terminology in (Dr. R. O. Slatyer and Prof. S. A. Taylor), 922
Relationship between Nucleus and Cytoplasm—Proceedings of the Symposium held at the Université Libre de Bruxelles, 1958 (edited by Dr. R. J. C. Harris), *review* by Dr. E. N. Willmer, 450
Relationships (Immunological), between the Rat Glomerulus and Nephritogenic Streptococci (A. S. Markowitz, S. Howard Armstrong, Jun., and Daniel S. Kushner), 1095
Relationships (Major Element), in Tektites (R. D. Cherry, Dr. S. R. Taylor and Maureen Sachs), 680
Relative Availability of some Strontium-90 Compounds in Soil (Dr. R. L. Uhler and Dr. F. P. Hungate), 252
Relative Lengths of Leaf Sheath and Blade with reference to the Developmental Stages of the Rice Plant (Dr. B. Saha), 259
Relativity, *review* by Dr. D. W. Sciama, 4
Relativity : Theory of (W. Pauli), translated from the German by G. Field, *review* by Dr. D. W. Sciama, 4
Relativity of 'Meaning' (Dr. W. Ross Ashby), 532
Relaxin : Analyses of (Edward H. Frieden), 200
Relic-Soil on Limestone in South Wales (D. F. Bell), 497
Religion (West African) : Oedipus and Job in (Prof. Meyer Fortes), *review* by Michael Argyle, 96
Religion and Social Structure, *review* by Michael Argyle, 96
Remfry, Jennifer : Appointed Junior Universities Federation for Animal Welfare (UFAW) Research Fellow, to assist Dr. Phyllis G. Croft at the Royal Veterinary College in research relating to anaesthetics and relaxants, 743
Removal of Internally Deposited Americium by Chelating Agents (Dr. F. D. Sowby and Dr. D. M. Taylor), 612
Renal Function in Extracorporeal Circulation : Influence of 5-Hydroxytryptamine on (Dr. M. H. Frick), 609
Renal Studies in Sheep : Use of Diodone in (B. J. Potter), 698
Rendle, B. J. : The Development of Pulp and Particle Board Industries and their Effect on Forest Management (Anatomical Criteria for Industrial Use), 33
Rensch, Prof. Bernhard : Evolution above the Species Level, *review* by C. S. Elton, 446
Reports (Scientific and Technical) : Indexes for (ASLIB Survey on), 372
Reproduction : Endocrinology of, *review* by Prof. P. L. Krohn, 5
  Marshall Chair of the Physiology of, Cambridge, 113
  Recent Progress in the Endocrinology of—Proceedings of the Conference held in Syracuse, 1958, *review* by Prof. P. L. Krohn, 5
Reproduction Out of Season : Conditioning *Ostrea edulis* L. from Limfjord for (L. A. Abou-Ela), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 25), *review* by Dr. A. J. Southward, 360
Republic (Czechoslovak) : Climatic Atlas of the, *review* by G. A. Bull, 543
Requirement of a 'Factor' From a Pregnant Rabbit for Ovarian Maturation : Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)— (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Research : Animal Experiments in, *review* by Dr. W. Lane-Petter, 977
  Dental, 556
  Mellon Institute (1959-1960)—the Annual Report to the Board of Trustees of the Institute for the Fiscal Year 1959-1960 (Matthew R. Ridgway), 908
  Road, 464
  Space, *review* by Sir Harold Spencer Jones, 268
Research in Biochemistry and Allied Sciences : Organization and Financing of (Biochemical Society and the British Association for the Advancement of Science Colloquium on), 650
Research in Case Studies, 659
Research in any branch of Chemistry : Grants for assistance in (Chemical Society), 466
Research in Dairying, National Institute for : Report for 1959, 909
Research in Tinplate in Australia, 904
Research in the Use of Electronic Computers (Unesco Fellowships for), 465
Research Necessary for the Preparation and Use of Case Studies (South London Committee of the British Institute of Management Conference on), 660
Research (Agricultural and Scientific), Overseas, 556
Research (Atmospheric), United States National Centre of : Appointment of Dr. Walter Orr Roberts as director, 200
Research (Atomic Energy), in Denmark, 33
Research (Atomic Energy and Space) : Resources for, 1055
Research (Basic), in the Navy (United States Department of Defense, Department of the Navy, Naval Research Advisory Committee), (Report prepared by Arthur D. Little, Inc.), 178
Research (Defence), and Development : British, 177
Research (Educational) : The Need for, 883
Research (Geological), in the Northern Highlands of Scotland, 831
Research (Lipid), at the Rowett Institute, 1951-59 (Dr. G. A. Garton), 115
Research (Medical), National Institute for : Appointment of Prof. P. B. Medawar as director, 374, 991
Research (Medical), in the Paris Hospitals, 26
Research (Nuclear), in the U.S.S.R., *review* by Dr. S. C. Curran, 630
Research (Oceanographic) : Intergovernmental Conference on, 647
Research (Oceanographic and Fisheries), by the Submarine *Severyanka* (V. P. Zaitzev), 559
Research (Polar), in the U.S.S.R., 287
Research (Potato), European Association for : Series of Triennial Conferences, 466
Research (Recent American), in Neuropsychiatry, *review* by Dr. D. H. Brinton, 447
Research (Scientific), in East Africa, 206
Research (Scientific), in the United States : Control of, *review* by R. Brightman, 181
Research (Scientific) : Satellites and (Desmond King-Hele), *review* by Sir Harold Spencer Jones, 268

Research (Scientific), into Road Safety (European Productivity Agency of the Organization for European Economic Co-operation Discussion on), 116
Research (Scientific), and Development—a Comparative Study (S. Dedijer), 458
Research (Scientific and Industrial) : Co-operation and, 89
Research (Space), in Britain · Grants to Universities, 744
Research Center : A New Gas Chromatography (Barber-Colman Company, Houston), 289
Research Committee on Archaeological Field Experiments, 289
Research Council of Alberta : Fortieth Annual Report (1959), 660
Research Defence Society · *Conquest* Pamphlet No. 11, Vaccination against Whooping Cough, Diphtheria and Tetanus, 649
Research Equipment Exhibit · Tenth Annual Instrument Symposium and (United States National Institutes of Health), 559
Research Fellowship (Armourers and Brasiers'), awarded to Dr. J. H. Brunton, 291
Research Fellowship (Foulerton Gift), awarded by the Royal Society to Dr. J Seed, 291
Research Institute for the Study of Man (Division of Anthropology of the New York Academy of Sciences and the) · Conference on Culture, Society and Health, 658
Research Laboratories (Graduate) : Grants for (United States National Science Foundation), 559
Research Progress in General Medical Sciences, 1959 : Highlights of (United States Department of Health, Education and Welfare, Publication No. 739), 200
Research Reactor : *Hector*, a New (United Kingdom Atomic Energy Authority), 992
Research Studentship (Mackinnon), awarded by the Royal Society to Dr. D. T. Edmonds, 291
Research Studentships for postgraduate training in Ecology (Nature Conservancy Awards for 1960), 742
Research Study Group on the Use of Toxic Chemicals in Agriculture and Food Storage : Request for evidence, 290
Research and Development in Fuel and Power : Advisory Council for, 286
Research and Development in Industry (Dr. E. J Solvay), 830
Research and Development (Aeronautical), Advisory Group for—see under AGARD
Research and Development (Materials), for National Security : More Effective Organization and Administration of (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Reserpine : Effect of, on the Nucleotide and Catecholamine Content of the Denervated Adrenal Medulla of the Rat (Prof. Nils-Åke Hillarp), 1032
  Influence on the Effect of Vasoconstrictor Amines by Pretreatment with (H. C. Sabelli), 784
  A Suggested Effect on Levels of Catecholamine in Brain produced by Small Doses of (F. Barbara Orlans and Dr. Bernard B Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Residues (Nonanal), in Potatoes : Determination of (W. F. van Vliet and W. H. Schriemer), 235
Resistance to 8-Azaguanine in *Diplococcus pneumoniae* : Transformation of (Francis M. Sirotnak, Ramona B. Lunt and Dorris J Hutchison), 800
Resistance of Male and Female Mice to Ectromelia · Effect of a Primary Tuberculous Infection on the (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Resistance (High-Temperature), and Thermal Degradation of Polymers (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 466
Resistant *L*1210 Mouse Leukaemia Cells : Effect of 6-Mercaptopurine on the Net *in vitro* Gas Production of Sensitive and (Dr. H. J. Woodliff), 156
Resisting Couple : Effect of a, on the Rotational Motion of a Rigid Body (T. Nonweiler), 311
Resistivity (Electrical), of Thermosetting Polymers : Dependence on Temperature of the (R. W. Warfield and M. C. Petree), 316
Resonance : Nuclear Magnetic, *review* by Dr. L. M. Jackman, 358
  High-resolution Nuclear Magnetic (J. A. Pople, W. G. Schneider and H. J. Bernstein), *review* by Dr. L. M. Jackman, 358
Resonance (Paramagnetic), in Solids (William Low), (Solid State Physics—Advances in Research and Applications, Supplement 2), *review* by Dr. R. O. Davies, 886
Resonance (Spin) Techniques : Diamagnetic Moment of Gaseous Plasmas measured by (T. C. Marshall, R. A. Kawcyn and Prof. L. Goldstein), 584
Resonance Spectroscopy (Proton Magnetic) : Structure Determination with the Help of (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely, Dr. R. F. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Resources : Managerial—an International Survey, 535
Resources for Atomic Energy and Space Research, 1055
Resources (Natural), American Institute of Geonomy and : John Fleming Medal awarded to Dr. Maurice Ewing, 905
Resources (Water), in the United States (Prof. W. G. V. Balchin), 562
Respiration (Carbon Monoxide-sensitive) : Absence of, in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin (Hanna Engelberg and Dr. M. Artman), 801
Respiratory-chain Enzymes : Effect of Heavy Water on (Dr. H. Laser and Prof. E. C. Slater), 1115
Response (Hormone-like), in *Hydra* : Enzymatic Activation of a, by Proteases (Dr. Howard M. Lenhoff and John Bovaird), 671
Response (Photoperiodic), of *Xanthium* : Effect of Glutathione and Alloxan on the (J. Nitsan), 81
Responses (Antibody), of the Domestic Fowl to Two Soluble Bacterial Antigens (Dr. G. Gowland), 624
Responsiveness (Immunological) : 6-Mercaptopurine in (Dr. John L. Robinson and Dr. Charles L. Christian), 796
Restoration of Membrane Excitability of Calcium-deficient Muscles by Anodal Polarization (Prof K. Koketsu and K. Noda), 243
Results (Geological), of Petroleum Exploration in Britain by the British Petroleum Company during the Years 1945-57 (N. L. Falcon and P. E. Kent), 1078
Retained Austenite and the Tempering of Martensite (S. Matas and Prof. R. F. Hehemann), 685
Reticulo-Endothelial System : Depressing Activity of Meprobamate on the (Prof. A. Del Vecchio and L. Bolis), 513
  Effect of some Aromatic Hydroxy Compounds on the Phagocytic Activity of the (Prof T. Nicol, C. Druce and C. C. Ware), 422
  Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the (Prof. T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
Retinal Degeneration induced by Iodate and Iodoacetate : Protective Effect of Cysteine against (Prof. Arnold Sorsby and Ronald Harding), 608
Retractor Muscle (Anterior Byssus), of *Mytilus edulis* : The Membrane Potential of the (Dr D H Paul), 1121
Reversibility of an Inherited Metabolic Block (Inborn Error of Metabolism), (Dr. Herman Zondek, Dr Hannah E Leszynsky and Dr. Joseph A. Stein), 515
Reversible Dissociation of Ribonucleic Acid (R. A. Brown, K. A. O. Ellem and Dr. J. S Colter), 509
Révész, László, and Norman, Ulla · Chromosome Ploidy and Radiosensitivity of Tumours, 861
Revised Geological Time-Scale (Prof. Arthur Holmes), 27
Revised Name for *Musa ensetaeformis* Berry : *Ensete berryi*— (R. K. Jain), 342
Rey, Prof. L · Freezing and Drying of Biological Materials, 749
Rh Factor C in South African Bantu (Dr. A. Zoutendyk and Dr. H. Teodorczuk), 790
Rhenium · Work-Hardening and Ductility of, and their relation to the Behaviours of other Metals having a Hexagonal Structure (R. A. Jaffery and E. Smith), 52
Rheology of Polymers (British Society of Rheology Discussion on), 290
Rheology, British Society of . Discussion on Rheology of Polymers, 290
Rhizosphere Microflora of *Camellia sinensis* : Foliar Application of Nutrients and (Dr. C. S. Venkata Ram), 621
Rhoderick, E. H., and others : Speed of the Superconducting-Normal Transition in Tin Films, 492
Rhodes, Joan M. : The Ouchterlony Technique using Antigen or Antiserum labelled with Iodine-131, 793
Rhodesia (Southern) : Environment and Culture in (Roger Summers), 993
Rhythm of Output of Carbon Dioxide of Excised *Bryophyllum* Leaves : Effects of Light and Darkness on the (Dr. Malcolm B. Wilkins), 523
Ribonuclease : Effect of, on Erythrocyte Antigens (Prof. Emanuel Hackel and Robert E. Smolker), 1036
Ribonuclease A (Bovine Pancreatic) : Activity of, in Mixed Solvent Systems (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Ribonucleic Acid · Reversible Dissociation of (R. A. Brown, K. A. O. Ellem and Dr. J. S. Colter), 509
Ribonucleic Acid (Infective), from the Viruses of Talfan and Teschen Diseases (F Brown and Doreen L. Stewart), 714
Ribosomes from Embryonic Plant Tissue : Stabilization by Manganous Ions of (Dr. J. W Lyttleton), 1026
Rice : Secondary Selection in Pure Lines of (T. K. Yen), 169
  Viability and Germination Inhibitor of the Seed of (Prof. S. M. Sircar and Manjula Biswas), 620
Rice Plant : Relative Lengths of Leaf Sheath and Blade with reference to the Developmental Stages of the (Dr. B. Saha), 259
Richards, Dr. Audrey I. : Elected president for 1960-61 of the Royal Anthropological Institute, 114
Richards, Dr. M., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Richards, Paul I. : Manual of Mathematical Physics, *review* by Prof. I. Estermann, 445
Richards, Sarah W., and others · Oceanography of Long Island Sound, 123
Richards, Dr. T. G. : Appointed to a senior lectureship in physiology in the University of Liverpool, 117
Richardson, D. A., and others : Gamma Irradiation of Lead Silicate Glass, 135
Richardson, Prof. F. D. : The Extraction of Metals and the Chemistry of Metals (Fourth Robert Horne Memorial Lecture of the Society of Chemical Industry), 466
Richardson, I. D , and others : Echo Sounding Experiments in the Barents Sea, 855
Richardson (L. F.) Prize of the Royal Meteorological Society, 28
Richmond, A., and others : Recombination of Oxygen Atoms in the Gas Phase, 686
Richmond, J. Wendy (Daniels, Dr. N. W. R., and) : Gas Liquid Chromatography of Conjugated Fatty Acids, 55
Richter, Dr. D. : Influence of Editors, 120
Ricinus communis Seeds : Anti-Pneumococcus Type XIV Activity of Precipitins from (Lieut.-Col. G. W. G. Bird), 415
Ridgway, Matthew R. : Mellon Institute Research 1959-1960—the Annual Report to the Board of Trustees of the Institute for the Fiscal Year 1959-1960, 908
Ricketts, Dr. C. R., and others : Phosphate Esters produced by Mammalian Skin from 2-Deoxy-D-Glucose, 1028
Rifkind, Richard A., and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094
Rigaux, Fernand : Les Observatoires Astronomiques et les Astronomes, *review* by Dr. R. v. d. R. Woolley, 1063
Rigby, B. J., and Spikes, Dr. J. D. : Hydroxyproline and the Shrinkage Temperature of Collagen, 150
Riggs, Dr. Tyson : Radiation-induced Nitration of Aliphatic Hydrocarbons, 933
Rigid Body : Effect of a Resisting Couple on the Rotational Motion of a (T. Nonweiler), 311
Rigler, Prof. R., and others : A Polyploidizing Principle in the Spleen, 965
Riley, Gordon A., and others : Oceanography of Long Island Sound, 123
Riley, Dr. J. F. (Coupland, Dr. R. E., and) : Mast Cells and 5-Hydroxytryptamine in Precancerous Mouse Skin, 1128
Riley, Dr. J. P. (Greenhalgh, R., and) : Alleged Occurrence of the Perchlorate Ion in Sea-Water, 1107
Rimington, Prof. C., and Miley, Dr. R. A. : The Fourth International Goitre Conference, 651
Rimmer, R., and others : Gamma Irradiation of Lead Silicate Glass, 135
Rinfret, Dr. A. P. : Freezing and Drying of Biological Materials, 749
Ringwood, Dr. A. E. : Olivine—Spinel Transition on Nickel Orthosilicate, 1019
Ritchie, J. N. : Tuberculosis in Animals, 996

River (Sierra Leone) : Plankton of the Estuary and Offshore Waters of the (V. Bainbridge), 557
River Tweed : Recapture in the, of a Sea-Trout marked in Devonshire (A. Swain, I. R. H. Allan and M. J. Bulleid), 877
Rivers Memorial Medal of the Royal Anthropological Institute awarded to Prof. J. C. Mitchell, 114
Road Accidents during Christmas 1959 (Road Research Laboratory, Technical Paper No. 49), 1000
Road Research, 464
Road Research Laboratory : Road Research Technical Paper No. 49, Report on Road Accidents during Christmas 1959, 1000
Road Safety : Scientific Research into (European Productivity Agency of the Organization for European Economic Co-operation Discussion on), 116
Roantree, Prof. R. J., and Collis, L. R. : Effect of the Peritoneal Fluid of the Guinea Pig on Strains of Enteric Bacilli, 1045
Roast Reduced Jaspilite : Formation of Fayalite in (J. B. Lean, K. J. Tucker, B. O. Holland and T. R. Thomson), 683
Robb, Prof. J. C. : Physico-chemical, Biological and Applied Aspects of Autoxidation (New Method in work on Autoxidation of Hydrocarbons in the Liquid Phase), 746
Robb, Prof. J. C., and others : Cage Effect in the Liquid-Phase Photolysis of Fluorinated Ketones, 314
Robbins, Dr. A. B. : Appointed a lecturer in physics at the University of Birmingham, 117
Robbins, D. J., and others : Excretion of Catechol after Ingestion of Quinic and Shikimic Acids, 691
Roberts, Prof. J. E. : Training in Radiological Health and Safety, 471
Roberts, Dr. L. E. J. : Crystal Chemistry of Simple Compounds of Uranium, Thorium, Plutonium, Neptunium, *review*, 728
Roberts, Dr. Walter Orr : Appointed director of a United States National Centre of Atmospheric Research, 200
Robertson, Prof. Alexander : Appointed a member of the Agricultural Research Council, 290
Robertson, Dr. J. G. : Ovarioles as a Meristic Character in Coleoptera, 526
Robertson, R. H. S. : The Output of Scientists in Scotland, 1600-1950, 372
Robertson, Prof. R. N. : Appointed to the chair of botany in the University of Adelaide, 740 ; work of, 740
Robinson, Dr. C. : Colloid and Polymer Science (Liquid Crystals of Synthetic Polypeptide), 378
Robinson, E. L. (edited by T. E. Dancy and) : Flat Rolled Products—Rolling and Treatment, *review* by Prof. F. C. Thompson, 273
Robinson, H. W. : Obituary by Prof. E. N. da C. Andrade, 23
Robinson, Dr. John L., and Christian, Dr. Charles L. : 6-Mercaptopurine in Immunological Responsiveness, 796
Robinson, Sir Robert : The Chemistry of Natural Products, 1080
  Degree of D.Sc., *honoris causa*, of the University of Sydney conferred on, 1081
Robinson, Roy : Occurrence of a Brown Mutation in the Syrian Hamster, 170
Robson, Prof. W. : Retirement from the chair of biochemistry at King's College, London, 286 ; work of, 286
Rochereil : La Grotte de (P. E. Jude), 903
Rock-Shelter Art in Malaya : Newly Discovered (J. M. Matthews), 373
Rock Shelter Paintings near Bauchi, Northern Nigeria (Hamo Sassoon), 200
Rockefeller Institute : Promotion of Dr. Edward H. Ahrens, Jun., and Dr. James G. Hirsch to professors and members, 290
  Appointment of Dr. G. Jones to the Sophie Fricke Royal Society Research Fellowship, 1079
Rocket (Skylark) Sodium Experiment : Upper-Atmosphere Wind Studies by (Dr. G. V. Groves), 1001
Rocks from the South Atlantic : Potassium—Argon Ages of some (John A. Miller), 1019
Rocks (Terrestrial) : Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Roddy, William T., and others (edited by) : The Chemistry and Technology of Leather, Vol. 2, Types of Tannages, *review* by Prof. A. G. Ward, 724
Rodionov, V. N., and Tsikulin, M. A. : The Tunguska Meteorite, 1077
Rodley, G. A. : Awarded a New Zealand fellowship by the Ramsay Memorial Fellowship Trustees, 832
Rods (Glass) : Strengths of Acid-etched (B. A. Proctor), 492
Roentgen Prize of the Justus Liebig University of Giessen awarded to J. B. Adams, 201
Roessler, F. (Behrens, H., and) : Combustion and Propulsion—High Mach Number Air-breathing Engines (Experiments with Supersonic Diffusion Flames), 20
Role of Initial Value of Metabolic Processes in Oxygen Consumption Changes in Rats during Irradiation (Dr. A. Vacek), 76
Role of Mucoid Substances of the Aorta in the Deposition of Lipids (Dr. S. Gero, Dr. J. Gergely, Dr. T. Dévényi, Dr. L. Jakab, Dr. J. Székely and Dr. S. Virág), 152
Role of Oxygen in the Cross-linking and Degradation of Deoxyribonucleic Acid by Ionizing Radiations (Peter Alexander and J. T. Lett), 933
Role in Protein Synthesis : Cytoplasmic Particles and their (Colloid and Biophysics Committee of the Faraday Society Informal Discussion on), 643
Role (Physiological), of Fast Transfer Reactions (Massachusetts Institute of Technology Seminar Lectures on), 904
Rolinson, Dr. G. N., and others : Formation of 6-Aminopenicillanic Acid from Penicillin by Enzymatic Hydrolysis, 236
Rolled Products : Flat—Rolling and Treatment (edited by T. E. Dancy and E. L. Robinson), *review* by Prof. F. C. Thompson, 273
Romanoff, Prof. L. Alexis : The Avian Embryo, *review* by Prof. C. H. Waddington, 814
Roos, G., and others : A Transplantable Spontaneous Osteogenic Sarcoma observed in the Muscle Tissue of an Albino Mouse, 1129
Rongine de Fekete, Dr. Maria A., and others : Mechanism of Starch Biosynthesis, 918
Roodyn, D. B. : Cytoplasmic Particles and their Role in Protein Synthesis (Requirements for the Incorporation of Amino-Acids into Proteins of Mitochondria and of Microsomes), 645
Room Temperature : Biosynthesis of Sucrose by Preparations from Potatoes stored in the Cold and at (Dr. Sigmund Schwimmer and Edward S. Rorem), 1113
Rorem, Edward S. (Schwimmer, Dr. Sigmund, and) : Biosynthesis of Sucrose by Preparations from Potatoes stored in the Cold and at Room Temperature, 1113
Rosbaud, Dr. P. : Obituary of Prof. Max von Laue, 738, *erratum*, 905
Rose, Harry M., and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094
Rosen, Jun., Lieut. V. J., and Cole, Dr. L. J. : Radiosensitivity of Mouse Kidney undergoing Compensatory Hypertrophy, 612
Rosenberg, Dr. H., and Ennor, Prof. A. H. : Occurrence of Free D-Serine in the Earthworm, 617
Rosenfeld, Prof. L. : Newton's Correspondence, *review*, 537
Rosenfield, C. (O'Brien, Prof. R. N., and) : Possible Discovery of Ion-Pairs by Interferometry, 935
Rosenkranz, W., and others : A Polyploidizing Principle in the Spleen, 965
Rosenzweig, Mark R., and others : Strain Differences in Acetylcholine Concentration in the Brain of the Rat, 787
Rosiek, O., and others : Identification of Transplanted Bone Marrow Cells in Radiation Chimaeras, 955
Ross, Angela J. (Atkin, N. B., and) : Polyploidy in Human Tumours, 579
Ross, Prof. Alan S. C. : Theory of Optimal Games, 968
Ross, Dr. J. M. : Tuberculosis in Animals, 996
Ross (Ian Clunies) Animal Research Laboratory, Prospect, New South Wales (Dr. Ian W. McDonald), 980
Rosser, Prof. J. Barkley : Appointed chairman of the Mathematics Division of the United States National Academy of Sciences—National Research Council, 647
Rotating Array (A Highly Directive), for 16 Mc./s. (Prof. J. A. Thomas and Dr. R. W. E. McNicol), 398
Rotation of Satellite 1958δ1 : Effect of Upper Atmosphere Wind on the (Dr. C. R. Faulkner), 926
Rotational Absorption (Pure), of Ozone in the Region 125-500 Microns (Dr. H. A. Gebbie, N. W. B. Stone and C. D. Walshaw), 765
Rotational Motion of a Rigid Body : Effect of a Resisting Couple on the (T. Nonweiler), 311
Rotatory Powers (Optical), of Alkaloids, *review* by Dr. J. Walker, 7
Rotblat, Prof. J., and others : Effects of Whole-body Irradiation on the Breeding Plumage of the Weaver Finch, *Quelea quelea*, 615
Rotenone : Mechanism of the Physiological Action of (Prof. P. E. Lindahl and K. E. Öberg), 784
Rothamsted Experimental Station : Report for 1959, 661
Rothschild, Rt. Hon. Lord : X and Y Spermatozoa, 253
Roubinek, L., and others : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy, 662
Roughness of the Moon as a Radar Reflector (Dr. B. H. Briggs), 466, 490
Routine Measurement of Particle Shape Factors in the Sieve Range : A Method for the (Dr. Colin C. Harris), 401 ; (D. Hewitt), 403
Rowe, Dr. G. W. : Appointed lecturer in industrial metallurgy at the University of Birmingham, 465
Rowe, J. J. : Awarded a Nature Conservancy Diploma Course in Conservation and Ecology at University College, London, 742
Rowe, Dr. T. W. G. : Freezing and Drying of Biological Materials, 749
Rowell, D. A. (Scott, C. G., and) : Gas-Solid Chromatographic Separation of Hydrocarbons of High Molecular Weight, 143
Rowett Research Institute : Collected Papers of the, 115
Royal Anthropological Institute : Huxley Memorial Medal for 1961 awarded to Dr. A. E. Mourant, 114
  Rivers Memorial Medal awarded to Prof. J. C. Mitchell, 114
  Wellcome Medal for 1959 awarded jointly to E. M. Chilver and Dr. P. Kaberry, 114
  Election of Officers for 1960-61, 114
Royal Botanic Gardens, Kew (F. Ballard), 119
Royal Cancer Hospital, London : Appointment of E. J. Ambrose to the University of London readership in physical chemistry at the Institute of Cancer Research, 904
  Title of reader in chemistry in the University of London conferred on G. M. Timmis, 904
Royal College of Physicians, and others : First British Congress on the History of Medicine and Pharmacy, 374
Royal College of Science and Technology, Glasgow : Annual Report (1958-59), 115
Royal College of Surgeons of England : New Laboratory Building, 118
Royal College of Surgeons of England, and others : First British Congress on the History of Medicine and Pharmacy, 374
Royal Commission for the Exhibition of 1851 : Studentship and Scholarship Awards for 1960, 116
Royal Free Hospital School of Medicine, London : Appointment of Dr. C. B. B. Downman to the Sophia Jex-Blake chair of physiology, 466
Royal Geographical Society : Research Series No. 3, The Making of the Broads (Dr. J. M. Lambert, J. N. Jennings, C. T. Smith, Charles Green and J. N. Hutchinson), *review* by Miles Burkitt, 636
Royal Grammar School (Lancaster) Natural History Society : *The New Biologian*, No. 9, 649
Royal Greenwich Observatories : Integration of the Cape and, 464
Royal Institute of Chemistry (Manchester and District Section), and the Society of Chemical Industry (Manchester Section and Fine Chemicals Group) : Symposium on Drugs for the Treatment of Hypertension, 743
Royal Institute of Engineers, and others : International Congress on the Technology of Plastics Processing, 559
Royal Meteorological Society : L. F. Richardson Prize, 28
  Summer Meeting (Weather Problems in Agriculture), 995
Royal Naval College, Greenwich : Nuclear Training Facilities at the (Prof. J. Edwards), 545
Royal Navy Hydrographic Department : Retirement of Rear Admiral K. St. B. Collins as hydrographer to the Navy, 286
  Appointment of Rear Admiral E. G. Irving as hydrographer to the Navy, 286
Royal Netherlands Chemical Federation, and others : International Congress on the Technology of Plastics Processing, 559
Royal Society of Edinburgh : Year Book for 1959-60, 25

Royal Society of London : Appointment of Dr. Dorothy C. Hodgkin as the first Holder of the Wolfson Research Professorship, 24
  Year Book (1960), *review*, 97
  New Foreign Members, 112
  Three hundredth Anniversary, 265
  Presidential Address at the Formal Opening of the Tercentenary Celebrations (Sir Cyril Hinshelwood), 274
  First Award of the Medal of the Iron and Steel Institute made to the, 286
  Appointment of Dr. J Seed to a Foulerton Gift Research Fellowship, at the Department of Radiotherapeutics, University of Cambridge, 291
  Appointment of Dr. D. T. Edmonds to a Mackinnon Research Studentship, at the Clarendon Laboratory, Oxford, 291
  Exhibition at the Science Museum, London, to illustrate the first Forty Years of the Royal Society, 374
  The Beginning of the (Margery Purver and Dr. E. J. Bowen), *review* by Dr. William P. D. Wightman, 356
  A Brief History of the (Prof. E. N. da C. Andrade), *review* by Dr. William P. D. Wightman, 356
  Appointment of Prof. A. Schluter to the first visiting professorship, 463
  Tercentenary Lecture, Evolution of Nuclear Power Plant Design (Sir Christopher Hinton), 1064
  Appointment of Dr. G. Jones to the Sophie Fricke Research Fellowship in the Rockefeller Institute, 1079
Royal Society, its Origins and Founders (edited by Sir Harold Hartley), *review* by Dr William P. D Wightman, 356
Royal Society and the Progress of Science Abroad (Prof. R. J. Forbes), 100
Royal Society and the Armourers and Brasiers' Company : Appointment of Dr. J. H. Brunton to the Armourers and Brasiers' Research Fellowship at the Laboratory for the Physics and Chemistry of Solids, Cavendish Laboratory, Cambridge, 291
Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme : Awards, 291
Royal Society of Medicine, and others : First British Congress on the History of Medicine and Pharmacy, 374
Royal Swedish Academy of Engineering Sciences and the Swedish Association of Technical Physicists : Fifth International Instruments and Measurements Conference and Exhibition, 374
Royal Veterinary College, London : Appointment of Jennifer Remfry as Junior Universities Federation for Animal Welfare (UFAW) Research Fellow, to assist Dr Phyllis G Croft in research relating to anaesthetics and relaxants, 743
  Appointment of Dr. F. A. Holton to the University of London readership in veterinary biochemistry, 904
Rubber : Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the Cross-linking of (L. Mullins and D T. Turner), 145
Rubber Industry, Institution of the : Colwyn Medal awarded to Dr. Erich Konrad, 464
  Hancock Medal for 1960 awarded to C. B. Copeman, 464
Rubber Technology, *review* by Dr. W. F. Watson, 359
  Introduction to (edited by Maurice Morton), *review* by Dr. W F. Watson, 359
Rubio-Huertos, Miguel, and Desjardins, Paul R : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of Ultra-thin Sections, 1043
Ruby : Stimulated Optical Radiation in (Dr T H. Maiman), 493
Rudebeck, Gustav, and others (edited by) : South African Animal Life—Results of the Lund University Expedition in 1950-1951, Vol. 6, *review* by H. Oldroyd, 1063
Rudge, A J. B (Mead-Briggs, A. R , and) : Breeding of the Rabbit Flea, *Spilopsyllus cuniculi* (Dale)—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation, 1136
Rudnick, Prof Dorothea (edited by) : Cell, Organism and Milieu—Seventeenth Symposium of the Society for the Study of Development and Growth, *review* by Dr. E. N. Willmer, 450
Rumen Oligotrich Protozoa : Effect of Penicillin on the Maintenance o (G. S Coleman), 518
Runcorn, Prof S K. : I.G.Y.—Year of Discovery, *review*, 185
Runcorn, Prof. S. K., and others (edited by) : Physics and Chemistry of the Earth, Vol. 3, *review* by B E Leake, 544
Rural England, Council for the Preservation of Twenty-first National Conference for the Preservation of the Countryside, 559
Rural Land Use Pattern in Cyprus : The Evolution of the (Dr Demetrious Christodoulou), *review* by Prof. M. J Wise, 628
Rural Life (English), Museum of . Report for 1959, 26
Rural Population (Swedish) : A Clinical and Genetico-Statistical Study of Schizophrenia and Low-Grade Mental Deficiency in a Large (Bertil Hallgren and Torsten Sjogren), 298
Rusanov, F. N. Botanical Garden in Tashkent, 902
Russell, Prof Dorothy S. Title of professor emeritus of morbid anatomy in the University of London conferred on, 466
Russell, Sir John : Future of British Agriculture, *review*, 721
Russell, P. M., and others : Pattern of Haemopoiesis in the Foetal Liver, 876
Russell, Prof. R. D., and others Precision Intercomparisons of Lead Isotope Ratios—Broken Hill and Mount Isa, 754
Russia · Engineering Education in (S. P. Timoshenko), 537
Russian Biological Publications · Translations of (American Institute of Biological Sciences), 558
Russian Earth Satellite 1960λ, 830
Rycroft, Prof H B : Given an Award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 291
Ryder, Dr. M L. Follicle Remains in some British Parchments, 130
Rydon, Prof H. N., and others · Structures of some Acetyl-serine Peptides from Acetyl-chymotrypsin, 596
Ryle, G. B The Development of Pulp and Particle Board Industries and their Effect on Forest Management, 33
Ryle, Prof. M. . Grant of £2,678 for Space Research (for the recording and the interpretation of Doppler and Faraday effects in the radiations from artificial satellites), 744

SABELLI, H C. · Influence on the Effect of Vasoconstrictor Amines by Pretreatment with Reserpine, 784
Sablifiski, J., and others : Identification of Transplanted Bone Marrow Cells in Radiation Chimaeras, 955
Saccharides : Syntheses of Glucose, Cellobiose and other, by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium (Dr. C P. Jackson and K. Ramamurti), 942
Sachs, Dr. Leo, and Medina, Dan : Polyoma Virus Mutant with a Reduction in Tumour Formation, 715
Sachs, Maureen, and others : Major Element Relationships in Tektites, 680
Sacks, T. G., and others : Host-Range of *Lactobacillus* Bacteriophages, 348
Sadhu, Prof D. P. (Goswami, Ajit, and) · Polyenoic Acid in Hypercholesterolaemia induced by Pyridoxine Deficiency in Rats, 786
Saev, Dr. G K , and others : Adaptive Chain in the Conversion of Anti-metabolites into Metabolites, 1041
Safety in Mines Research Establishment Bibliography, 1960 (compiled by E. B. Smith), second edition, *review* by Prof. S. G. Ward, 1063
Safety (Nuclear), Advisory Committee on : Appointment of an, 113
Safety (Radiological Health and) : Training in (Prof. J E. Roberts), 471
Safety (Road) : Scientific Research into (European Productivity Agency of the Organization for European Economic Co-operation Discussion on), 116
Saffman, Dr. P. G. : Appointed reader in mathematics at King's College, London, 117
Saha, Dr. B. : Relative Lengths of Leaf Sheath and Blade with reference to the Developmental Stages of the Rice Plant, 259
Sakai, Dr Akira : Survival of Woody Plants at Extremely Low Temperatures, 1134
Sakharov, D A. : Centenary Celebrations of W M. Bayliss and J S Haldane in Moscow, 912
Saldanha, Dr P. H., and others . Race Differences in the Ability to excrete Beetroot Pigment (Betanin), 806
Salicylate : Anti-Inflammatory Activity of (Dr. V. Marks and Dr. M. J. H. Smith), 610
Saliva from 'Tasters' and 'Non-Tasters' of 6-n-Propylthiouracil : Differential Reactivity of (Frances Griffin and Prof. Roland Fischer), 417
Salmon · Bacterial Effect and Radiophosphorus Assimilation in Organic and Inorganic Forms in (Dr. P. N. Srivastava), 83
Salmonella typhimurium · Genetic Recombination in, occurring during Transmission of Colicinogeny (Dr. Ozaki and Dr. Howarth), 649
Salomon, Prof. K. (Altman, K. I., and) : Localization of a Halogenated Porphyrin in Mouse Tumours, 1124
Salt (Triassic)—Discoveries in the Cheshire-Shropshire Basin (Sir William Pugh), 278
Salters' Company Election of Officers for 1960-61, 29
Salts (Molten) 'Enthalpy Titrations' and Thermochemistry in (Prof. Joseph Jordan, Jurg Meier, Edward J. Billingham, jun., and James Pendergrast), 318
Saltpeter, Prof. E. E. : Elected to an Overseas Fellowship of Churchill College, Cambridge, 742
Sampling Methods : Earthworm Population Studies—a Comparison of (F. Raw), 257
Sandell, Prof. E B. : Colorimetric Determination of Traces of Metals, third edition, *review* by A. M. G Macdonald, 3
Sanders, J., and others : Isotopic Analysis of Silicon by Solid-Source Mass Spectrometry using Negative Ions, 683
Sandstrom, Arne Eld, and others : Dependence on Latitude of the Amplitude of the Diurnal Variation of Cosmic Rays, 1099
Sanger, Dr. F., and Shaw, D. C. : Amino-Acid Sequence about the Reactive Serine of a Proteolytic Enzyme from *Bacillus subtilis*, 872
Sanitation in Aviation : Guide to Hygiene and (World Health Organization of the United Nations), 911
Sanity and Madness : The Divided Self—a Study of (Dr R D Laing), *review* by Dr Clifford Allen, 1062
Sanjana, N H., and others . New Compounds for the Control of Water Evaporation, 870
Sankar, Dr. D. V. Siva, and others Effect of Lysergic Acid Diethylamide on Larval Growth, 153
Sap-Transmissible Viruses associated with Diseases of Grape Vines in Europe and North America (C. H Cadman, H. F. Dias and B. D. Harrison), 577
Saprophytic Fungi (Obligately Parasitic and) · Incorporation of Acetate into Protein by (Dr. Richard C Staples and Dr. H. P. Burchfield), 1040
Saratovkin, D. D. : Dendritic Crystallization (translated from the Russian by Dr. J. E. S. Bradley), second edition, *review* by A. F. Wells, 93
Sarcoma : A Transplantable Spontaneous Osteogenic, observed in the Muscle Tissue of an Albino Mouse (R G Herne, M. Gregoire and G. Rona), 1129
Sargeson, Dr. A M. (Dwyer, Dr F. P., and) · Catalytic Racemization of *tris* (Ethylenediamine) Cobalt (III) Ion, 1022
Sarin, P. S · Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Sarker, A. Q. : Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Sassoon, Hamo : Rock Shelter Paintings near Bauchi, Northern Nigeria, 200
Satellite : Science as History—the Story of Man's Technological Progress from Steam Engine to (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J L. Stollery, 8
Satellite 1958δ1 · Effect of Upper Atmosphere Wind on the Rotation of (Dr. C R. Faulkner), 926
Satellite 1960λ : The Russian Earth, 830
Satellite *Echo* I (1960ι), 741
  Reflexion of Signals from, 901
Satellite Signals : Ionospheric Information from (Dr. G. H. Munro), 1017
Satellite *Sputnik* 3 : Final Months and Descent of (B. R. May and D. E. Smith), 456
Satellite *Sputnik* 4 : The Sudden Discontinuity in the Orbital Period of (B R. May and D. E. Smith), 866
Satellite *Tiros* I : Cloud Pictures from, 647
Satellites (*Discoverer*) · Recovery of Capsules from, 741
Satellites and Scientific Research (Desmond King-Hele), *review* by Sir Harold Spencer Jones, 268
Saunders, J. T., and Manton, Dr. S M. : A Manual of Practical Vertebrate Morphology, third edition, *review* by Dr. N. B. Marshall, 9
Sawhney, B. L. : Aluminium Interlayers in Clay Minerals, Montmorillonite and Vermiculite—Laboratory Synthesis, 261
Sawyer, Prof. Wilbur H : Evidence for the Identity of Natriferin, the Frog Water-Balance Principle and Arginine Vasotocin, 1030
Saxl, H. (Hall, Dr. D. A., and) : Human and other Animal Cellulose, 547

Sayers, Prof. J. : Grant of £26,000 for Space Research (electron and ion-population studies of the upper atmosphere and interplanetary space), 744
Sayers, Prof. R. S. : Monetary Thought and Monetary Policy in England (Presidential Address to Section F (Economics) of the British Association for the Advancement of Science), 844
Sayre, Dr. D., and Friedlander, Dr. P. H. : Crystal Structure of 9:10-Dimethyl-1:2-benzanthracene, 139
Scale (The Helium-4), of Temperature (F. C. Brickwedde, H. van Dijk, M. Durieux, J. R. Clement and J. K. Logan), 1077
Scale (Small-) Turbulent Diffusion in the Atmosphere (Dr. L. A. Clarenburg and C. E. Spaans-v. d. Tang), 586
Scale (Time-) : A Revised Geological (Prof. Arthur Holmes), 27
Scardino, Dr. Vito (Sharnoff, Dr. J. George, and) : Platelet-Count Differences in Blood of the Rabbit Right and Left Heart Ventricles, 334
Scarrott, G. G. : Application of Computer Techniques to Nuclear Physics Instruments (Duddell Medal Address to the Physical Society), 854
Scattering Phase-Shifts : Distorted Wave Approximation for (Dr. P. Swan), 585
Scattering Properties of the Moon : Radar Determination of the (Dr. Fred B. Daniels), 399
Sceptre Discharge : Periodic Magnetic Field Fluctuations in the (Dr. N. L. Allen), 279
Schiff, Leonard L. (edited by Emilio Segrè and, in association with Gerhart Friedlander and Walter E. Meyerhof) : Annual Review of Nuclear Science, Vol. 9, *review* by Dr. E. B. Paul, 182
Schilder, Peter, and others : Effect of Lysergic Acid Diethylamide on Larval Growth, 153
Schizophrenia and Low-Grade Mental Deficiency in a Large Swedish Rural Population : A Clinical and Genetico-Statistical Study of (Bertil Hallgren and Torsten Sjogren), 298
Schlüter, Prof. A. : Appointed to the first visiting professorship of the Royal Society, 463 ; work of, 463
Schmidt, Prof. B., and others : Non-specific Haemagglutinin from Cellulose and Cellulose Ion Exchanger, 790
Schmidt, K. : Changes in Conductivity of Pure Water caused by X-Irradiation, 931
Schmidt, Dr. Karl Rudolf : Nutzenergie aus Atomkernen, *review* by K. R. E. Smith, 979

Schultz, Dr. Stanley G., and Solomon, Dr. A. K.: A Bacterial Mutant with Impaired Potassium Transport, 802
Schuringa, G. J. (Prins-van der Meulen, P. Y. F., and) : Evidence for Multiple Nature of Cellulase of *Myrothecium verrucaria*, 695
Schurr, Henry M., and others : Oceanography of Long Island Sound, 123
Schwarz, Jan, and others : Absence of Local Cytotoxic Change in Man from Griseofulvin, 335
  Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin on Tumours induced in Mice by Methylcholanthrene, 335
Schwimmer, Dr. Sigmund, and Rorem, Edward S. : Biosynthesis of Sucrose by Preparations from Potatoes stored in the Cold and at Room Temperature, 1113
Sciama, Dr. D. W. : Relativity, *review*, 4
Science—Chemistry, Physics, Astronomy (editorial board : Dr. J. Bronowski, with Sir Gerald Barry, James Fisher and Sir Julian Huxley), *review* by Dr. D. R. Dickinson, 978
Science : British Men of—a New Series to be published by Nelson, 374
  Francis Bacon, the First Statesman of (J. G. Crowther), *review* by Prof. B. Farrington, 817
  Colloid and Polymer (Seminar at University College, London, on), 378
  Logic, Methodology and Philosophy of (International Union for History and Philosophy of Science International Congress for), 201
  A Mythical, *review* by Dr. K. O. L. Burridge, 7
  Soviet Space (Ari Shternfeld), translated by the United States Air Force, *review*, 884
  The Two Aspects of (Sir George Thomson), 837
Science Abroad : The Royal Society and the Progress of (Prof. R. J. Forbes), 100
Science and Christianity : Bridging the Gap between, *review* by R. Brightman, 818
Science and Education in Britain, 906
Science and Faith : Questions of (Dr. Hawthorne), 28
Science for the Family, *review* by Dr. D. R. Dickinson, 978
Science of High Explosives (Prof. Melvin A. Cook), *review* by Dr. W. L. Murray, 539
Science as History—the Story of Man's Technological Progress from Steam Engine to Satellite (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J. L. Stollery, 8
Science and Meat, *review* by Prof. J. Hawthorn, 888
Science of Meat and Meat Products (Members of the Research Staff of the American Meat Institute Foundation), *review* by Prof. J. Hawthorn, 888
Science and the Public, 371
Science and State Government—a Study of the Scientific Activities of State Government Agencies in Six States (Dr. Frederic N. Cleaveland), *review* by R. Brightman, 181
Science and Technology : Interactions of, with Society, 1
  National Lending Library for, 992
Science and Technology in Africa South of the Sahara, 198
Science and Technology, Manchester College of : Summer School in Modern Methods of Crystal Structure Determination, 201
  Course of lectures on Problems of Radioactivity at Water and Sewage Works, 743
Science and Technology, Royal College of (Glasgow) : Annual Report (1958-59), 115
Science and Technology (Food) : International Congress of, 905
Science, Australian Academy of : Selby Fellowship for 1960 awarded to Dr. W. Deuchars, 464
  Symposium on the Chemistry of Natural Products (sponsored by the International Union of Pure and Applied Chemistry), 1080
Science, British Society for the Philosophy of : Fifth Annual Conference, 559
Science, Czechoslovak Academy of : International Conference on Semiconductor Physics, 29
Science, International Union for History and Philosophy of : International Congress for Logic, Methodology and Philosophy of Science, 201
Science (Agricultural) : Proceedings of the University of Nottingham Sixth Easter School in (1959)—The Measurement of Grassland Productivity (edited by Prof. J. D. Ivins), *review* by Dr. G. W. Cooke, 544
Science (Applied), of Victoria (Museum of), Melbourne : Annual Report for 1958-59, 372
Science (Eighteenth-Century) : The Transits of Venus—a Study of (Prof. Harry Woolf), *review* by Dr. David S. Evans, 636
Science (Leather) : The Present Position of, *review* by Prof. A. G. Ward, 724
Science (Modern) : Causation and, *review* by Dr. J. O. Wisdom, 92
Science (Nuclear) : Annual Review of (edited by Emilio Segrè and Leonard L. Schiff, in association with Gerhart Friedlander and Walter E. Meyerhof), Vol. 9, *review* by Dr. E. B. Paul, 182
  Progress in, *review* by Dr. E. B. Paul, 182
Science (Social) : Medicine as a, *review* by Prof. E. Maurice Backett, 633
Science (Soviet), in English Catalogue, 1960 (Program for Science Translations, Jerusalem), 832
Science (Veterinary) : Advances in (edited by C. A. Brandly and E. L. Jungherr), Vol. 5, *review* by Prof. H. Burrow, 448
Science Broadcasting in Sound and Television (A. B. Oldfield Davies), 850
Science Fiction : Beyond, *review* by Dr. D. J. West, 270
Science *Horizons* : Title of *Atoms for Peace Digest* changed to (United States Information Service), 902
Science Masters' Association : Survey on Science Teaching in Secondary Modern Schools, 206
Science Museum, London : Operation of a Star-Projector, 117
  Presentation to the Library of a collection of Japanese scientific and technical books and dictionaries on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
  Exhibition to illustrate the first Forty Years of the Royal Society of London, 374
Science *News, French* : No. 1, January-March 1960, Special article on Medical Research in the Paris Hospitals, 26
Science Teaching in Secondary Modern Schools (Science Masters' Association Survey on), 206
Sciences, New York Academy of : Annals, Vol. 85, Article 2, Freezing and Drying of Biological Materials (Dr. Harold T. Meryman, and 12 other Authors), 748
Sciences, New York Academy of (Division of Anthropology), and the Research Institute for the Study of Man : Conference on Culture, Society and Health, 658
Sciences (Allied) : Organization and Financing of Research in Biochemistry and (Biochemical Society and the British Association for the Advancement of Science Colloquium on), 650
Sciences (Biological), American Institute of : Translations of Russian Biological Publications, 558
Sciences (Biological), International Union of (International Union of Biochemistry and the) : Symposium on Biological Structure and Function, 905
Sciences (Engineering), Royal Swedish Academy of, and the Swedish Association of Technical Physicists : Fifth International Instruments and Measurements Conference and Exhibition, 374
Sciences (General Medical) : Highlights of Research Progress in, 1959 (United States Department of Health, Education and Welfare, Publication No. 739), 200
Sciences (Nuclear), Boris Kidrich Institute of : Bulletin, Vol. 10, 831
Sciences (Nutritional), International Union of, of the United States National Academy of Sciences—National Research Council, and others : Fifth International Congress on Nutrition, 201
Sciences (Physical) : Probability and related Topics in (Prof. Mark Kac), *review* by Prof. M. S. Bartlett, 1060
Sciences (Physiological), International Union of (Section of Pharmacology) : First International Pharmacological Meeting, 29
Sciences (Social) : The Literature of the (Peter R. Lewis), *review*, 729
Scientific Activities at Halley Bay : Recent—International Geophysical Co-operation, 1959 (M. J. Blackwell), 982
Scientific Age : The Spiritual Crisis of the (G. D. Yarnold), *review* by R. Brightman, 818
Scientific Information, Institute for (Philadelphia) : *Index Chemicus*, No. 1, 993

Scientific Institutions and Scientists in Latin America (Unesco Centre for Scientific Co-operation in Latin America), Vol. 4, Argentina, 29
Scientific Instrument Manufacturers' Association : Election of Officers for 1960-61, 742
Scientific Mission in Washington (United Kingdom) : Appointment of Dr. H. T. Hookway as director, 24
Scientific Periodical Publications : Cost of (Capt. I. R. Maxwell), 1052
Scientific Personnel : Shortages of, in European Countries in Process of Development, 565
Scientific Publications Council : Discussion on the Influence of Editors, 120
Scientific Radio Union (International) : Thirteenth General Assembly, 902
Scientific Research : Satellites and (Desmond King-Hele), *review* by Sir Harold Spencer Jones, 268
Scientific Research in East Africa, 206
Scientific Research in the United States : Control of, *review* by R. Brightman, 181
Scientific Research into Road Safety (European Productivity Agency of the Organization for European Economic Co-operation Discussion on), 116
Scientific Research and Development—a Comparative Study (S. Dedijer), 458
Scientific Research (Agricultural and), Overseas, 556
Scientific Results of the Danish Deep-Sea Expedition round the World, 1950-52 : Galathea Report— (edited by Dr. Anton Bruun, Capt. Sv. Greve and Prof R. Spärck), *review* by Dr. N. B. Marshall, 443
Scientific Translations : Israel Programme for, 832
Scientific Unions, International Council of : Year Book for 1960, 198
Scientific Work of J S. Haldane (1860-1936), (Prof. J. B. S. Haldane), 102
Scientific and Engineering Personnel : Direction and Supervision of (Northampton College of Advanced Technology, London, Advanced Course on), 905
Scientific and Industrial Research : Co-operation and, 89
Scientific and Industrial Research, Council of (Indian) : Bibliography of Indian Scientific and Technical Publications, 199
Scientific and Industrial Research, Council of (Indian), (Chemical Research Committee) : Symposium on Redox Processes, 650
Scientific and Industrial Research, Department of : Report of the Research Council for 1959, 89
  Report of the Council for 1959, 118
  Conference on Ergonomics in Industry, 117
  The National Physical Laboratory—Open Days (H. G. Short), 454
  Grant of £5,000 to the Department of Physics in the University of Leeds, 465
  The National Engineering Laboratory, 1960—Open Days (R. I. Lithgow), 899
  Report of the National Chemical Laboratory for 1959, 902
  Symposium on Flow Measurement in Closed Conduits, at the National Engineering Laboratory, 905
  Open Days at the National Chemical Laboratory, 994
  Building Research Station Digest 133, Domestic Heating and Thermal Insulation, 999
  Road Research Laboratory, Technical Paper No. 49, Report on Road Accidents during Christmas 1959, 1000
  Report of the Warren Spring Laboratory (1959), 1082
  Building Research Station, Factory Building Studies No. 6, Noise in Factories (A. G. Aldersey-Williams), 1085
Scientific and Industrial Research Organization (Australian Commonwealth) : Establishment of a new Sugar Research Laboratory, 372
  Appointment of Dr. H. H. Hatt as leader of research in the Sugar Research Laboratory, 372
  List of Publications to December 31, 1959, 466
  Appointment of Dr. S. D. Hamann as chief of the Division of Physical Chemistry, 901
  Retirement of S. A. Clarke as chief of the Division of Forest Products, 901
  Grant of £6,000 from the Broken Hill Proprietary Company, to support tinplate research, 904
Scientific and Industrial Research, Department of (New Zealand) : Retirement of R. C. Hayes as superintendent of the Seismological Observatory, Wellington, 24
  Appointment of Dr. F. F. Evison as superintendent of the Seismological Observatory, Wellington, 830
Scientific and Technical Books : Recent, Supp. vi, July 30 ; Supp. iv, August 27 ; Supp. vi, September 24
Scientific and Technical Books and Dictionaries (Japanese) : A Collection of, presented to the Science Museum Library, London, on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
Scientific and Technical Publications (Indian) : Bibliography of (Council of Scientific and Industrial Research, New Delhi), 199
Scientific and Technical Reports : Indexes for (ASLIB Survey on), 372
Scientist and Technologist in Administration, 353
Scientists in Scotland, 1600-1950 : The Output of (R. H. S. Robertson), 372
Scientists (Scientific Institutions and), in Latin America (Unesco Centre for Scientific Co-operation in Latin America), Vol. 4, Argentina, 29
Scope for Expanding Pulp and Board Industries in Britain (J. J. MacGregor), 32
Scotland—the Northern Highlands (Dr. J. Phemister), (Handbook of Regional Geology), third edition, 831
Scotland : The Output of Scientists in, 1600-1950 (R. H. S. Robertson), 372
Scott, Dr. A. : Behaviour of Radioactive Griseofulvin in Skin, 705
Scott, C. G., and Rowell, D. A. : Gas-Solid Chromatographic Separation of Hydrocarbons of High Molecular Weight, 143
Scott, H. M., and others : Growth of Sulphide Films on Steel, 588
Scott, Dr. J. S. : Appointed to a senior lectureship in obstetrics and gynaecology in the University of Liverpool, 117
Scott, Dr. Patricia P (Greaves, Dr. J. P., and). Urinary Amino-Acid Pattern of Cats on Diets of varying Protein Content, 242
Scott, Dr. Wendell G., and Evans, Dr. Titus (edited by) : Genetics, Radiobiology and Radiology Proceedings, Mid-Western Conference, *review* by Dr. Lorna J. Lilly, 97
Scott, W. H., and others : Management in Britain—a General Characterization, 537
Scottish Field Studies Association : Annual Report for 1959, 200
Screw Sense of the α-Helix in Poly-β-benzyl-L-aspartate (E. M. Bradbury, A. R. Downie, Dr. A. Elliott and W. E. Hanby), 321
Scriven, L. E., and Sternling, C. V. : The Marangoni Effects, 186
Scrutton, Hugh : At the sixty-sixth Annual Conference of the Museums Association (Purchase of Art Objects for Museums), 657
Sea : The Earth beneath the (Prof. Francis P. Shepard), *review* by Dr. G. E. R. Deacon, 629
Sea (Barents) : Echo Sounding Experiments in the (L. D. Richardson, D. H. Cushing, F. R. Harden Jones, R. J. H. Beverton and R. W. Blacker), 855
Sea (Central North) : A Quantitative Investigation of the Echinoderm Fauna of the (Dr. Erik Ursin), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr. A. J. Southward, 360
Sea (Irish) : Pleistocene History of the (G. F. Mitchell), 842
Sea (Norwegian) : Investigations on the Quantitative and Qualitative Distribution of Zooplankton in the Southern Part of the (V. K. Hansen), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 23), *review* by Dr. A. J. Southward, 360
Sea-Trout marked in Devonshire : Recapture in the River Tweed of a (A. Swain, I. R. H. Allan and M. J. Bulleid), 877
Sea-Water : Alleged Occurrence of the Perchlorate Ion in (R. Greenhalgh and Dr. J. P. Riley), 1107
Sea Water (Surface), off the California Coast (1959-60) : Fall-out Caesium in, by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Seals : Age Determination of (H R. Hewer), 959
Search for Oil in Britain, 1078
Season : Conditioning *Ostrea edulis* L. from Limfjord for Reproduction out of (I. A. Aboul-Ela), (Meddelelser frå Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 25), *review* by Dr. A J. Southward, 360
Second Mechanism of Inhibition at the Crayfish Neuromuscular Junction (Dr. Josef Dudel and Prof. Stephen W. Kuffler), 247
Second Transition Group : Ferromagnetic and Antiferromagnetic Behaviour in the (Dr. B. R Coles and D. Griffiths), 226
Second Virial Coefficient of Methane at Low Temperature (G. Thomaes and R. Van Steenwinkel), 229
Secondary Modern Schools : Science Teaching in (Science Masters' Association Survey on), 206
Secondary Selection in Pure Lines of Rice (T. K. Van), 169
Secretion (Dorsal Skin), of *Xenopus laevis* : Serotonin, a Melanocyte-stimulating Component in the (Dr. F. C. G. van de Veerdonk), 948
Sections (Ultra-thin) : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of (Miguel Rubio-Huertos and Paul R Desjardins), 1043
Sections (Ultra-thin), of Vitrinite from a High-volatile Bituminous Coal : Absorption of Ultra-violet and Visible Light by (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Security (National) : More Effective Organization and Administration of Materials Research and Development for (United States National Academy of Sciences—National Research Council, Publication No. 718), 470
Sediment Cores from the Eastern Atlantic Ocean : Magnetization of (M J. Keen), 220
Sedimentation Characteristics of the β-Chain Haemoglobin (Haemoglobin 'Bart's'), (Dr. R. A. Kekwick and Dr. H. Lehmann), 158
Seed, Dr. J : Appointed by the Royal Society to a Foulerton Gift Research Fellowship at the Department of Radiotherapeutics, University of Cambridge, 291
Seed of Rice : Viability and Germination Inhibitor of the (Prof. S. M. Sircar and Manjula Biswas), 620
Seed Coats (Legume) : Inhibition of Nodule Bacteria by an Antibiotic from (J A. Thompson), 619
Seeded Varieties (Seedless and), of *Vitis vinifera* : Toxicity of Gibberellin to (Dr. Robert J. Weaver), 1135
Seedless and Seeded Varieties of *Vitis vinifera* : Toxicity of Gibberellin to (Dr Robert J Weaver), 1135
Seedling (Wheat) : Plant Hormone Activity—Stilboestrol applied to the (Dr. J. J. C. Hinton and Dr. T. Moran), 258
Seeds (*Ricinus communis*) : Anti-Pneumococcus Type XIV Activity of Precipitins from (Lieut.-Col. G. W. G Bird), 415
Seegal, Beatrice C., and others : Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy, 1094
Seel, D. C. : Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Zoology), 742
Segrè, Emilio, and Schiff, Leonard I. (edited by, in association with Gerhart Friedlander and Walter E. Meyerhof) : Annual Review of Nuclear Science, Vol. 9, *review* by Dr. E. B, Paul, 182
Seifert, Prof. Howard S. (edited by) : Space Technology, *review*, 884
Seiji, Dr. M., and others : Melanin Granules and Mitochondria, 392
Seismic Body Waves : Oscillatory Character of Amplitude Curves for (Dr. J. Vanek and J. Stelzner), 491
Seismological Observatory, Wellington, New Zealand : Retirement of R. C. Hayes as superintendent, 24
  Appointment of Dr. F. F. Evison as superintendent, 830
Seismology in New Zealand, 830
Seitz, Frederick, and Turnbull, David (edited by) : Solid State Physics—Advances in Research and Applications, Vols. 7, 8, 9 and 10, *review* by Dr. R. O Davies, 886
Seizure Threshold (Electro-shock), of Metacorticoid Hypertensive Rats (Dr. P. M. Sturtevant), 874
Selachii : Modification of the Neurocranium in *Zygaena malleus* and the Nature of the Optic Stalk in (Dr. A. R. Hamdy), 257
Selby Fellowship for 1960 awarded to Dr. W. Deachars, 464
Selection of Executives (T. H. Hawkins), 31
Selection (Secondary), in Pure Lines of Rice (T. K. Van), 169
Selective Cytochemical Demonstration of Arginine Groups in Nucleoprotein in the Cell Nucleus (Dr. E. A. Barnard and Dr. L. G. E. Bell), 508
Selective Solvents (Two Highly), for Gas-Liquid Chromatography Analysis of C_6-C_8 Hydrocarbons (Dr. A van der Wiel), 142
Selenium : Non-destructive Analysis of, by Neutron Activation followed by Gamma-Ray Spectrometry (Dr. Minoru Okada), 594
Self : The Divided—a Study of Sanity and Madness (Dr. R. D. Laing), *review* by Dr. Clifford Allen, 1062
Self-Diffusion of Alkali Metal Ions in Analcite : Energies of Activation for (Prof. R. M. Barrer and L. V. C. Rees), 768

Self-Fertilization in the Calyptraeidae : Protandry and (Dr. H. V. Wyatt), 520
Self-Incompatible Cocoa : Selfing of (D. R. Glendinning), 170
Self-Regulation in Living Systems : Ottawa Symposia on, 3, Tremor, 297
Selfing of Self-Incompatible Cocoa (D. R. Glendinning), 170
Selmeczi, F. V., and others : Damage to Liver induced by DL-Methionine-Ethylester, 421
Semiconducteurs : Les (Prof. P. Aigrain et F. Englert), *review* by Dr. J. R. Tillman, 1058
Semiconducteurs Électroniques : Les (Dr. E. Spenke), traduit par L. Godefroy, *review* by Dr. J. R. Tillman, 1058
Semiconductor Devices : The Properties, Physics and Design of (John N. Shive), *review* by Dr. J. R. Tillman, 1058
Semiconductor Physics (Czechoslovak Academy of Science International Conference on), 29
  A Source-Book of, *review* by Prof. G. F. J. Garlick, 885
Semiconductors (Dr. R. A. Smith), *review* by Prof. G. F. J. Garlick, 885
  Progress in (edited by Dr. Alan F. Gibson, Prof. R. E. Burgess and Dr. F. A. Kroger), Vol. 4, *review* by Dr. J. R. Tillman, 185
Semiconductors and Transistors, *review* by Dr. J. R. Tillman, 1058
Semi-Insulator : Gallium Arsenide as a (J. W. Allen), 403
Senegal : Haptoglobin Types in 398 Blood Donors from Dakar, (Dr. J. Moullec, Dr. J. M. Fine and J. Linhard), 517
Senftle, Dr. Frank E., and others : Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks, 1089
Sense (Screw), of the α-Helix in Poly-β-benzyl-L-aspartate (E. M. Bradbury, A. R. Downie, Dr. A. Elliott and W. E. Hanby), 321
Sensitive and Resistant L1210 Mouse Leukaemia Cells : Effect of 6-Mercaptopurine on the Net *in vitro* Gas Production of (Dr. H. J. Woodliff), 156
Sensitivity (Electrical), of the Ampullae of Lorenzini (Dr. R. W. Murray), 957
Sensitivity (Tuberculin) : Production of (Prof. Hubert Bloch and Albert A. Nordin), 434
Sensitivity (X-Ray), of *Serratia marcescens* : Effect of Glycerine on the (Dr. D. L. Dewey), 1008
Sensitization (Anaphylactic), of Isolated Tissues *in vitro*: Influence of the Ionic Strength of the Medium on the (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Sensory Innervation of the Anal Canal (R. P. Gould), 337
Separation (Electrophoretic), of certain *in vitro* and *in vivo* Reactions of Rabbit Anti-Mouse Erythrocyte Serum (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Separation (Gas-Solid Chromatographic), of Hydrocarbons of High Molecular Weight (C. G. Scott and D. A. Rowell), 143
Separation (Microanalytical), of Steroids by Gas Chromatography (C. C. Sweeley and Dr. E. C. Horning), 144
Sequence (Amino-Acid), of Human Insulin (Dr. D. S. H. W. Nicol and Dr. L. F. Smith), 483
Sequence (Amino-Acid), about the Reactive Serine of a Proteolytic Enzyme from *Bacillus subtilis* (Dr. F. Sanger and D. C. Shaw), 872
Sera from Pregnant Women : Immuno-electrophoretic Demonstration of Precipitating Components in (Dr. Jan Hirschfeld and Dr. Ulf Soderberg), 332
Sera (Normal Human) : Immuno-Electrophoretic Differentiation of Haptoglobins from another Group-Specific Inheritable System in (Dr. Jan Hirschfeld), 126
Sereda, P. J. : Effect of Temperature on the Expansion on Setting of Gypsum Plaster, 929
Serengeti National Park (Sir Landsborough Thomson), 174
D-Serine (Free), in the Earthworm : Occurrence of (Dr. H. Rosenberg and Prof. A. H. Ennor), 617
Serine (Acetyl-) Peptides : Structures of some, from Acetyl-chymotrypsin (Leo Benoiton, Prof. H. N. Rydon, R. A. Oosterbaan, M. E. Van Adrichem and Prof. J. A. Cohen), 596
Serine (Reactive), of a Proteolytic Enzyme from *Bacillus subtilis* : Amino-Acid Sequence about the (Dr. F. Sanger and D. C. Shaw), 872
Serotonin, a Melanocyte-stimulating Component in the Dorsal Skin Secretion of *Xenopus laevis* (Dr. F. C. G. van de Veerdonk), 948
Serratia marcescens : Delayed Recovery of Airborne, after Short-Time Exposure to Ultra-violet Irradiation (Dr. R. L. Dimmick), 251
  Effect of Glycerine on the X-Ray Sensitivity of (Dr. D. L. Dewey), 1008
Serratia marcescens (*Chromobacterium prodigiosum*) : Association of Pigment with the Cell Envelope of (Mira Purkayastha and Prof. R. P. Williams), 349
Serum of Pregnant Women : Inhibition of Glucuronosyl Transferase by Progestational Agents from (Dr. David Yi-Yung Hsia, Robert M. Dowben, Ralph Shaw and Aaron Grossman), 693
Serum Albumin Concentration in Analbuminaemia and its Immunological Significance (Dr. J. H. Humphrey), 304
Serum Factors Gm^a, Gm^b, Gm^x and Gm-like: Effect of Heat on the (Prof. Arthur G. Steinberg and Rachael Stauffer), 791
Serum Iron and Total Iron-binding Capacity in certain Mammals (Prof. Jose Planas and Sancio de Castro), 1126
Serum Protein (An Abnormal), in Experimental Poisoning by Cadmium and other Metals (D. J. Lawford), 946
Serum (Blood), and Urine of Cattle : Occurrence of Keto-Acids in, in comparison with Man, Horse, Sheep and Dog (Dr. C. J. G. van der Horst), 146
Serum (Human) : Isolation of Material with Proactivator Activity from (H. B. W. Greig and Elsie M. Cornelius), 1125
Serum (Rabbit Anti-Mouse Erythrocyte) : Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of (Chang-Ling Lee, Tamon Takahashi and Israel Davidsohn), 157
Serum (Rat) Acid Phosphatase : Total and *l* (+) Tartaric Acid Inhibited (Dr. Z. Laron and B. Epstein Halberstadt), 67
Service (The Public), in New States—a Study in some Trained Manpower Problems (Kenneth Younger), 971
Setting of Gypsum Plaster : Effect of Temperature on the Expansion on (P. J. Sereda), 929
Severyanka (Submarine) : Oceanographic and Fisheries Research by the (V. P. Zaitzev), 559
Sewage Works (Water and) : Problems of Radioactivity at (Manchester College of Science and Technology Course of Lectures on), 743
Sewers : Control of Rats in (Dr. W. E. Bentley), 288
Sex Ratio of Ammocoetes (M. W. Hardisty), *erratum*, 29
Sgarzi, S., and others : An Antibiotic Complex derived from a *Streptomyces* and Active against Gram-positive Bacteria, 1029
Shape of the Human Red Cells : Adenosine Triphosphate and Maintenance of (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Shape Factors (Particle), in the Sieve Range : A Method for the Routine Measurement of (Dr. Colin C. Harris), 401 ; (D. Howitt), 403
Shaposhnikov, V. V., and others : A New Species of Green Sulphur Bacteria, 167
Sharan, Dr. R. K. : Occurrence and Function of the Provisional Embryonic Cuticle of a Lepidopteran, 1040
Sharnoff, Dr. J. George, and Scardino, Dr. Vito : Platelet-Count Differences in Blood of the Rabbit Right and Left Heart Ventricles, 334
Sharp, Dr. L. K. : Story of Chemical Industry in Basle, *review*, 540
Shaw, Dr. B., and others : Effect of Wheat Gluten on the Peristaltic Reflex, 516
Shaw, D. C. (Sanger, Dr. F., and) : Amino-Acid Sequence about the Reactive Serine of a Proteolytic Enzyme from *Bacillus subtilis*, 872
Shaw, Ralph, and others : Inhibition of Glucuronosyl Transferase by Progestational Agents from Serum of Pregnant Women, 693
Shaylor, H. R. : Appointed Staff Fellow in nuclear physics in the Department of Physics in the University of Birmingham, 465
Shear (Simple) : A Simple Method of Investigating the Creep of Metals under (Prof. E. N. da C. Andrade), 494
Sheep : Use of Diodone in Renal Studies in (B. J. Potter), 698
Sheep infected experimentally with the Virus of Tick-borne Encephalitis : Virus and Antibodies in the Lymph and Blood of (Doubravka Málková), 716
Sheep and Dog (Man, Horse,) : Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in comparison with (Dr. C. J. G. van der Horst), 146
Shell Research Centre : Low-Temperature Fuel Cell, 994
Shemilt, Prof. L. W. (Dullien, F. A. L., and) : Equations for Determining Diffusion Coefficients in Liquid Systems by the Diaphragm-Cell Technique, 767
Shepard, Prof. Francis P. : The Earth beneath the Sea, *review* by Dr. G. E. R. Deacon, 629
Shepherd, Dr. M. : Appointed reader in psychiatry at the University of London Institute of Psychiatry, 117
Sheppard, Herbert, and Zimmerman, Joseph H. : A Suggested Effect on Levels of Catecholamine in Brain produced by Small Doses of Reserpine, 1035
Sheppard, Prof. P. A. : Energy for the Atmosphere, *review*, 974
Sheth, Prof. U. K., and others : Diuretic Activity of 2-Amino-4-meta-chloroanilino-1,3,5,triazine (*R-37*), 1034
Shettles, Dr. Landrum B. : *X* and *Y* Spermatozoa, 254
Shifrine, Moshe, and Biberstein, Prof. Ernst L. : A Growth Factor for *Haemophilus* Species secreted by a Pseudomonad, 623
Shikimic Acids (Quinic and) : Excretion of Catechol after Ingestion of (Dr. A. N. Booth, D. J. Robbins, M. S. Masri and F. DeEds), 691
Shilnikov, V. I., and others : Work of the Antarctic Expeditions of the Academy of Sciences of the U.S.S.R., 287
Shirlaw, D. W. Gilchrist (Willimott, Dr. S. G., and) : *C* Horizon of the Soil Profile, 966
Shive, John N. : The Properties, Physics and Design of Semiconductor Devices, *review* by Dr. J. R. Tillman, 1058
Shooter, Dr. K. V. (Crathorn, Dr. A. R., and) : Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in Mouse Ascites Cells, 614
Shore Crab, *Carcinus maenas* (L.) : Albinism in an American Population o the (Anthony J. Provenzano, jun.), 521
Shorley, Patricia G., and others : Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin, 773
Short, B. F., and others : Abnormal Crimping in Merino and Polwarth Wools, 960
Short, H. G. : The National Physical Laboratory—Open Days, 454
Short-Time Exposure to Ultra-violet Irradiation : Delayed Recovery of Airborne *Serratia marcescens* after (Dr. R. L. Dimmick), 251
Shortages of Scientific Personnel in European Countries in Process of Development, 565
Shotton, F. E. : Appointed director of Terrington and Kirton Experimental Husbandry Farms, King's Lynn, 905
Shrinkage Temperature of Collagen : Hydroxyproline and the (B. J. Rigby and Dr. J. D. Spikes), 150
Shternfeld, Ari : Soviet Space Science (translated by the United States Air Force), *review*, 884
Shuter, W. L. H., and others : A New Limit to the Galactic Magnetic Field set by Measurements of the Zeeman Splitting of the Hydrogen Line, 1088
Shuttleworth, A. C. : Appointed reader in veterinary surgery in the University of Liverpool, 117
Sialoadenectomy and the Distribution of Thyrotrophin labelled with Iodine-131 (Prof. Arthur W. Wase and Dr. Yu Sheng Louise Feng), 778
Sickling Phenomenon in Deer (E. Undritz, K. Betke and Dr. H. Lehmann), 333
Sierra Leone River : Plankton of the Estuary and Offshore Waters of the (V. Bainbridge), 557
Sieve Range : A Method for the Routine Measurement of Particle Shape Factors in the (Dr. Colin C. Harris), 401 ; (D. Howitt), 403
Signals from Satellite *Echo I* : Reflexion of, 901
Signals (Satellite) : Ionospheric Information from (Dr. G. H. Munro), 1017
Signals (Time) : The International Co-ordination of, and Standard Frequency Transmissions (Dr. L. Essen), 452
Significance of the Difference between Two Means when the Population Variances may be Unequal (John B. de V. Weir), 438
Significance of the Type of Host Plant Crop in Successful Biological Control of Insect Pests (D. C. Lloyd), 430
Significance (Immunological) : Serum-Albumin Concentration in Analbuminaemia and its (Dr. J. H. Humphrey), 304
Significance (Taxonomic), of Spermathecal Structure in some Species of *Tribolium* (Gordon Surtees), 1138
Silberrad, Dr. O. J. : *Obituary* by J. S. Grew, 553
Silicate (Lead) Glass : Gamma Irradiation of (R. S. Barker, D. A. Richardson, E. A. G. McConkey and R. Rimmer), 135

Silicon : Isotopic Analysis of, by Solid-Source Mass Spectrometry using Negative Ions (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Silicon bearing 17 per cent Chromium, 8 per cent Nickel and 1 per cent Niobium Steel : A New Phase in a (M. J. O'Hara, D. Wilkinson and R. T. Allsop), 407
Silicon–Boron System (Prof. Cyrill Brosset and Bengt Magnusson), 54
Silicon (Gold–) Alloys : Non-crystalline Structure in Solidified (W. Klement, jun., R. H. Willens and Prof. Pol Duwez), 869
Silicon (An Iron–) Carbide (J. G. Humphreys and Prof. Walter S. Owen), 589
Silkworm, *Bombyx mori* : Function of the Corpus Allatum in 'Dauer-pupa' of the (Dr. Masatoshi Kobayashi), 346
  Nutritive Values of Carbohydrates for the (Dr. Toshio Ito), 527
Silkworm Raising on Artificial Food (Toshifumi Fukuda, Mitsumasa Suto and Yoshikichi Higuchi), 669
Silver : Non-destructive Analysis of Microgram Quantities of, by Radioactivation (Dr. Minoru Okada), 57
AgSCN $P(n\text{-}C_4H_9)_3$: Structure of (Dr. A. Turco, C. Panattoni and E. Frasson), 762
Silver Cup : The Enkomi (Dr. G. F. Claringbull and A. A. Moss), 1051 ; (Dr. Harold J. Plenderleith), 1052
Silverman, Dr. Robert : Appointed assistant professor of mathematics in the University of Pittsburgh, 905
Simaika, Dr. Youssef : Problems of the Arid Zones (Alternative Uses of Limited Water Supplies—United Arabic Republic–Egyptian Region), 296
Simmons, Dr. S. W., and others : DDT—the Insecticide DDT and its Significance (edited by Paul Muller), Vol. 2, Human and Veterinary Medicine (edited by Dr. S. W. Simmons), *review* by Prof. D. S. Bertram, 271
Simms, E. M., and Blake, J. N. : At the Nineteenth Meeting of the Research Panel of the British Gelatine and Glue Research Association (The Swelling of Gelatine Films), 998
Simon, Brian : Studies in the History of Education, 1780-1870, *review* by Dr. James L. Henderson, 357
Simons, Dr. J. P., and Yarwood, A. J. : Photochemical Formation and Stability of the CF_3 Radical, 316
Simony, P. S. : Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Simple Azo-Dye Method for Histochemical Demonstration of Acid Phosphatase (Dr. Tibor Barka), 248
Simple Compounds of Uranium, Thorium, Plutonium, Neptunium : Crystal Chemistry of (E. S. Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E. J. Roberts, 728
Simple Method of Investigating the Creep of Metals under Simple Shear (Prof. E. N. da C. Andrade), 494
Simple Shear : A Simple Method of Investigating the Creep of Metals under (Prof. E. N. da C. Andrade), 494
Simpson, M. V. : Cytoplasmic Particles and their Role in Protein Synthesis (Mitochondria of both Rat Liver and Calf Heart to study the Incorporation of Amino-Acids into Cytochrome *c*), 645
Simpson, Dr. O., and others : Gallium Arsenide for γ-Ray Spectroscopy, 405
Simpson, Prof. S. : Fossils for the Naturalist, *review*, 271
Simuliidae (Immature) : Attachment of, to other Arthropods (Dr. D. J. Lewis, E. T. Reid, R. W. Crosskey and J. B. Davies), 618
Simultaneous Measurement of Adsorption and Electrodekinetic Parameters at Metal Surfaces (A. M. Peers), 503 ; (Dr. E. A. Blomgren and Dr. J. O'M. Bockris), 504
Sinclair, Dr. H. M. : *Obituary* of Sir Robert McCarrison, 195
Singapore Botanic Gardens, 1000
Singer, Prof. Charles : *Obituary* by Dr. E. Ashworth Underwood, 827
Single Contour : Perceptual Anomalies associated with a (J. P. Wilson), 137
Single Crystal (Aluminium) : Borrmann Effect observed in an (Koichi Nakajima and Prof. Shigeyasu Koda), 53
Sinha, Dr. A. : Isolation of a δ-Lactone Compound from the Leaves of *Clitoria marina* Linn., 149
Siphonaceous Green Algae : Xylan of (Yoshihiko Iriki, Takao Suzuki, Kazutosi Nisizawa and Tomoo Miwa), 82
Sircar, Prof. S. M., and Biswas, Manjula : Viability and Germination Inhibitor of the Seed of Rice, 620
Sirotnak, Francis M., and others : Transformation of Resistance to 8-Azaguanine in *Diplococcus pneumoniae*, 800
Site and Nature of Adenovirus Nucleic Acid (Dr. M. A. Epstein and Dr. S. J. Holt), 1050
Sites (Breeding), of Non-Cichlid Fishes in Lake Victoria (Dr. Philip S. Corbet), 616
Six, F., and others : Ionospheric Modification of the Radio Emission from Jupiter, 568
Sixty Years of Progress in English Education (Prof. H. C. Dent), 848
Size of Aggregate : Dependence of Cement-Aggregate Bond-Strength on (K. M. Alexander and J. Wardlaw), 230
Size of Isolated Cells : Measuring the (Dr. Samuel S. Epstein and Jacqueline B. Weiss), 461
Size of Pupil : Effect of, on Visual Acuity (Dr. F. W. Campbell and Dr. A. H. Gregory), 1121
Sjenitzer, F. (Klinkenberg, A., and) : 'Eddy' Diffusion in Chromatography, 1023
Sjogren, Torsten (Hallgren, Bertil, and) : A Clinical and Genetico-Statistical Study of Schizophrenia and Low-Grade Mental Deficiency in a Large Swedish Rural Population, 298
Skin : Behaviour of Radioactive Griseofulvin in (Dr. A. Scott), 705
  Eosinophil Leucocyte-attracting Effect of Histamine in (Dr. R. K. Archer), 155
Skin (Mammalian) : Phosphate Esters produced by, from 2-Deoxy-D-glucose (Dr. S. A. Brooks, Dr. J. C. Lawrence and Dr. C. R. Ricketts), 1028
Skin (Precancerous Mouse) : Mast Cells and 5-Hydroxytryptamine in (Dr. R. E. Coupland and Dr. J. P. Riley), 1128
Skin Secretion (Dorsal), of *Xenopus laevis* : Serotonin, a Melanocyte-stimulating Component in the (Dr. P. C. G. van de Veerdonk), 948
Skin (Nose and) : Bacterial Population of the (H. Williams Smith and W. E. Crabb), 287
Skinner, Dr. N. J., and others : Equatorial Spread-*F* and *F*-Layer Heights, 1086
Skoglund, Dr. Sten : Hind-Limb Reflexes in the Kitten—Velocity of Conduction and Spinal Transmission of Proprioceptive Hind-Limb Reflexes, 132 ; Properties of the Two Neuron Arc, 134
Skull (Piltdown) : Artificial Thickening of Bone and the (Prof. Ashley Montagu), 174 ; (Dr. Kenneth P. Oakley), 174
Sky : The Night, in August, 289 ; in September, 650 ; in October, 1079
Skylark Rocket Sodium Experiment : Upper-Atmosphere Wind Studies by (Dr. G. V. Groves), 1001
Slater, C. H., and others : A New Limit to the Galactic Magnetic Field set by Measurements of the Zeeman Splitting of the Hydrogen Line, 1088
Slater, Prof. E. C. (Laser, Dr. H., and) : Effect of Heavy Water on Respiratory-chain Enzymes, 1115
Slater, Dr. J. D. H., and others : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thiourea or Thiouracils, 691 ; *erratum*, 1079
Slater, Colonel L. : At the second Annual Conference of the British Computer Society (Installation of Data-processing Schemes for the Payment of the Military), 656
Slater, Dr. L. J. : Confluent Hypergeometric Functions, *review* by Prof. W. N. Bailey, 93
Slater, Sir William : Appointed chairman of the governing body of the Glasshouse Crops Research Institute, 1079
Slatyer, Dr. R. O., and Taylor, Prof. S. A. : Terminology in Plant- and Soil-Water Relations, 922
Slawson, William F., and Austin, Carl F. : Anomalous Leads from a Selected Geological Environment in West-Central New Mexico, 400
Sleep (Hexobarbitone-induced), in Mice : Effect of Hydration on (Dr. N. K. Bhide), 1030
Slip (*Ko*) and Viscous (*Bo*) Flow Coefficients of Permeable Solids : Measurement of (J. G. Biram), 865
Slopek, S., and others : Anti-neoplastic Activity of Tetrahydro-1,3-oxazine Derivatives, 426
Sluckin, Dr. W. : Appointed lecturer in psychology at the University of Leicester, 743
Small, J. R. : Appointed lecturer in accounting and business methods at the University of Edinburgh, 465
Small Bodies : Dispersal in Space of (Dr. D. O. Wolfenbarger), 1078
Small Doses of Reserpine : A Suggested Effect on Levels of Catecholamine in Brain produced by (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Small Experiments : Analysis of (P. Sprent), 437
Small Pacific Island : Continuity in a, *review* by Sir Harry Luke, 816
Small-Scale Turbulent Diffusion in the Atmosphere (Dr. L. A. Clarenburg and C. E. Speans v. d. Tang), 586
Smillie, Dr. Robert : Alkaline C-1 Fructose-1,6-diphosphatase—Evidence for its Participation in Photosynthesis, 1024
Smit, Dr. J., and Wijn, Dr. H. P. J. : Ferrites, *review* by Dr. G. E. Bacon, 974
Smith, Prof. A. G. : Elected first holder of the Hives chair of thermodynamics in the University of Nottingham, 743
Smith, Prof. A. G., and others : Ionospheric Modification of the Radio Emission from Jupiter, 568
Smith, Dr. Audrey U. : Freezing and Drying of Biological Materials, 748
Smith, B. S. : Health Physics Instrumentation, *review*, 9
  U.K. Atomic Energy Research Establishment—Wantage Research Laboratory, 292
Smith, Dr. C. L. : Appointed reader in zoology in the University of Liverpool, 117
Smith, Prof. Carter R. : Effect of Autumn Applications of Potassium Gibberellate on Fruit Production of the Strawberry, 620
Smith, C. T., and others : The Making of the Broads, *review* by Miles Burkitt, 636
Smith, D. E. (May, B. R., and) : Final Months and Descent of Satellite *Sputnik* 3, 456
  The Sudden Discontinuity in the Orbital Period of *Sputnik* 4 Satellite, 866
Smith, Deane K. : Bibliography on Molecular and Crystal Structure Models (United States National Bureau of Standards, Monograph No. 14), 903
Smith, E. (Jeffery, R. A., and) : Work-Hardening and Ductility of Rhenium and their relation to the Behaviours of other Metals having a Hexagonal Structure, 52
Smith, E. B. (compiled by) : Safety in Mines Research Establishment Bibliography, 1960, second edition, *review* by Prof. S. G. Ward, 1063
Smith, Dr. E. Lester : Vitamin B_{12}, *review* by Prof. John Yudkin, 889
Smith, Dr. F. G. : Grant of £11,230 for Space Research (for the measurement of cosmic radio noise by receivers mounted on rockets and satellites), 744
Smith, G. K., and Burns, Prof. B. Delisle : A Biological Interval Analyser, 512
Smith, H. Williams, and Crabb, W. E. : Bacterial Population of the Nose and Skin, 288
Smith, Dr. J. A. B. : The National Institute for Research in Dairying, 909
Smith, K. R. E. : Nutzenergie aus Atomkernen, *review*, 979
Smith, Dr. L. F. (Nicol, Dr. D. S. H. W., and) : Amino-Acid Sequence of Human Insulin, 483
Smith, Dr. M. J. H. (Marks, Dr. V., and) : Anti-Inflammatory Activity of Salicylate, 610
Smith, Dr. R. A. : Semiconductors, *review* by Prof. G. F. J. Garlick, 885
Smith, Ray F. (edited by Edward A. Steinhaus and) : Annual Review of Entomology, Vol. 5, *review* by Prof. V. B. Wigglesworth, 542
Smith, R. J. Ord : Automatic Programming in the U.S.S.R., *review*, 92
Smith, Prof. W. : Title of professor emeritus of bacteriology in the University of London conferred on, 466
Smith-Rose, Dr. R. L. : Principles and Practice of Television Engineering, *review*, 358
  Appointed chairman of the General Post Office Frequency Advisory Committee, 466
  Communications and Electronics Dictionaries, *review*, 1059
Smithsonian Institution, Washington : Langley Medal awarded posthumously to Dr. Robert H. Goddard, 20[illegible]
  Appointment of James C. Bradley as assistant secretary (management), 743
Smolker, Robert E. (Hackel, Prof. Emanuel, and) : Effect of Ribonuclease on Erythrocyte Antigens, 1036
Smooth Muscle (Nerve—) Transmission : Autonomic (G. Burnstock and Mollie E. Holman), 951

Smythe, L. E. (Florence, T. M., and) : Use of Azo Dyestuffs for the Polarographic Determination of the Lanthanides, 771
Smythies, John R. (edited by Carl C. Pfeiffer and) : International Review of Neurobiology, Vol. I, *review* by Dr. D. H. Brinton, 447
Snail *Paludina vivipara* Lin. : *Diplodiscus* Species Parasitic in the (M. R. Honer), 431
Sneath, Dr. P. H. A. : Microbial Systematics, 191
Sneed, Prof. M. Cannon, and Brasted, Prof. Robert C. (edited by) : Comprehensive Inorganic Chemistry, Vol. 7, The Elements and Compounds of Group IVA (Harold P. Klug and Prof. Robert C. Brasted), *review* by Dr. K. W. Bagnall, 185
Snider, C. S., and others : A Comparison of Atomic Beam Frequency Standards, 681
Snows (Antarctic) : Isotopic Composition and Temperature of Formation of (Prof. E. Picciotto, X. de Maere and Dr. I. Friedman), 857
Soal, Dr. S. G. : Experimental Evidence for Extra-Sensory Perception, 171
Sobolev, Prof. V. V. : Moving Envelopes of Stars (translated by Sergei Gaposchkin), *review* by Prof. W. H. McCrea, 538
Sobotka, Harry, and Stewart, C. P. (edited by) : Advances in Clinical Chemistry, Vol. 2, *review* by Dr. R. Consden, 890
Social Change in Tikopia (Prof. Raymond Firth), *review* by Sir Harry Luke, 816
Social Development through the Family and Home : Report of the Conference on, 567
Social Science : Medicine as a, *review* by Prof. E. Maurice Backett, 633
Social Sciences : The Literature of the (Peter R. Lewis), *review*, 729
Social Structure : Religion and, *review* by Michael Argyle, 96
Società Italiana di Fisica : International Summer Course on Solid State Physics, 201
Société de Chimie Physique : Annual Meeting (Structure, Synthesis and Function of Deoxyribonucleic Acid), 1079
Société Française d'Histochimie : First International Congress of Histochemistry and Cytochemistry, 29
Société Française de Métallurgie : Meeting on the Heat Treatment of Metals and Alloys, 559
Society : Interactions of Science and Technology with, 1
Society and Health : Culture, (Division of Anthropology of the New York Academy of Sciences and the Research Institute for the Study of Man Conference on), 658
Sociological Studies at the University of Sheffield, 463
Soderberg, Dr. Ulf (Hirschfeld, Dr. Jan, and) : Immuno-electrophoretic Demonstration of Precipitating Components in Sera from Pregnant Women, 332
Sodermann, R. A., and Frisco, L. F. (edited by) : Digest of Literature on Dielectrics, Vol. 22, 1958 (United States National Academy of Sciences—National Research Council, Publication No. 713), *review* by S. Weintroub, 728
Sodium : Critical Energy Barriers in the Excretion of (Prof. E. J. Conway), 394
Sodium Butyrate : Reduction of the Intestinal Absorption of Glucose, Methionine and, by the Cation Trimethylhexadecylammonium (Dr. J. A. Nissim), 308
Sodium Chloride : Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Sodium Experiment (Skylark Rocket) : Upper-Atmosphere Wind Studies by (Dr. G. V. Groves), 1001
N Sodium Hydroxide : Ammonia released on Treating Soils with, as a Possible Means of Predicting the Nitrogen-supplying Power of Soils (A. H. Cornfield), 260
Sodium Hydroxide in Water : Interaction of Picric Acid with (Takehiro Abe), 234
Sodium Molecules (Lithium and) : Excited Electronic States of (Dr. R. F. Barrow, N. Travis and C. V. Wright), 141
Sodium and Potassium in Mitochondrial Membrane Fractions (Dr. Frank Ulrich), 949
Softening Chitin for Histology (Dr. D. B. Carlisle), 1132
Soil : Herbicides and the (British Weed Control Council Symposium on), 376
Relative Availability of some Strontium-90 Compounds in (Dr. R. L. Uhler and Dr. F. P. Hungate), 252
Soil (Relic-) on Limestone in South Wales (D. F. Ball), 497
Soil Engineering : Laboratory Testing in (T. N. W. Akroyd), *review* by Dr. H. L. Penman, 891
Soil Profile : *C* Horizon of the (Dr. S. G. Willimott and D. W. Gilchrist Shirlaw), 966
Soil-Water Relations (Plant- and) : Terminology in (Dr. R. O. Slatyer and Prof. S. A. Taylor), 922
Soils : Ammonia released on Treating Soils with *N* Sodium Hydroxide as a Possible Means of Predicting the Nitrogen-supplying Power of (A. H. Cornfield), 260
The Geochemistry of Rare and Dispersed Chemical Elements in (A. P. Vinogradov), second edition, (translated from the Russian), *review* by A. H. Debnam, 629
Minor Elements in, *review* by A. H. Debnam, 629
Soils (British) : Potassium-supplying Power of some (Dr. P. W. Arnold), 436
Soils (Swedish) : Content of Caesium-137 and (Zirconium + Niobium)-95 in (Kerstin Low and K. Edvarson), 736
Soils (Treating) with *N* Sodium Hydroxide : Ammonia released on, as a Possible Means of Predicting the Nitrogen-supplying Power of Soils (A. H. Cornfield), 260
Soils (Wet and Dry) : Potash in, *review* by Dr. P. W. Arnold, 976
Soils, Plants and Bones : Radioactivity of (Sir Ernest Marsden), 192
Sokal, Dr. R. R. : Microbial Systematics, 191
Solar Atmosphere : Temperatures reached in Electrical Discharges in the (Dr. C. E. R. Bruce), 865
Solar Flare of June 1, 1960 (Prof. M. A. Ellison, Susan M. P. McKenna and J. H. Reid), 926
Solar System : The Exploration of the (Felix Godwin), *review* by D. G. King-Hele, 811
Origin of the (Dr. M. M. Woolfson), 47 ; (M. H. Briggs), 1102
Solid—Solid Interactions on Active Adsorbents (Dr. Philip Anthony and Prof. Harry Zeitlin), 936
Solid-Source Mass Spectrometry using Negative Ions : Isotopic Analysis of Silicon by (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Solid State Physics (Società Italiana di Fisica International Summer Course on), 201
Solid State Physics, *review* by Dr. R. O. Davies, 886
Solid State Physics—Advances in Research and Applications (edited by Frederick Seitz and David Turnbull), Vols. 7, 8, 9 and 10, *review* by Dr. R. O. Davies, 886 ; Supplement 2, Paramagnetic Resonance in Solids (William Low), *review* by Dr. R. O. Davies, 886
Covalent Super-Exchange in (Prof. W. S. Fyfe and Prof. J. Verhoogen), 1108
Solid (Gas-) Chromatographic Separation of Hydrocarbons of High Molecular Weight (C. G. Scott and D. A. Rowell), 143
Solidified Gold—Silicon Alloys : Non-crystalline Structure in (W. Klement, Jun., R. H. Willens and Prof. Pol Duwez), 869
Solids : Paramagnetic Resonance in (William Low), (Solid State Physics—Advances in Research and Applications, Supplement 2), *review* by Dr. R. O. Davies, 886
The Strength of (Prof. A. H. Cottrell), 659
Solids (Permeable) : Measurement of Slip (*Ko*) and Viscous (*Bo*) Flow Coefficients of (J. G. Birum), 865
Solomon, Dr. A. K., and others : Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of Kidney Slices from *Necturus*, 699
Solomon, Dr. A. K. (Schultz, Dr. Stanley G., and) : A Bacterial Mutant with Impaired Potassium Transport, 802
Solonenko, V. P., and Florensov, N. A. : Tectonics of the Gobi Mountains, 373
Solubility Data : Analyses of, to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber (L. Mullins and D. T. Turner), 145
Soluble Bacterial Antigens : Antibody Responses of the Domestic Fowl to Two (Dr. G. Gowland), 624
Soluble Matrix Antifouling Compositions : Mode of Action of (A. Partington), 1105
Solutes : Plants in relation to Water and (Plant Physiology, edited by F. C. Steward, Vol. 2), *review* by Prof. Walter Stiles, 869
Solutions : Expression of Concentrations of (E. H. Leach), 350
Solutions of Hyaluronic Acid : Exclusion of Inulin from (Dr. A. G. Ogston and C. F. Phelps), 1024
Solutions (Aqueous) : Effects of *p*H and the Nature of the Primary Species in the Radiolysis of (J. T. Allan and Dr. G. Scholes), 218
A New Method for the Differential Precipitation of Nucleic Acids from (William G. Aldridge), 323
Solutions (Aqueous Electrolyte) : Ultrasonic Velocities in (Dr. C. G. Balachandran), 136
Solutions (Ferrous) : Radiolytic Oxidation of, with Standardized Internal Sources of Phosphorus-32 (Dr. M. Pesach and J. Steyn), 58
Solutions (Highly Enriched Oxygen-18 Water), containing Hydrogen Peroxide-16,16 : Radiolysis of (Dr. Michael Anbar, Shmuel Guttmann and Prof. Gabriel Stein), 57
Solutions (Urea—Lithium Bromide) : Viscosity of Concentrated (Dr. Irving I. Geschwind), 324
Solvey, Dr. E. J. : Research and Development in Industry (Presidential Address to the Society of Chemical Industry), 830
Solvent Systems (Mixed) : Activity of Bovine Pancreatic Ribonuclease *A* in (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Solvents (Two Highly Selective), for Gas-Liquid Chromatography Analysis of C_5–C_6 Hydrocarbons (Dr. A. van der Wiel), 142
Somatic Cell Nuclei : Absorbance of Feulgen-stained (Dr. Simon Iversen), 86
Somers, Dr. E. : Fungitoxicity of Metal Ions, 427
Sondheimer, Prof. E. H. : Appointed to the chair of mathematics in Westfield College, London, 363 ; work of, 363
Soper, Dr. J. M. : Les Modèles du Noyau, *review*, 979
Sørensen, Prof. N. A. : The Chemistry of Natural Products (Structural Patterns of Polyacetylenic Compounds isolated from the Plant Family Compositae), 1080
Šorm, Prof. F. : The Chemistry of Natural Products (Terpenic Compounds with Medium-sized Rings), 1080
Sorokin, Helen P., and Thimann, Prof. Kenneth V. : Plastids of the *Avena* Coleoptile 1038
Sorsby, Prof. Arnold, and Harding, Ronald : Protective Effect of Cysteine against Retinal Degeneration induced by Iodate and by Iodoacetate, 608
Sound Transmission : Introduction to the Theory of, with Application to the Ocean (Prof. C. B. Officer), *review* by Dr. A. B. Wood, 539
Sound and Television : Science Broadcasting in (A. B. Oldfield Davies), 850
Sound-producing Fish : Electrophysiological Observations on a (A. Packard), 63
Sounding Experiments (Echo), in the Barents Sea (I. D. Richardson, D. H. Cushing, F. R. Harden Jones, R. J. H. Beverton and R. W. Blacker), 855
Source of Food for Black-Fly Larvae : Bacteria as a (F. J. H. Fredeen), 963
Source of Sodium Chloride : Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the, and the Distribution of Atmospheric Nitrate over the United States (Dr. Henry M. Papée and Dr. Alberto Montefinale), 1103
Source-Book of Semiconductor Physics, *review* by Prof. G. F. J. Garlick, 885
Souter, L. S. : Awarded a Travel Award for Women Engineers by the Caroline Haslett Memorial Trust, 116
South Africa : Polychaete Fauna of (Prof. J. H. Day), Part 5, 199
South African Animal Life—Results of the Lund University Expedition in 1950-1951, Vol. 6 (edited by Bertil Hanström, Per Brinck and Gustav Rudebeck), *review* by H. Oldroyd, 1063
South African Bantu : The Rh Factor C in (Dr. A. Zoutendyk and Dr. H. Teodorczuk), 790
South African Broadcasting Corporation : Van Riebeeck Lectures, Africa's Place in the Emergence of Civilisation (Prof. Raymond A. Dart), *review* by M. C. Burkitt, 891
South African Museum : *Annals* of the Vol. 45, Part 3, 199
South African University Students : Daily Food Consumption by (Sonia E. Walker), 381
South America : Cosmic Radiation Studies in, 648
South Atlantic : Pelagic Polychaetes of the (N. Tebble), 289
Potassium—Argon Ages of some Rocks from the (John A. Miller), 1019

South Australia Museum : Annual Report for 1958-59, 287
South Indian People : Potassium Tolerance Tests in (Dr. G. Henrotte, G. Krishnamurthi and G. Ranganathan), 328
South Pole : Observations of 'Whistlers' and 'Chorus' at the (Dr. L. H. Martin), 1018
South Wales : Relic-Soil on Limestone in (D. P. Ball), 497
Southern Atmospheric Cyclones and the Whale Feeding Grounds in the Antarctic (Dr. C. W. Beklemishev), 530
Southern Rhodesia : Environment and Culture in (Roger Summers), 993
Southgate, Dr. B. A. : The Metropolitan Water Board, 468
Southward, Dr. A. J. : Marine Biological Reports from Denmark, *review*, 360
Soviet Science in English Catalogue, 1960 (Program for Science Translations, Jerusalem), 832
Soviet Space Science (Ari Shternfeld), translated by the United States Air Force, *review*, 884
Soviet Union : Atomic Energy in the (Arnold Kramish), *review* by Dr. S. C. Curran, 630
Sowby, Dr. F. D., and Taylor, Dr. D. M. : Removal of Internally Deposited Americium by Chelating Agents, 612
Sows : Experiments on the Nutrition of (Dr. G. A. Lodge), 115
Space : Dispersal in, of Small Bodies (Dr. D. O. Wolfenbarger), 1078
Space around the Earth : Geomagnetic Storms and the (Prof. Sydney Chapman), 824
Space (Vector), and its Applications in Crystal-Structure Investigation (Prof. Martin J. Buerger), *review* by Dr. J. W. Jeffery, 975
Space Flight : Proposals for, *review* by D. G. King-Hele, 811
Space Research, *review* by Sir Harold Spencer Jones, 268
  Resources for Atomic Energy and, 1055
Space Research in Britain : Grants for, 744
Space Science : Soviet (Ari Shternfeld), translated by the United States Air Force, *review*, 884
Space Technology (edited by Prof. Howard S. Seifert), *review*, 884
Space Telecommunications : Radio Frequency Control in (Edward Wenk, jun.), 373
Space Travel : Biology of (Institute of Biology Symposium on), 29
  Designing for, *review*, 884
Space, Time and Gravitation : The Theory of (V. Fock), translated from the Russian by N. Kemmer, *review* by Dr. D. W. Sciama, 4
Spacing (Interlayer), in Carbons of Different Graphitic Perfection : Dependence on Temperature of the (E. G. Steward, B. P. Cook and E. A. Kellett), 1015
Spain, David M. : Culture, Society and Health (Study of Coronary Artery Disease), 659
Spärck, Prof. R., and others (edited by) : Galathea Report—Scientific Results of the Danish Deep-Sea Expedition round the World, 1950-52, *review* by Dr. N. B. Marshall, 443
Spaul, Prof. E. A. : Retirement from the chair of zoology in the University of Leeds, 197 ; work of, 197
Speake, G. D. : Appointed deputy chief of research at Marconi's Research and Development Laboratories, 290
Speakman, Prof. J. B (Wolfram, Dr. L. J., and) : Reactivity of the Disulphide Bond in Wool, 595
Special Assistance for Effluent Liaison (British Leather Manufacturers' Research Association), 992
Species : Darwin's Notebooks on Transmutation of (edited by Sir Gavin de Beer), Part 2, 26 ; Part 3, 649 (British Museum (Natural History)).
Species of *Tribolium* : Taxonomic Significance of Spermathecal Structure in some (Gordon Surtees), 1138
Species (Five), of Birds : Variability in Levels of Blood Uric Acid in (Jack W. Hudson and Charles R. Taylor), 788
Species (A New), of Green Sulphur Bacteria (V. V. Shaposhnikov, E. N. Kondratieva and V. D. Federov), 167
Species (Primary), in the Radiolysis of Aqueous Solutions : Effects of *p*H and the Nature of the (J. T. Allan and Dr. G. Scholes), 218
Species (Two), of Elateridae : Pathogenicity of *Metarrhizium anisopliae* (Metch.) Sor. and *Beauveria bassiana* (Bals.) Vuill. to (Dr. R. D. Tinline and R. Y. Zacharuk), 794
Species Level : Evolution above the (Prof. Bernhard Rensch), *review* by C. S. Elton, 446
Specific Inhibitors of the Adrenal Cortex (Prof. J. H. U. Brown), 985
Specificity of Polyglycosidases : Steric Factors affecting the (F. W. Parrish and A. S. Perlin), 1110
'Speckle' (Banana Fruit-spot) caused by *Deightoniella torulosa* (Syd.) Ell. (Dr. D S. Meredith), 961
Spector, W. G. : Anti-Fertility Action of a Monoamine Oxidase Inhibitor, 514
Spectra (Carbon Dioxide Mass) : High-Energy Oxygen Ions in (R. M. S. Hall), 683
Spectra (Electronic Absorption), and Chemical Reactivity with Mercaptalbumin : An Ortho Effect influencing Fungitoxicity, (Dr. H. P. Burchfield and Eleanor E. Storrs), 593
Spectra (Infra-Red), of Amino-Acids and related Substances in Water (Prof. Frank S. Parker and Prof Donald M. Kirschenbaum), 386
Spectra (Ultra-violet Absorption), of the Diazines (Prof. K Keith Innes, James A Merritt, Wayne C. Tincher and Shelby G. Tilford), 500
Spectra (Ultra-Violet Absorption), of the Molecules H_2O, HDO and D_2O (Dr. Jack Barrett and Dr A. L. Mansell), 138 ; (R M. Golding), 139
Spectra (Ultra-violet Absorption), of Proteins in Deuterium Oxide (Dr. Shiro Takashima), 597
Spectral Analysis (Direct Infra-Red), of the Cucumber Mosaic Virus Infection Process (Prof. G. W. Cochran, G. W. Welkie and J. L. Chidester), 1049
Spectral Reflectivity of Ore Minerals (I. Gray and Dr. A. P. Millman), 282
Spectrometric Investigation (Mass), of the Vaporization of Sulphides and the Dissociation Energy of Se (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Spectrometry (Gamma-Ray) : Non-destructive Analysis of Selenium by Neutron Activation followed by (Dr. Minoru Okada), 594
Spectrometry (Solid-Source Mass), using Negative Ions : Isotopic Analysis of Silicon by (Dr. D. C. Newton, J. Sanders and A. C. Tyrrell), 683
Spectrophotometric Determination (Atomic Absorption), of Molybdenum and Strontium (D. J. David), 1109
Spectroscopy : New Frontiers in Optics and (Pittsburgh Conference and the Optical Society of America Symposium on), 289
Spectroscopy (Applied) : Analytical Chemistry and (Twelfth Pittsburgh Conference on), 289
Spectroscopy (γ-Ray) : Gallium Arsenide for (W. R. Harding, C. Hilsum, M. E. Moncaster, D. C. Northrop and Dr O. Simpson), 405
Spectroscopy (Proton Magnetic Resonance) : Structure Determination with the Help of (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. F. Blakely, Dr. R. F. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Specular Reflexions : Effect of, on the Radiation Flux from a Heated Tube (Sir K. S. Krishnan), 135
Speed of the Superconducting-Normal Transition in Tin Films (D. J. Oliver, M J. Rayner and E. H. Rhoderick), 492
Spence, Dr. R. : Appointed deputy director of the Atomic Energy Research Establishment, 556
Spencer, Dr. B., and others : Effect of Trypan Blue on Rat Embryos, 605
Spencer, Dr. M., and Worthington, Dr. C. R. : A Hypothesis of Contraction in Striated Muscle, 388
Spenke, Dr. E. : Les Semiconducteurs Électroniques (traduit par L. Godefroy), *review* by Dr. J. R. Tillman, 1058
Spensley, Dr. P. C. : Appointed acting director of the Tropical Products Institute, 117
Spermathecal Structure in some Species of *Tribolium* : Taxonomic Significance of (Gordon Surtees), 1138
Spermatozoa : X and Y (Rt. Hon. Lord Rothschild), 253 ; (Dr. Landrum B. Shettles), 254 ; (Prof. David W Bishop), 255
Spermatozoa (Bull) : Effect of Acridine Orange on Living (C. van Duijn, jun.), 1006
Sphaerocarpos (Liverwort) : Maternal Inheritance and Interspecific Hybrids of the (Dr. William T. Doyle), 429
Spheres (Hard) : Packing of Mixtures of (Prof. Paul C. Mangelsdorf, jun., and Elmer L. Washington), 930
Spikes, Dr. J. D. (Rigby, B. J., and) . Hydroxyproline and the Shrinkage Temperature of Collagen, 150
Spilopsyllus cuniculi Dale (Rabbit Flea) : Breeding of the—Requirement of a 'Factor' from a Pregnant Rabbit for Ovarian Maturation (A. R. Mead-Briggs and A. J. B. Rudge), 1136
Spin Resonance Techniques : Diamagnetic Moment of Gaseous Plasmas measured by (T. C. Marshall, R. A. Kawcyn and Prof. L. Goldstein), 584
Spinal Transmission of Proprioceptive Hind-Limb Reflexes : Velocity of Conduction and (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 132
Spinel (Olivine–) Transition on Nickel Orthosilicate (Dr. A. E. Ringwood), 1019
Spiritual Crisis of the Scientific Age (G. D. Yarnold), *review* by R. Brightman, 818
Splachnum ampullaceum (L.) Hedw. : Intracellular Configuration and Dedifferentiation in (Prof. Kraft E. von Maltzahn and Mary M. MacNutt), 344
Spleen : A Polyploidizing Principle in the (L. Bouvier, Prof. R. Rigler and W. Rosenkranz), 965
Spleen Cells (Homologous Adult), injected into New-born Mice : Fate of (A. J. S. Davies and Sheila M. A. Doak), 610
Splitting (Zeeman), of the Hydrogen Line : A New Limit to the Galactic Magnetic Field set by Measurements of the (Dr. R. D. Davies, C. H. Slater, W. L. H. Shuter and P. A. T. Wild), 1088
Spontaneous Fission of Californium-252 : Rare Modes in the (Prof. E. W. Titterton and T. A. Brinkley), 228
Spontaneous Osteogenic Sarcoma : A Transplantable, observed in the Muscle Tissue of an Albino Mouse (R. G. Herne, M. Gregoire and G. Rona), 1129
Spooner, Prof E. T. C. : Appointed dean of the London School of Hygiene and Tropical Medicine, 466
Sporadic E and the Earth's Magnetic Field : Longitude Effect in Temperate Zone (L H. Heisler and Dr. J. D. Whitehead), 676
Spotswood, T. M., and others : Mode of Formation of 3,4-Benzopyrene in Human Environment, 663
Spotting Ketosteroids, *review* by Prof. G. A. D. Haslewood, 183
Spread *F* Echoes at Low Latitudes : Possibility of Detecting Ionospheric Drifts from the Occurrence of (R. W. Knecht), 927
Spread-*F* and *F*-Layer Heights : Equatorial (Dr. A. J. Lyon, Dr. N. J. Skinner and Prof. R. W. Wright), 1086
Sprent, P. : Analysis of Small Experiments, 437
Spurny, Dr. K. (Kubie, Dr G., and) : Radioactive Labelling of Membrane Filters for the Assay of Air-borne Material, 930
Sputnik 3 Satellite : Final Months and Descent of (B. R. May and D. E. Smith), 456
Sputnik 4 Satellite : The Sudden Discontinuity in the Orbital Period of (B. R. May and D. E. Smith), 966
Sputnik 5 Satellite, 830
Squalene : Biosynthesis of, by the Annelid *Lumbricus terrestris* (Joyce M. Wootton and Lemuel D. Wright), 1027
Srivastava, Dr. P. N. : Bacterial Effect and Radiophosphorus Assimilation in Organic and Inorganic Forms in Salmon, 83
St. Mary's Hospital Medical School, London : Appointment of Dr. Richard Creese to the readership in physiology, 743
Stability of the CF_2 Radical : Photochemical Formation and (Dr. J. P. Simons and A. J. Yarwood), 316
Stability of Epidote Minerals (Prof. W. S. Fyfe), 497
Stability and Control of Flight, *review*, 444
Stabilization of Austenite by Hydrogen (E. G. Ramachandran and C. Dasarathy), 684
Stabilization by Manganous Ions of Ribosomes from Embryonic Plant Tissue (Dr J. W. Lyttleton), 1026
Stack-Forsyth, Dr. E. F. : Appointed lecturer in electrical engineering at the University of Birmingham, 465
Stages (Initial), of Oxidation of Coal (S. K. Chakrabartty, B. K. Mazumdar and A. Lahiri), 502
Stainforth, Dr. R M. : The American Oligocene, 678
Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thiourea or Thiouracils (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691 ; *erratum*, 1079
Stains (Ageing Blood-) : Use of Reflectance Measurements in assessing the Colour Changes of (Dr. D. Patterson), 688

Stains (Dried Blood-), on Fabrics : Absorption-Elution Grouping of (S. S. Kind), 789
Stamburgo, M., and others : Synergistic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia, *erratum*, 559
Stamp, Dr. J. T. : Tuberculosis in Animals (Comparative Pathology), 996
Stamp, Prof. L. Dudley : Our Developing World, *review* by M. K. Milne, 816
Standard Frequency Transmissions : The International Co-ordination of Time Signals and (Dr. L. Essen), 452
Standardized Internal Sources of Phosphorus-32 : Radiolytic Oxidation of Ferrous Solutions with (Dr. M. Pelsach and J. Steyn), 58
Standards, United States National Bureau of : Monograph No. 14, Bibliography on Molecular and Crystal Structure Models (Deane K. Smith), 903
  Monograph No. 10, The Helium-4 Scale of Temperature (F. C. Brickwedde, H. van Dijk, M. Durieux, J. R. Clement and J. K. Logan), 1077
Standards (Frequency) : A Comparison of Atomic Beam (R. E. Beehler, R. C. Mockler and C. S. Snider), 681
Standing Waves (Electromagnetic), and Ball Lightning (Dr. Lewi Tonks), 1013
Staphylococcal Diseases : Antibiotic Therapy and (edited by Dr. Henry Welch and Prof. Maxwell Finland), *review* by Prof. R. Knox, 637
Staples, Dr Richard C., and Burchfield, Dr. H. P. : Incorporation of Acetate into Protein by Obligately Parasitic and Saprophytic Fungi, 1040
Star-Projector : Operation of a (Science Museum, London), 117
Starch Biosynthesis : Mechanism of (Dr. Marta A. Rongine de Fekete, Dr. Luis F. Leloir and Dr. Carlos E. Cardini), 918
Starch-like Polysaccharide of *Streptococcus pyogenes* (Dr. H. Baum and Dr. N. Crowley), 413
Starch-Gel Electrophoresis of Wheat Proteins (Dr. G. A. H. Elton and J. A. D. Ewart), 600
Stars : Moving Envelopes of (Prof. V. V. Sobolev), translated by Sergei Gaposchkin, *review* by Prof. W. H. McCrea, 538
State : The Child, the Parent and the (Dr. James Bryant Conant), *review* by Brian Holmes, 635
State Government : Science and—a Study of the Scientific Activities of State Government Agencies in Six States (Dr. Frederic N. Cleaveland), *review* by R. Brightman, 181
States (New) : The Public Service in—a Study in some Trained Manpower Problems (Kenneth Younger), 971
Statesman of Science : Francis Bacon, the First (J. G. Crowther), *review* by Prof. B. Farrington, 817
Statically Indeterminate Frameworks : A Historical Note on the Reciprocal Theorem and Theory of (T. M. Charlton), 231
Statics and the Engineer (Sir Alfred Pugsley), 844
Statistical Mechanics (with special reference to Irreversibility), (Institute of Physics and the Physical Society Conference on), 1079
Stauffer, Rachel (Steinberg, Prof. Arthur G., and) : Effect of Heat on the Serum Factors Gm^a, Gm^b, Gm^x and Gm-like, 791
Steam Engine to Satellite : Science as History—the Story of Man's Technological Progress from (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J. L. Stollery, 8
Steel : Growth of Sulphide Films on (R. B. Campbell, L. Gronberg and H. M. Scott), 588
Steel (Mild) : Correlation of the Alternating Stresses required to Initiate and Propagate a Fatigue Crack in (N. E. Frost), 233
Steel (Niobium) (1 per cent) : A New Phase in a Silicon bearing 17 per cent Chromium, 8 per cent Nickel and (M. J. O'Hara, D. Wilkinson and R. T. Allsop), 407
Steel Castings Research Association (British) : Open Days (Dr. A. H. Sully), 657
  Seventh Annual Report, 658
Steele, L. P. (Bannon, J. K., and) : Average Water Vapour Content of the Air, 748
Steels : Precipitation Processes in—Report of a Conference held in the University of Sheffield, 1958, *review* by Prof. F. C. Thompson, 9
Steim, Joseph M. (Hanig, Martin, and) : Physical Incompleteness of Influenza Virus propagated in De-embryonated Eggs, 40
Stein, Prof. Gabriel, and others : Radiolysis of Highly Enriched Oxygen-18 Water Solutions containing Hydrogen Peroxide-16,16, 57
Stein, Dr. Joseph A., and others : Reversibility of an Inherited Metabolic Block (Inborn Error of Metabolism), 515
Steinberg, Prof. Arthur G., and Stauffer, Rachel : Effect of Heat on the Serum Factors Gm^a, Gm^b, Gm^x and Gm-like, 791
Steinhaus, Edward A., and Smith, Ray F. (edited by) : Annual Review of Entomology, Vol. 5, *review* by Prof. V. B. Wigglesworth, 542
Stellar Motions (Dr. R. v. d. R. Woolley), 841
Stelzner, J. (Vanek, Dr. J., and) : Oscillatory Character of Amplitude Curves for Seismic Body Waves, 491
Stephen, Dr. Karin : The Wish to Fall Ill—a Study of Psychoanalysis and Medicine, *review* by Dr. Clifford Allen, 978
Stephenson, Dr. J. L. : Freezing and Drying of Biological Materials, 749
Stepwise Ablation and Heat Transfer in Cold-Cathode Arcs (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Stereographic Projection : Use of, in Structural Geology (Dr. F. C. Phillips), second edition, *review* by John Sutton, 729
Steric Factors affecting the Specificity of Polyglycosidases (F. W. Parrish and A. S. Perlin), 1110
Sterilization of Pharmaceutical Products : Use of Gamma-Radiation Sources for the (Report of the Association of the British Pharmaceutical Industry), 903
Stern, Dr. Curt : Mechanisms of Meiotic Non-disjunction in Man, 805
Stern, P. A. (Oppenheim, A. K., and) : Combustion and Propulsion—High Mach Number Air-breathing Engines (Applicability of Detonation Wave Studies to Hypersonic Combustion), 21
Sternling, C. V. (Scriven, L. E., and) : The Marangoni Effects, 186
Steroid Chemistry : Recent Advances in (Kingston Technical College Postgraduate Course on), 905
Steroid 11β-ol Dehydrogenase in Human Placenta (Dr. P. A. Osinski), 777
Steroids : Microanalytical Separation of, by Gas Chromatography (C. C. Sweeley and Dr. E. C. Horning), 144
Stevenson, D. E. (Hall, L. W., and) : Effects of Ataractic Drugs on the Blood-Pressure and Heart-Rate of Dogs, 696
Steward, E. G., and others : Dependence on Temperature of the Interlayer Spacing in Carbons of Different Graphitic Perfection, 1015
Steward, F. C. : Plant Physiology, Vol. 2, Plants in relation to Water and Solutes, *review* by Prof. Walter Stiles, 889
Stewardson, Prof. E. A. : Grant of £13,006 for Space Research (for investigations of solar and stellar soft X-Ray emissions), 744
Stewart, C. M., and Higgins, H. G. : Carbohydrates of *Ecklonia radiata*, 511
Stewart, C. P. (edited by Harry Sobotka, and) : Advances in Clinical Chemistry, Vol. 2, *review* by Dr. R. Consden, 890
Stewart, Doreen L. (Brown, F., and) : Infective Ribonucleic Acid from the Viruses of Talfan and Teschen Diseases, 714
Stewart, John S. S. : Mechanisms of Meiotic Non-disjunction in Man, 804
Steyn, J. (Peisach, Dr. M., and) : Radiolytic Oxidation of Ferrous Solutions with Standardized Internal Sources of Phosphorus-32, 58
Stilboestrol applied to the Wheat Seedling : Plant Hormone Activity—(Dr. J. J. C. Hinton and Dr. T. Moran), 258
Stiles, Prof. Walter : Aspects of Plant Nutrition, *review*, 815
  A New Treatise on Plant Physiology, *review*, 889
Stimulated Optical Radiation in Ruby (Dr. T. H. Maiman), 493
Stimulus (Physiological) : Summative Action of Acetylcholine with, on the Generator Potential in the Lateral Eye of the Horseshoe Crab (R. Kikuchi, K. Naito and S. Minagawa), 1118
Stobo, I. J. F. : Awarded a Wellcome Fellowship by the Animal Health Trust, 904
Stochastic Path Integrals : A Remark on (Prof. M. S. Bartlett), 968
Stockholm Cyclotron : Modernization of the, 381
Stoll, Prof. A. : The Chemistry of Natural Products (Impact of Studies of Natural Products on Chemical Industry), 1080
Stollery, J. L. : History of Engineering Invention, *review*, 8
Stommel, Dr. Henry : The Gulf Stream—a Physical and Dynamical Description, *review* by Dr. G. E. R. Deacon, 183
Stone, N. W. B., and others : Pure Rotational Absorption of Ozone in the Region 125-500 Microns, 765
Stone Age in Northern Africa (Dr. C. B. M. McBurney), *review* by M. C. Burkitt, 1062
Storms (Geomagnetic), and the Space around the Earth (Prof. Sydney Chapman), 824
Storrs, Eleanor E. (Burchfield, Dr. H. P., and) : An Ortho Effect influencing Fungitoxicity, Electronic Absorption Spectra, and Chemical Reactivity with Mercaptalbumin, 593
Story of Chemical Industry in Basle (published by Ciba Limited on the occasion of its 75th Anniversary), *review* by Dr. L. K. Sharp, 540
Strachey, C. : At the second Annual Conference of the British Computer Society (A Common Computer Language), 655
Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture : Production of Lysergic Acid Derivatives by a (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Strain Differences in Acetylcholine Concentration in the Brain of the Rat (Edward L. Bennett, James Crossland, David Krech and Mark R. Rosenzweig), 787
Straining (Tensile) : Behaviour of Paper during (A. E. Ranger and L. F. Hopkins), 1097
Strains of Enteric Bacilli : Effect of the Peritoneal Fluid of the Guinea Pig on (Prof. R. J. Roantree and L. R. Collis), 1045
Strange, R. E. : Glucosamine Values of Muramic Acid and other Amino-Sugars by the Elson and Morgan Method, 38
Straus, Herbert L. : Awarded a United States fellowship by the Ramsay Memorial Fellowship Trustees, 832
Strawberry : Effect of Autumn Applications of Potassium Gibberellate on Fruit Production of the (Prof. Carter R. Smith), 620
Streak (Virus-) Disease of Tomatoes (B. H. MacNeill and Hikmet Ismen), 903
Stream : The Gulf—a Physical and Dynamical Description (Dr. Henry Stommel), *review* by Dr. G. E. R. Deacon, 183
Streaming in Cytoplasm dissociated from the Giant Amoeba, *Chaos chaos* (Prof. R. D. Allen, J. W. Cooledge and P. J. Hall), 896
Street, Sir Kenneth : The Chemistry of Natural Products, 1081
Strength of Solids (Prof. A. H. Cottrell), 659
Strength (Bond-) (Cement-Aggregate) : Dependence of, on Size of Aggregate (K. M. Alexander and J. Wardlaw), 230
Strength (Ionic), of the Medium : Influence of the, on the Anaphylactic Sensitization of Isolated Tissues *in vitro* (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Strengths of Acid-etched Glass Rods (B. A. Proctor), 492
Streptococci (Nephritogenic) : Immunological Relationships between the Rat Glomerulus and (A. S. Markowitz, S. Howard Armstrong, Jun., and Daniel S. Kushner), 1095
Streptococcus pyogenes : Starch-like Polysaccharide of (Dr. H. Baum and Dr. N. Crowley), 413
Streptomyces : An Antibiotic Complex derived from a, and Active against Gram-positive Bacteria (B. Sgarzi, A. M. Lugli and G. Gioiitti), 1029
Streptomycin : Absence of Carbon Monoxide-sensitive Respiration in a Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of (Hanna Engelberg and Dr. M. Artman), 801
Streptomycin-dependent Mutant of *Escherichia coli* grown in Limited Amount of Streptomycin : Absence of Carbon Monoxide-sensitive Respiration in a (Hanna Engelberg and Dr. M. Artman), 801
Streptomycin-resistant Mutants of *Bacillus subtilis* : Appearance of New Deficient Characters in (Masamichi Kohiyama and Yonosuke Ikeda), 168
Stress (Yield), exerted on a Body Immersed in a Bingham Fluid (G. Boardman and Dr. R. L. Whitmore), 50
Stress-Dependent Magnetization in some Quartz-Dolerites (Dr. D. W. Powell), 225
Stress Studies (Psychomotor), with Sub-normal Psychopathic Subjects : Preliminary (Dr. J. E. Tong, I. C. Murphy and F. R. Adams), 172
Stresses (Alternating), required to Initiate and Propagate a Fatigue Crack in Mild Steel : Correlation of the (N. E. Frost), 233
Stretch, R. G. A. : Appointed lecturer in psychology at the Queen's University, Belfast, 465
Striated Muscle : A Hypothesis of Contraction in (Dr. M. Spencer and Dr. C. R. Worthington), 388
Striga : Insects attacking (D. V. Murthy), 959
Stringer, Ivor S. (Schnurmann, Dr. Robert, and) : Initiation of Chemical Reactions by Mechanical Forces, 587
Strmiska, Dr. Jaroslav, and Vacek, Dr. Antonin : Effect of Electronarcosis on Oxygen Consumption and Carbon Dioxide Output, 151

Strontium : Atomic Absorption Spectrophotometric Determination of Molybdenum and (D. J. David), 1109
Strontium (Radioactive and Natural), in Human Bone (J. W. Arden, F. J. Bryant, E. H. Henderson, G. D. Lloyd and A. G. Morton), 994
Strontium-89 and Strontium-90 : The Deposition of, on Agricultural Land and their Entry into Milk after the Reactor Accident at Windscale in October 1957 (United Kingdom Atomic Energy Authority and the Agricultural Research Council joint Report on), 1077
Strontium-90 Compounds in Soil : Relative Availability of some (Dr. R. L. Uhler and Dr. P. P. Hungate), 252
Structural Geology : The Use of Stereographic Projection in (Dr. F. C. Phillips), second edition, *review* by John Sutton, 729
Structure of β-Acylacrylic Acids (Prof. Nils Hellstrom), 146, *erratum*, 650
Structure of the 1:1-Adducts of Cupric β-Diketone Chelates with Heterocyclic Bases (Dr. D. P. Graddon and E. C. Watton), 1021
Structure of the Antibiotics *PA1148-1* and *PA1148-3* (D. C. Hobbs and W. D. Celmer), 598
Structure of $AgSCN.P(n\text{-}C_4H_9)_3$ (Dr. A. Turco, C. Panattoni and E. Frasson), 772
Structure of the Trinuclear Basic Acetates (Dr. L. E. Orgel), 504
Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy (Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives), (C. P. Blakely, Dr R. J. Gillespie, L. Roubinek, Dr. A. Wassermann and R. F. M. White), 662
Structure (Crystal), of 9:10-Dimethyl-1:2-benzanthracene (Dr D. Sayre and Dr P. H. Friedlander), 139
Structure (Crystal) Determination : Modern Methods of (Manchester College of Science and Technology Summer School in), 201
Structure (Crystal-) Investigation : Vector Space and its Application in (Prof. Martin J. Buerger), *review* by Dr. J. W. Jeffery, 975
Structure (Crystal) Models : Bibliography on Molecular and (Deane K. Smith), (United States National Bureau of Standards, Monograph No. 14), 903
Structure (Domain or Turbostratic), of Clays (L. A. G. Aylmore and Dr. J. P. Quirk), 1046
Structure (Hexagonal) : Work-Hardening and Ductility of Rhenium and their relation to the Behaviours of other Metals having a (R. A. Jeffery and E. Smith), 52
Structure (Laminated), of Bones from some Marine Mammals (Dr. R. M. Laws), 338
Structure (Molecular) : The Determination of (P. J. Wheatley), *review* by Dr. J. W. Cook, 812
Structure (Non-Crystalline), in Solidified Gold—Silicon Alloys (W. Klement, jun., R. H. Willens and Prof. Pol Duwez), 869
Structure (Nuclear) : International Conference on, 290
Structure (Social) : Religion and, *review* by Michael Argyle, 96
Structure (Spermathecal), in some Species of *Tribolium* : Taxonomic Significance of (Gordon Surtees), 1138
Structure and Function : Biological (International Union of Biochemistry and the International Union of Biological Sciences Symposium on), 905
Structure, Synthesis and Function of Deoxyribonucleic Acid (Société de Chimie Physique Meeting on), 1079
Structure and Systematic Position of the Australian Brown Alga, *Notheia anomala* (M. Nizamuddin and Dr H. B. S. Womersley), 673
Structures : Valence-Bond—a New Proposal (Dr. J. W. Linnett), 859
Structures of some Acetyl-serine Peptides from Acetyl-chymotrypsin (Leo Benoiton, Prof. H. N. Rydon, R. A. Oosterbaan, M. E. Van Adrichem and Prof. J. A. Cohen), 596
Structures (Auroral) : Theory of (E. R. Harrison), 383
Structures (Coral), and Classification, *review* by Dr. H. Dighton Thomas, 95
Structures (Crystal), of the High-Pressure Forms of Ice—Ice III (Prof. W. Barclay Kamb and Sankar K. Datta), 140
Structures (Layer) : Dislocations in (V. A. Phillips and P. Cannon), 313
Stubblefield, Dr. C. J. : Nomenclature of the Keuper Series, 869
Students entering Training Colleges : Recruits to Teaching—a Study of the Attainments, Qualifications and Attitudes of (F. W. Land), 750
Students (University) : Daily Food Consumption by South African (Sonia E. Walker), 381
Studentship (Mackinnon Research) awarded by the Royal Society to Dr. D. T. Edmonds, 291
Studentship and Scholarship Awards for 1960 (Royal Commission for the Exhibition of 1851), 116
Studentships (Research), for postgraduate training in Ecology (Nature Conservancy Awards for 1960), 742
Studies : Earthworm Population—a Comparison of Sampling Methods (F. Raw), 257
Studies in the History of Education, 1780-1870 (Brian Simon), *review* by Dr. James L. Henderson, 357
Studies in Marine Physics, *review* by Dr. G. E. R. Deacon, 183
Studies (Case) : Research in, 659
  Research Necessary for the Preparation and Use of (South London Committee of the British Institute of Management Conference on), 660
Studies (Cosmic Radiation), in South America, 648
Studies (Immunoelectrophoretic), on Purified Human Growth Hormone (Dr. Jan Hirschfeld, Carl-Axel Gemzell and Leif Wide), 64
Studies (Psychomotor Stress), with Subnormal Psychopathic Subjects : Preliminary (Dr. J. E. Tong, I. C. Murphy and F. R. Adams), 172
Studies (Renal), in Sheep : Use of Diodone in (B. J. Potter), 698
Studies (Sociological), at the University of Sheffield, 463
Studies (Upper-Atmosphere Wind), by *Skylark* Rocket Sodium Experiment (Dr. G. V. Groves), 1001
Study : Scientific Research and Development—a Comparative (S. Dedijer), 458
Study sponsored by the Nuffield Foundation : Principles for British Agricultural Policy—a (edited by H. T. Williams), *review* by Sir John Russell, 721
Study of the Attainments, Qualifications and Attitudes of Students entering Training Colleges : Recruits to Teaching—a (F. W. Land), 750
Study of Development and Growth, Society for the : Seventeenth Symposium—Cell, Organism and Milieu (edited by Prof. Dorothea Rudnick), *review* by Dr. E. N. Willmer, 450
Study of Eighteenth-Century Science : The Transits of Venus—a (Prof. Harry Woolf), *review* by Dr. David S. Evans, 636
Study of the Epidermal Cell in an Insect : The Control of Growth and Form—a (Prof. V. B. Wigglesworth), *review* by Prof. R. Dennell, 631
Study of Man, Research Institute for the (Division of Anthropology of the New York Academy of Sciences and the) : Conference on Culture, Society and Health, 658
Study of Non-Linear Problems, *review* by K. Krickeberg, 727
Study of Psychoanalysis and Medicine : The Wish to Fall Ill—a (Dr Karin Stephen), *review* by Dr Clifford Allen, 978
Study of Sanity and Madness : The Divided Self—a (Dr. R. D. Laing), *review* by Dr. Clifford Allen, 1062
Study in some Trained Manpower Problems : The Public Service in New States—a (Kenneth Younger), 971
Study (A Clinical and Genetico-Statistical), of Schizophrenia and Low-Grade Mental Deficiency in a Large Swedish Rural Population (Bertil Hallgren and Torsten Sjogren), 298
Study (A New), of the British Odonata, *review* by Dr D. E. Kimmins, 631
Study (Potentiometric), of Priming Paints for Metal (Dr. N. R. Bharucha), 756
Studying Tumour Blood Supply using Lissamine Green : A Rapid Method for (L. N. Owen), 795
Sturtevant, Dr F. M. : Electro-shock Seizure Threshold of Metacorticoid Hypertensive Rats, 874
Subjects (Normal and Leukaemic) : Zinc Content of Erythrocytes and Leucocytes of Blood of (E. Dennes, R. Tupper and Prof. A. Wormall), 302
Submarine *Severyanka* : Oceanographic and Fisheries Research by the (V. P. Zaitsev), 559
Submarine Geology, *review* by Dr. G. E. R. Deacon, 629
Submarine Oil Drilling (M. K. Kalinko), 903
Submerged Culture : Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in (F. Arcamone, C. Bonino, Prof. E. B. Chain, A. Ferretti, P. Pennella, A. Tonolo and Lidia Vero), 238
Subnormal Psychopathic Subjects : Preliminary Psychomotor Stress Studies with (Dr. J. E. Tong, I. C. Murphy and F. R. Adams), 172
Substance from Erythocytes of Blood Group A (J. Koscielak and K. Zakrzewska), 516
Substance (Pharmacologically Active) : An Unidentified, extracted from Cerebral Hemispheres (P. F. L. Andrews, Shirley A. P. Price and Dr. G. B. West), 420
Substances in Water : Infra-Red Spectra of Amino-Acids and related (Prof. Frank S. Parker and Prof. Donald M. Kirschenbaum), 386
Sub-Units of Tobacco Mosaic Virus Protein : A Difference between the (Dr H. G. Aach), 75
Successful Biological Control of Insect Pests : Significance of the Type of Host Plant Crop in (D. C. Lloyd), 430
Succinate Oxidation in Uncoupled Rat Liver Mitochondria : A High-Energy Phosphate Requirement for (Dr. Giovanni Felice Azzone and Dr. Lars Ernster), 65
Sucrose : Biosynthesis of, by Preparations from Potatoes stored in the Cold and at Room Temperature (Dr. Sigmund Schwimmer and Edward S. Rorem), 1113
Sucrose in the Rat's Ventricle : Effect of Nitrate Ion on the Distribution of (S. T. Takata, C. G. Alexander and Prof. G. A. Feigen), 419
Suction Traps (Insect) : Vent-Axia, 559
Sudden Discontinuity in the Orbital Period of *Sputnik* 4 Satellite (B. R. May and D. E. Smith), 866
Sugar Analysis, International Commission for Uniform Methods of—Report of the Proceedings of the Twelfth Session, Washington, D.C., 1958, *review* by Prof. E. L. Hirst, 9
Sugar Refining Co. (Colonial) : The David North Plant Research Centre (K. T. Glasson), 745
Sugar Research Laboratory to be established by the Australian Commonwealth Scientific and Industrial Research Organization, 372
Sugar Technology : Principles of (edited by Pieter Honig), Vol. 2, Crystallization, *review* by H. C. S. de Whalley, 979
Sugars : Ferricyanide Reduction Method for Reducing (Dr. Richard I. Mateles), 241
Sugars (Amino-) : Glucosamine Values of Muramic Acid and other, by the Elson and Morgan Method (R. E. Strange), 38
Suggested Effect on Levels of Catecholamine in Brain produced by Small Doses of Reserpine (F. Barbara Orlans and Dr. Bernard B. Brodie), 1034 ; (Herbert Sheppard and Joseph H. Zimmerman), 1035
Sugino, N., and others : Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of Kidney Slices from *Necturus*, 699
Suicide, a Neglected Problem, 207
Sully, Dr. A. H. : The British Steel Castings Research Association—Open Days, 657
Sulphide Films on Steel : Growth of (R. B. Campbell, L. Grunberg and H. M. Scott), 588
Sulphide Phase in some Iron Meteorites (Dr. H. J. Axon), 406
Sulphides : Mass Spectrometric Investigation of the Vaporization of, and the Dissociation Energy of S_2 (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
S_2 : Mass Spectrometric Investigation of the Vaporization of Sulphides and the Dissociation Energy of (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408
Sulphur (Tetra-substituted) : Optically Active Forms of a Derivative of (M. Baresh), 591
Sulphur Bacteria (Green) : A New Species of (V. V. Shaposhnikov, E. N. Kondratieva and V. D. Federov), 167
Summative Action of Acetylcholine with Physiological Stimulus on the Generator Potential in the Lateral Eye of the Horseshoe Crab (R. Kikuchi, K. Naito and S. Minagawa), 1118
Summer Course (International), on Solid State Physics (Società Italiana di Fisica), 201
Summer School in Modern Methods of Crystal Structure Determination (Manchester College of Science and Technology), 201
Summer School (Non-residential), on Numerical Analysis (Delegacy for Extra-Mural Studies, University of Oxford), 374
Summers, Roger : Environment and Culture in Southern Rhodesia, 993
Superconducting-Normal Transition in Tin Films : Speed of the (D. J. Oliver, M. J. Rayner and E. H. Rhoderick), 492
Super-Exchange (Covalent), in Solid State Physics (Prof. W. S. Fyfe and Prof. J. Verhoogen), 1108

Supervision (Direction and), of Scientific and Engineering Personnel (Northampton College of Advanced Technology, London, Advanced Course on), 905
Support for Under-developed Countries, 971
Suppression of Cytoplasmic Division in *Amoeba proteus* (Dr. Edmund Guttes and Sophie Guttes), 520
Surface Contamination formed in Demountable Vacuum Systems : Direct Observation of (D. E. Bradley), 227
Surface Density of Charge : Effect of, on the Physical Swelling of Lithium Montmorillonite (Dr J. P. Quirk and B. K. G. Theng), 967
Surface Sea Water off the California Coast (1959-60) : Fall-out Caesium in, by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J. Mohanrao and Perrin Winchell), 480
Surface-active Agents : Treatment of *Leishmania donovani* Infections with (Dr. J. D. Fulton), 1129
Surface-active Compounds : Action of some, on the Gastro-intestinal Mucosa (Dr. J. A. Nissim), 305
Surfaces (Metal) : Simultaneous Measurement of Adsorption and Electrode-kinetic Parameters at (A. M. Peers), 503 ; (Dr. E. A. Blomgren and Dr. J. O'M. Bockris), 504
Surgeons of England, Royal College of : New Laboratory Building, 118
Surgeons of England, Royal College of, and others : First British Congress on the History of Medicine and Pharmacy, 374
Surtees, Gordon : Taxonomic Significance of Spermathecal Structure in some Species of *Tribolium*, 1138
Survival of Woody Plants at Extremely Low Temperatures (Johnson Parker), 1133 ; (Dr. Akira Sakai), 1134
Sustained Action of Injected Chelating Agents (Dr. A. Lindenbaum and Dr. J. Schubert), 575
Sutcliffe, D. W. : Osmotic Regulation in the Larvae of some Euryhaline Diptera, 331
Sutherland, Dr. I. O. : Appointed lecturer in organic chemistry at the University of Bristol, 465
Sutherland, Prof. Robert L. : Engineering Systems Analysis, *review* by Prof. J. Greig, 359
Suto, Mitsumasa, and others : Silkworm Raising on Artificial Food, 669
Sutton, Sir Graham (edited by) : The World Around Us, *review* by G. R. Noakes, 975
Sutton, John : The Use of Stereographic Projection in Structural Geology, *review*, 729
Suzuki, Keoshi, and Iwama, Yukiko : Recovery in the Presence of Chloramphenicol of *Escherichia coli* B (H) Irradiated with Ultra-violet Light, 347
Suzuki, Takeo, and others : Xylan of Siphonaceous Green Algae, 82
Svestka, Z., and others : Measurement of Magnetic Fields in Chromospheric Flares, 224
Swain, A., and others : Recapture in the River Tweed of a Sea-Trout marked in Devonshire, 877
Swamps (Papyrus) : Experimental Breeding of *Anopheles gambiae* Giles in (L. K. H. Goma), 1137
Swan, Dr. P. : Distorted Wave Approximation for Scattering Phase-Shifts, 585
Swedish Academy of Engineering Sciences (Royal), and the Swedish Association of Technical Physicists : Fifth International Instruments and Measurements Conference and Exhibition, 374
Swedish Association of Technical Physicists (Royal Swedish Academy of Engineering Sciences and the) : Fifth International Instruments and Measurements Conference and Exhibition, 374
Swedish National Committee for Physics : Tenth General Physics Conference, 557
Swedish Rural Population : A Clinical and Genetico-Statistical Study of Schizophrenia and Low-Grade Mental Deficiency in a Large (Bertil Hallgren and Torsten Sjogren), 298
Swedish Soils : Content of Caesium-137 and (Zirconium+Niobium)-95 in (Kerstin Löw and K. Edvarson), 736
Swedish Supplement to Elsevier's Dictionary of Electronics and Waveguides (W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1059
Sweeley, C. C., and Horning, Dr. E. C. : Microanalytical Separation of Steroids by Gas Chromatography, 144
Swelling (Macroscopic), of Vermiculite Crystals in Water (G. F. Walker), 312
Swelling (Physical), of Lithium Montmorillonite : Effect of Surface Density of Charge on the (Dr. J. P. Quirk and B. K. G. Theng), 967
Swift, D. R. : An Improved Feed for Experimental Fish, 1133
Swinbank, Dr. P. : Appointed a lecturer in physics in the University of Birmingham, 465
Swinburne Medal of the Plastics Institute awarded to Prof. G. Gee, 740
Swinnerton, Prof. H. H. : Fossils, *review* by Prof. S. Simpson, 271
Swinton, Dr. W. E. : Presidential Address at the sixty-sixth Annual Conference of the Museums Association, 657
Sykes, G. : Elected president of the Society for Applied Bacteriology, 904
Sykes, J. (Dagley, Dr. S., and) : Cytoplasmic Particles and their Role in Protein Synthesis (One Effect of Chloramphenicol on Micro-organisms is to inhibit Protein Synthesis), 644
Symbolic Logic and its Applications : Introduction to (Rudolf Carnap), translated by William H. Meyer and John Wilkinson, *review* by F. I. G. Rawlins, 729
Symes, R J. : Évacuation et Récupération de la Chaleur des Réacteurs Nucléaires, *review*, 636
Symmetrical ? : Are the Laws of Nature (Prof. O. R. Frisch), 638
Symmetrical Fourfold Helical Fracture in Titanium Oxide (J. S. Jackson), 1104
Symons, Dr. M. C. R. : Appointed to the new chair of physical chemistry in the University of Leicester, 743
Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), *erratum*, 559
Synergism of Bivalent Metal Ions in Transphosphorylation (Dr. John M. Lowenstein), 570
Syntheses of Glucose, Cellobiose and other Saccharides by *Acetobacter acetigenum* in a Lactate-buffered Glycerol Medium (Dr. C. P. Jackson and K. Ramamurti), 942
Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates : Oxidative Phosphorylation— (Dr. V. M. Clark, D. W. Hutchinson and Sir Alexander Todd), 59
Synthesis of Cyclic Ethers : A New Method for the (L. F. Schmoyer and L. C. Case), 592
Synthesis of Deoxyribonucleic Acid in Mouse Ascites Cells : Uptake of Thymidine and (Dr. A. R. Crathorn and Dr. K. V. Shooter), 614
Synthesis of Diphosphopyridine Nucleotide in Irradiated Rats (Dr. D. K. Myers), 1124
Synthesis (Enzymatic), of Formylglutamic Acid by a Plant Protein (Ernest H. Byers, jun., and T. J. Bond), 416
Synthesis (Homogeneous), of Isotactic Polystyrene using *n*-Butyllithium Initiator (Dr. R. J. Kern), 410
Synthesis (Laboratory) : Aluminium Interlayers in Clay Minerals, Montmorillonite and Vermiculite— (B. L. Sawhney), 261
Synthesis (Microbial), of Protein in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the Test Organism (Maharani Chakravorty), 239
Synthesis (Optimal Protein), by Ascites Tumour Cells *in vitro* (Dr. M. J. Fraser), 1114
Synthesis (Protein) : Cytoplasmic Particles and their Role in (Colloid and Biophysics Committee of the Faraday Society Informal Discussion on), 643
Synthesis (Pterin), in the Amphibian Neural Crest Cell (Tadeo Hama and Masataka Obika), 326
Synthesis and Biological Properties of L-Arginyl-L-Prolyl-L-Prolyl-Glycyl-L-Phenylalanyl-L-Seryl-L-Phenylalanyl-L-Arginine, an Octapeptide related to Bradykinin (E. D. Nicolaides, H. A. DeWald, Patricia G. Shorley and Dr. H. O. J. Collier), 773
Synthesis and Function of Deoxyribonucleic Acid : Structure, (Société de Chimie Physique Meeting on), 1079
Syrian Hamster : Occurrence of a Brown Mutation in the (Roy Robinson), 170
System : The Silicon–Boron (Prof. Cyrill Brosset and Bengt Magnusson), 54
System (Cambrian) : Age of the (Prof. C. F. Davidson), 1020
System (The Decimal), in Britain, 30
System (Metric) : Decimal Coinage and the—Should Britain Change ? (A joint Report of Committees appointed by the British Association for the Advancement of Science and the Association of British Chambers of Commerce), 30
System (Neurosecretory Hypothalamic) : Antigonadotropic Function of the Pineal Gland and the Oxytocin of the (Prof. S.-M. Milcou and S. Pavel), 950
System (Pituitary Portal), in Elasmobranchs : Presence of a (Patrick Meurling), 336
System (Reticulo-Endothelial) : Depressing Activity of Meprobamate on the (Prof. A. Del Vecchio and L. Bolis), 513
  Effect of some Aromatic Hydroxy Compounds on the Phagocytic Activity of the (Prof. T. Nicol, C. Druce and C. C. Ware), 422
  Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the (Prof. T. Nicol, G. Brownlee, C. Druce and C. C. Ware), 1032
System (Solar) : The Exploration of the (Felix Godwin), *review* by D. G. King-Hele, 811
  Origin of the (Dr. M. M. Woolfson), 47 ; (M. H. Briggs), 1102
System (A Vacuolar), in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of Ultra-thin Sections (Miguel Rubio-Huertos and Paul R. Desjardins), 1043
Systema Helminthum (Prof. Satyu Yamaguti), Vol. 2, The Cestodes of Vertebrates, *review* by Dr. Ben Dawes, 723
Systematic Position of the Australian Brown Alga, *Notheia anomala* : Structure and (M. Nizamuddin and Dr. H. B. S. Womersley), 673
Systematics (Microbial) : Discussion on, 190
Systems : Aspheric Imaging (Dr. C. R. Burch), 854
Systems (Interference), in Virus-infected Plants : Possible Occurrence of (A. D. Thomson), 761
Systems (Liquid) : Equations for Determining Diffusion Coefficients in, by the Diaphragm-Cell Technique (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Systems (Mixed Solvent) : Activity of Bovine Pancreatic Ribonuclease A in (Dorothy Findlay, Dr. A. P. Mathias and Dr. B. R. Rabin), 601
Systems (Non-Static) : Astrophysics of, *review* by Prof. W. H. McCrea, 538
Systems (Pastoral), in relation to World Food Supplies (Dr. William Davies), 849
Systems (Plant Growth) : Ethionine and (R. L. Lowther and W. G. Boll), 832
Systems Analysis : Engineering (Prof. Robert L. Sutherland), *review* by Prof. J. Greig, 359
Systems (Demountable Vacuum) : Direct Observation of Surface Contamination formed in (D. E. Bradley), 227
Systems (Living) : Self-Regulation in (Ottawa Symposium on), 3, Tremor, 297
Szabó, J. L. J., and others : Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia, *erratum*, 559
Szaley, K., and others : Damage to Liver induced by DL-Methionine-Ethylester, 421
Székely, Dr. J., and others : Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152

TABLES of Constants and Numerical Data, Vol. 11, Selected Constants—Optical Rotatory Power, 4, Alkaloids (Prof. J.-P. Mathieu and Prof. M.-M. Janot), *review* by Dr. J. Walker, 7
Tabor, Dr. (Golding, E. W., and) : Problems of the Arid Zones (Local Energy Sources), 295
Tait, Dr. P. J. T. : General fellowship renewed by the Ramsay Memorial Fellowship Trustees, 832
Takahashi, Tamon, and others : Electrophoretic Separation of certain *in vitro* and *in vivo* Reactions of Rabbit Anti-Mouse Erythrocyte Serum, 157
Takashima, Dr. Shiro : Ultra-violet Absorption Spectra of Proteins in Deuterium Oxide, 597
Taketa, S. T., and others . Effect of Nitrate Ion on the Distribution of Sucrose in the Rat's Ventricle, 419
Talfan and Teschen Diseases : Infective Ribonucleic Acid from the Viruses of (F. Brown and Doreen L. Stewart), 714
Tanaka, Katuhide, and Nakajo, Prof. Seichi : Oxytocin in the Neurohypophysis of the Laying Hen, 245

Tang, C. E. Spaans-v d (Clarenburg, Dr. L. A., and) : Small-Scale Turbulent Diffusion in the Atmosphere, 586
Tannages : Types of (The Chemistry and Technology of Leather, edited by Fred O'Flaherty, William T. Roddy and Robert M Lollar, Vol. 2), *review* by Prof A. G. Ward, 724
Tanner, Dr. J. A : Self-Regulation in Living Systems (Tremor—Measuring the Impedance of the Wrist and Finger Extremities when subjected to Sinusoidal or Stochastic Vibrations), 298
Tantalum and Niobium (Dr. G L. Miller), *review* by Prof. A. G. Quarrell, 725
Tartaric Acid (Total and *l*(+)), Inhibited Rat Serum Acid Phosphatase (Dr. Z. Laron and B. Epstein Halberstadt), 67
Tartronic Acid Inhibition of Aerobic Glycolysis in Yoshida Ascites Hepatoma by (Dr. L. Fiume), 792
Tashkent : Botanical Garden in (F. N. Rusanov), 902
Taste Preference in the Monkey : Effects of Medial Temporal Lesions on (Dr. L. Weiskrantz), 879
'Tasters' and 'Non-Tasters' of 6-*n*-Propylthiouracil : Differential Reactivity of Saliva from (Frances Griffin and Prof Roland Fischer), 417
Tata, Dr. J. R. : Transiodination of Proteins during Enzymic De-iodination of Thyroxine, 1025
Taxonomic Significance of Spermathecal Structure in some Species of *Tribolium* (Gordon Surtees), 1138
Taylor, Dr. A C : Freezing and Drying of Biological Materials, 749
Taylor, Dr. Angela E. R. Awarded a Wellcome Research Fellowship, to enable her to undertake research on the metabolic requirements of helminths, using radioactive tracers, in the Department of Biology at Queen Elizabeth College, London, 201
Taylor, Charles R. (Hudson, Jack W., and) : Variability in Levels of Blood Uric Acid in Five Species of Birds, 788
Taylor, Dr. D. M (Sowby, Dr F. D., and) . Removal of Internally Deposited Americium by Chelating Agents, 612
Taylor, E. Windle . Metropolitan Water Board—Thirty-eighth Report on the Results of the Bacteriological, Chemical and Biological Examination of the London Waters for the Years 1957-1958, 468
Taylor, Dr. James : Chemistry is Not Enough (Presidential Address to Section B (Chemistry) of the British Association for the Advancement of Science), 841
Taylor, Dr. J. D., and others : New Inhibitor of Monoamine Oxidase, 941
Taylor, M. D. : Awarded a CJB Scholarship, 650
Taylor, R. B : Awarded a Wellcome Fellowship by the Animal Health Trust, 904
Taylor, Dr. Richard M., and Winbury, Martin M. . A Potent New Benzothiadiazine Diuretic, 603
Taylor, Prof S. A. (Slatyer, Dr. R. O., and) : Terminology in Plant- and Soil- Water Relations, 922
Taylor, Dr. S. R., and others : Major Element Relationships in Tektites, 680
Taylor, Dr. T. G , and Hertelendy, F. · Parallel Distribution of Calcium and Citric Acid in the Oviduct of the Hen, 244
Teachers Bill : Commonwealth (Second reading in the House of Commons), 441
Teachers for Health Education : Training of (United Nations, World Health Organization, Technical Report Series No 193), 648
Teaching · Recruits to—a Study of the Attainments, Qualifications and Attitudes of Students entering Training Colleges (F. W. Land), 750
Teaching (Laboratory-) of Languages (Arthur D. Little, Inc., Industrial Bulletin No 373), 568
Teaching (Science), in Secondary Modern Schools (Science Masters' Association Survey on), 206
Teale, Dr F. W. J. Appointed a lecturer in biochemistry at the University of Birmingham, 117
Tebble, N : Pelagic Polychaetes of the South Atlantic, 289
Technical Books . Recent Scientific and, Supp vi, July 30 ; Supp iv, August 27 , Supp. vi, September 24
Technical Books and Dictionaries (Japanese Scientific and) . A collection of, presented to the Science Museum Library, London, on behalf of the Prime Minister of Japan, Nobusuke Kishi, 201
Technical College (Kingston) : Postgraduate Course on Recent Advances in Steroid Chemistry, 905
Technical Physicists, Swedish Association of (Royal Swedish Academy of Engineering Sciences and the) Fifth International Instruments and Measurements Conference and Exhibition, 374
Technical Possibilities of a Thames Flood Barrier, 294
Technical Reports (Scientific and) : Indexes for (ASLIB Survey on), 372
Technical Publications (Indian Scientific and) : Bibliography of (Council of Scientific and Industrial Research, New Delhi), 199
Technical and Vocational Education in the U S.A.—a Bibliographical Survey prepared by the United States Office of Education (Unesco, Educational Studies and Documents No. 36), 741
Technique (Diaphragm-Cell) . Equations for Determining Diffusion Coefficients in Liquid Systems by the (F. A. L. Dullien and Prof. L. W. Shemilt), 767
Technique (A New), for Following Rapid Rates of Crystallization (J. H. Magill), 770
Technique (The Ouchterlony), using Antigen or Antiserum labelled with Iodine-131 (Joan M. Rhodes), 793
Techniques (Computer) : Application of, to Nuclear Physics Instruments (G. G. Scarrott), 854
Techniques (Spin Resonance) : Diamagnetic Moment of Gaseous Plasmas measured by (T. C. Marshall, R. A. Kawcyn and Prof L. Goldstein), 584
Technological Awards, National Council for . Report for 1959-1960, 286
Technological Progress (Man's), from Steam Engine to Satellite : Science as History—the Story of (Heinz Gartmann), translated from the German by Alan G. Readett, *review* by J L. Stollery, 8
Technologist in Administration : Scientist and, 353
Technology : High-Pressure, *review* by Dr K. E. Bett, 541
  Interactions of Science and, with Society, 1
  Management and, 537
  Rubber, *review* by Dr. W. F. Watson, 359
  Space (edited by Prof Howard S. Seifert), *review*, 884
Technology, Illinois Institute of : International Symposium on Photoelasticity, 650
Technology, Massachusetts Institute of : Seminar Lectures on the Physiological Role of Fast Transfer Reactions, 904
Technology of Leather : The Chemistry and (edited by Fred O'Flaherty, William T. Roddy and Robert M. Lollar), Vol. 2, Types of Tannages, *review* by Prof A. G. Ward, 724
Technology of Plastics Processing (Association for the Advancement of the Knowledge of Materials, the Royal Institute of Engineers, the Royal Netherlands Chemical Federation and the International Union of Pure and Applied Chemistry International Congress on the), 559
Technology (Advanced), Northampton College of (London) : Advanced Course on Direction and Supervision of Scientific and Engineering Personnel, 905
Technology (Chemical), at Edinburgh, 555
Technology (Food Science and) : International Congress of, 905
Technology (Nuclear Reactor) : Analytical Chemistry in (Oak Ridge National Laboratory Conference on), 994
Technology (Plastics) : Training Grants for (Plastics Institute), 28
Technology (Rubber) : Introduction to (edited by Maurice Morton), *review* by Dr. W. F. Watson, 359
Technology (Science and), in Africa South of the Sahara, 198
Technology (Science and), Manchester College of : Summer School in Modern Methods of Crystal Structure Determination, 201
  Course of lectures on Problems of Radioactivity at Water and Sewage Works, 743
Technology (Science and) : National Lending Library for, 992
Technology (Science and), Royal College of (Glasgow) : Annual Report (1958-59), 115
Technology (Sugar) : Principles of (edited by Pieter Honig), Vol. 2, Crystallization, *review* by H. C. S. de Whalley, 979
Tectonics of the Gobi Mountains (V P Solonenko and N A. Florensov), 373
Teeth of Primates : The Jaws and (W. Warwick James), *review* by Sir Wilfrid Le Gros Clark, 891
Tektites : Major Element Relationships in (R. D. Cherry, Dr. S. R. Taylor and Maureen Sachs), 680
  Origin of (Prof. H. C. Urey), 855
Tektites and Glasses formed by Fusion of Terrestrial Rocks . Comparison of the Chemical Composition and Magnetic Properties of (Dr. Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Tektites, and Petrogenesis : Average Composition of Granites, the Genesis of (Prof E. H. Timothy Whitten), 867
Telecommunication Dictionary (Elsevier's), in Six Languages—English/American, French, Spanish, Italian, German, Dutch (compiled and arranged on an English alphabetical base by A. Visser), *review* by Dr. R L. Smith-Rose, 1059
Telecommunications (Space) : Radio Frequency Control in (Edward Wenk, Jun.), 373
Television : Science Broadcasting in Sound and (A B. Oldfield Davies), 850
Television Engineering (S. W. Amos and D C Birkinshaw), Vol. 1, Fundamentals, Camera Tubes, Television Optics, Electron Optics (written in collaboration with J. L. Bliss) ; Vol 2, Video-Frequency Amplification ; Vol 3, Wave-form Generation ; Vol. 4, General Circuit Techniques, *review* by Dr. R. L. Smith-Rose, 358
  Principles and Practice of, *review* by Dr. R. L. Smith-Rose, 358
Television Field Trials of 405-Line and 625-Line Systems in the UHF and VHF Bands, 1957-1958 (British Broadcasting Corporation), 288
'Telex' : Directory of Libraries in the United Kingdom with access to (Library Association), 558
Temperate Zone Sporadic *E* and the Earth's Magnetic Field : Longitude Effect in (L. H. Heisler and Dr. J D. Whitehead), 676
Temperature : Dependence on, of the Electrical Resistivity of Thermosetting Polymers (R. W. Warfield and M. C. Petree), 316
  Dependence on, of the Interlayer Spacing in Carbons of Different Graphitic Perfection (E. G. Steward, B P. Cook and E. A. Kellett), 1015
  Effect of, on the Expansion on Setting of Gypsum Plaster (P. J. Sereda), 929
  Effect of Variations in, on Meiosis in *Gagea reticulata* Schultes (Dr C. P. Malik), 805
  The Helium-4 Scale of (F. C. Brickwedde, H. van Dijk, M. Durieux, J. R. Clement and J. K. Logan), 1077
Temperature of Formation of Antarctic Snows : Isotopic Composition and (Prof. E Picciotto, X de Maere and Dr I. Friedman), 857
Temperature (Frost-point), and Wind : Airborne Measurements of Latitudinal Variation of (N. C. Helliwell), 993
Temperature (High-) Furnaces (A Gallenkamp and Co., Ltd., Catalogue No. 620), 1077
Temperature (High-) Resistance and Thermal Degradation of Polymers (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 466
Temperature (Low) . The Second Virial Coefficient of Methane at (G. Thomaes and R. Van Steenwinkel), 229
Temperature (Low-) Fuel Cell (Shell Research Centre), 994
Temperature (Room) : Biosynthesis of Sucrose by Preparations from Potatoes stored in the Cold and at (Dr. Sigmund Schwimmer and Edward S Rorem), 1113
Temperature (Shrinkage), of Collagen : Hydroxyproline and the (B. J. Rigby and Dr. J. D. Spikes), 150
Temperatures reached in Electrical Discharges in the Solar Atmosphere (Dr. C. E. R. Bruce), 865
Temperatures (Extremely Low) : Survival of Woody Plants at (Johnson Parker), 1133 , (Dr. Akira Sakai), 1134
Temperatures (High) : An Improvement in the Ductility of Beryllium at (A. Brown, F. Morrow and A. J. Martin), 494
Temperatures (Low) · Thermal Expansion at (Guy K. White), 927
Tempering of Martensite . Retained Austenite and the (S. Matas and Prof. R. P. Hehemann), 685
Temporal Lesions (Medial) : Effects of, on Taste Preference in the Monkey (Dr L Weiskrantz), 879
Tensile Straining : Behaviour of Paper during (A. E. Ranger and L. F. Hopkins), 1097
Tension of Vascular Muscle : Effect of the Cations of the Lyotropic Series on the (Prof. L. Laszt), 329
Teodorczuk, Dr. H (Zoutendyk, Dr. A., and) : The Rh Factor C in South African Bantu, 790
Terayama, Prof. H , and others · Distribution of Protein-bound Aminoazo Dyes in the Rat Liver Microsome, 943

Term Placental (Human,) 17β-Œstradiol Dehydrogenases : Histochemical Localization of—Implications for the Transhydrogenase Reaction (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
N-Terminal Amino-Acids of Bovine Antibody (Elizabeth M. Press and R. R. Porter), 59
Terminal Inflorescence in the Genus *Trifolium* : Axial Origin of the (Yvonne Aitken), 622
Terminology in Plant- and Soil- Water Relations (Dr. R. O. Slatyer and Prof. S. A. Taylor), 922
Terpene Hydrocarbons : Radiolysis of—Isomerization and Polymerization of α- and β-Pinene (T. H. Bates and Dr. T. Ffrancon Williams), 665
Terpenes : Microbiological Transformation of—Hydroxylation of α-Pinene (P. K. Bhattacharyya, B. R. Prema, B. D. Kulkarni and S. K. Pradhan), 609
Terrestrial Rocks : Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of (Dr Irving Friedman, Dr. Arthur Thorpe and Dr. Frank E. Senftle), 1089
Terrington and Kirton Experimental Husbandry Farms, King's Lynn : Appointment of F. E. Shotton as director, 905
Territories . British Colonial, 906
Territories, 1959-1960 : The Colonial, 906
Terroune, Prof. E F. : Elected an honorary member of the American Institute of Nutrition, 374
Teschen Diseases (Talfan and) : Infective Ribonucleic Acid from the Viruses of (F. Brown and Doreen L. Stewart), 714
Test (The Anti-Globulin (Coombs)), in Laboratory Practice (Dr. I. Dunsford and Jean Grant), *review* by Dr. R Drummond, 357
Test Organism : Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids with *Azotobacter vinelandii* as the (Maharani Chakravorty), 239
Testicular Hyaluronidase : Effect of, on the Permeability of Human Arterial Tissue (Jørgen Matzke), 873
Testing (Laboratory), in Soil Engineering (T. N. W. Akroyd), *review* by Dr. H. L. Penman, 891
Testing (Non-Destructive), of Materials (British Council Course on), 1079
Testis Lipids in the Common Frog, *Rana temporaria* . Cyclical Changes in the Distribution of the (Dr B. Lofts and C. Boswell), 708
Tests (Potassium Tolerance), in South Indian People (Dr G. Henrotte, G Krishnamurthi and G. Ranganathan), 328
Tetanus : pH Changes during Muscle Twitch and (A. Distèche), 1119
  Vaccination against Whooping Cough, Diphtheria and (Research Defence Society, *Conquest* Pamphlet No. 11), 649
Tetra-substituted Sulphur : Optically Active Forms of a Derivative of (M. Baresh), 591
Tetrahydro-1,3-oxazine Derivatives : Anti-neoplastic Activity of (Prof. T. Urbański, D. Gürne, S. Slopek, H. Mordarska and M. Mordarski), 426
Tetrakis (Hydroxymethyl) Phosphonium Chloride Action of, on Wool (L. S. Bajpai, Prof. C. S. Whewell and J. M. Woodhouse), 602
Tetraploids (Colchicine-induced), of *Annona squamosa* L. : Unproductivity in the (Prof Ahmad Shamsul Islam), 343
Textile Encyclopedia : Man-Made (edited by J. J. Press), *review* by Prof. C. S. Whewell, 2
Textile Institute : Warner Memorial Medal awarded to Prof. C. S. Whewell, 201
Thames Flood Barrier : Technical Possibilities of a, 294
Theng, B. K. G. (Quirk, Dr. J. P., and) : Effect of Surface Density of Charge on the Physical Swelling of Lithium Montmorillonite, 967
Theorem (Reciprocal), and Theory of Statically Indeterminate Frameworks : A Historical Note on the (T. M. Charlton), 231
Theoretical Physics : Reference Book of, *review* by Prof. R. Eisenschitz, 445
Theories of Figures of Celestial Bodies (Wenceslas S. Jardetzky), *review* by Prof. L. S. Goddard, 890
Theory of Atomic Nuclei (Publication by the Physical Society of Japan of a volume of papers on), 743
Theory of Auroral Structures (E. R. Harrison), 383
Theory of Heredity : Chromosomes and the (Prof. C. D. Darlington), 892
Theory of High Explosives, *review* by Dr. W. L. Murray, 539
Theory of the Ionosphere : Recent Trends in the (J. A. Ratcliffe), 853
Theory of Optimal Games (Prof. Alan S. C. Ross), 968
Theory of Relativity (W. Pauli), translated from the German by G. Field, *review* by Dr. D. W. Sciama, 4
Theory of Sound Transmission with Application to the Ocean : Introduction to the (Prof. C. B. Officer), *review* by Dr A. B. Wood, 539
Theory of Space, Time and Gravitation (V. Fock), translated from the Russian by N. Kemmer, *review* by Dr. D. W. Sciama, 4
Theory of Statically Indeterminate Frameworks : A Historical Note on the Reciprocal Theorem and (T. M. Charlton), 231
Theory (Circuit) : General (Prof. Gordon Newstead), *review* by Prof. A. H. M. Arnold, 811
  General and Linear, *review* by Prof. A. H. M. Arnold, 811
Theory (Evolutionary), after Mendel, *review* by Dr. H Kalmus, 726
Theory (Evolutionary), and Christian Belief : The Conflict between (Dr. David Lack), 98
Theory (The Magneto-Ionic), and its Applications to the Ionosphere (J. A. Ratcliffe), *review* by Sir Harrie Massey, 810
Theory (Random) : Nonlinear Problems in (Prof. Norbert Wiener), *review* by K. Krickeberg, 727
Theory and Practice : Ferrimagnetism in, *review* by Dr. G. E. Bacon, 974
Therapy (Antibiotic), and Staphylococcal Diseases (edited by Dr. Henry Welch and Prof. Maxwell Finland), *review* by Prof. R. Knox, 637
Thermal Analysis (Differential), of some Transition Metal Ethylenediamine Tetraacetic Acid Chelates (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Thermal Conduction in Mica along the Planes of Cleavage (H. J. Goldsmid and A. E. Bowley), 864
Thermal Degradation of Polymers : High-Temperature Resistance and (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 466
Thermal Expansion at Low Temperatures (Guy K. White), 927
Thermal Insulation : Domestic Heating and (Building Research Station, Digest 133), 999
Thermal Neutrons : Localization by Autoradiography at -195° C. of Radioactive Areas in Rats exposed to a High Flux of—Importance of Phosphorus-32 in Consecutive Internal Irradiation (Jean Chanteur and Pierre Pellerin), 472
Thermochemistry in Molten Salts : 'Enthalpy Titrations' and (Prof. Joseph Jordan, Jurg Meier, Edward J. Billingham, jun., and James Pendergrast), 318
Thermosetting Polymers : Dependence on Temperature of the Electrical Resistivity of (R. W. Warfield and M. C. Petree), 316
Thickening (Artificial), of Bone and the Piltdown Skull (Prof. Ashley Montagu), 174 ; (Dr. Kenneth P. Oakley), 174
Thimann, Prof. Kenneth V. (Sorokin, Helen P., and) : Plastids of the *Avena* Coleoptile, 1038
Thin (Ultra-) Sections : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of (Miguel Rubio-Huertos and Paul R. Desjardins), 1043
Thin (Ultra-) Sections of Vitrinite from a High-volatile Bituminous Coal : Absorption of Ultra-violet and Visible Light by (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Thiouracils : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thiourea or (A. Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P. C. R. Turner), 691 ; *erratum*, 1079
Thiourea or Thiouracils : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to (A Dimitriadou, Prof. T. Russell Fraser, Dr. J. D. H. Slater and P C. R. Turner), 691 ; *erratum*, 1079
Thomaes, G., and Van Steenwinkel, R. : The Second Virial Coefficient of Methane at Low Temperature, 229
Thomas, D. Brynmor, and others : Pattern of Haemopoiesis in the Foetal Liver, 876
Thomas, Dr. H. Dighton : Coral Structures and Classification, *review*, 95
Thomas, Prof. J. A., and McNicol, Dr. R. W. E. : A Highly Directive Rotating Array for 16 Mc./s., 398
Thompson, Prof. F. C. : Precipitation Processes in Steels—Report of a Conference held in the University of Sheffield, 1958, *review*, 9
  Flat Rolled Products, *review*, 273
Thompson, Dr H. W. : The Chemistry of Natural Products (Physico-Chemical Methods of Studying Natural Products), 1080
Thompson, J. A. : Inhibition of Nodule Bacteria by an Antibiotic from Legume Seed Coats, 619
Thomson, A. D. : Possible Occurrence of Interference Systems in Virus-infected Plants, 761
Thomson, Dr. C. G. : Appointed lecturer in clinical chemistry at the University of Edinburgh, 465
Thomson, D. H., and others : Chemical Effects of Ionizing Radiations on Nucleic Acids and Nucleoproteins, 319
Thomson, Sir George : The Two Aspects of Science (Presidential Address to the British Association for the Advancement of Science), 837
Thomson, Sir Landsborough : The Serengeti National Park, 174
Thomson, T. R., and others : Formation of Fayalite in Roast Reduced Jaspilite, 683
Thorium, Plutonium, Neptunium (Uranium,) : Crystal Chemistry of Simple Compounds of (E. S. Makarov), translated from the Russian by E. B Uvarov, *review* by Dr. L. E. J. Roberts, 728
Thorium and Uranium in the Periodic Table : Positions of (Dr. A. E. Dwight), 505
'Thorotrast' in Tissue Sections : Combined Oil-immersion, Phase-contrast and Dark-ground Viewing of (Dr. E. W Baxter), 162
Thorpe, Dr. Arthur, and others : Comparison of the Chemical Composition and Magnetic Properties of Tektites and Glasses formed by Fusion of Terrestrial Rocks, 1089
Thorpe, Dr. W. V. : Title of professor of physiological chemistry in the University of Birmingham conferred on, 465
Thought (Monetary), and Monetary Policy in England (Prof. R. S. Sayers), 844
Thread-like Apparatus in the Petiole of *Mimosa pudica* : Behaviour of a (Dr. Hideo Toriyama), 709
Threshold (Electro-shock Seizure), of Metacorticoid Hypertensive Rats (Dr. F. M. Sturtevant), 874
Thrombokinase (Blood) · Chromatography of, on 'DEAE'-Cellulose (Dr. J H. Milstone), 1127
Thrombosis and Atherosclerosis : Connective Tissue,—Proceedings of a Conference held at Princeton, N J., 1958 (edited by Irvine H. Page), *review* by Dr. G. S. Boyd, 634
Thrush, Dr. B. A. : The Exploding Wire Phenomenon, *review*, 726
Thymectomized Mice : Recovery of Leukaemogenic Agent from Non-Leukaemic Tissues of (J. F. A. P. Miller), 703
Thymidine : Uptake of, and Synthesis of Deoxyribonucleic Acid in Mouse Ascites Cells (Dr. A. R Crathorn and Dr. K. V. Shooter), 614
Thymidine into Deoxyribonucleic Acid : Capacity of Extracts from Pre-starved *Escherichia coli* to Incorporate (Dr. Daniel Billen), 1044
Thymidine labelled with Tritium : Urinary Excretion of β-Amino-isobutyric Acid after Injection of (Dr. Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 956
Thymus Nuclei (Calf) : Water-soluble, Non-fibrous Deoxyribonucleoprotein from (Dr. Richard S. Walsh), 943
Thymus Nucleoprotein : Labilization of Deoxyribonucleic Acid in, after Whole-body Irradiation (Dr. Ulrich Hagen), 1123
Thyrotrophin labelled with Iodine-131 : Sialoadenectomy and the Distribution of (Prof. Arthur W. Wase and Dr. Yu Sheng Louise Feng), 778
Thyroxine : Transiodination of Proteins during Enzymic De-iodination of (Dr. J. R. Tata), 1025
Tick-borne Encephalitis : Virus and Antibodies in the Lymph and Blood of Sheep infected experimentally with the Virus of (Doubravka Málková), 716
Tick-borne Encephalitis Virus-infected Chick Embryo Fibroblast Cells : An Interferon-like Substance released from (Dr. J Vilček), 73
Ticks : Accessory Glands of Gene's Organ in (Dr. B. Feldman-Muhsam and Y. Havivi), 964
Tidal Flooding in London : Protection against (N. B. Webber), 293
Tikopia : Social Change in (Prof. Raymond Firth), *review* by Sir Harry Luke, 816
Tilapia : Interspecific Hybrids of—*T. nigra* x *T. zillii* (P. J. Whitehead), 878
Tilford, Shelby G., and others : Ultra-violet Absorption Spectra of the Diazines, 500
Tilley, Prof. C. E. : Farewell Dinner given by, to mark the retirement of Dr. W. A. Wooster, 25
Tillman, Dr. J. R. Progress in Semiconductors, *review*, 185
  Semiconductors and Transistors, *review*, 1058

Timber : Combating the Decay of, *review* by Prof. F. W. Jane, 977
  Decay of, and its Prevention (K. St. G. Cartwright and W. P. K. Findlay), *review* by Prof. F. W. Jane, 977
Timber Development Association : Open Days at the Research Laboratories, Penn, 994
Time : An Introduction to the Physics of Mass, Length and (Prof. Norman Feather), *review* by G. R. Noakes, 183
  Mass, Length and, *review* by G. R. Noakes, 183
Time of Local Aurorae : Atmospherics on 20 kc./s. at the (Father E. Gherzi), 225
Time (Choice Reaction) : Time Uncertainty and (Paul Bertelson and Jean-Paul Boons), 531
Time (Short-) Exposure to Ultra-violet Irradiation : Delayed Recovery of Airborne *Serratia marcescens* after (Dr. R. L. Dimmick), 251
Time and Gravitation (Space,) : The Theory of (V. Fock), translated from the Russian by N. Kemmer, *review* by Dr. D. W. Sciama, 4
Time-Scale : A Revised Geological (Prof. Arthur Holmes), 27
Time Signals : The International Co-ordination of, and Standard Frequency Transmissions (Dr. L. Essen), 452
Time Uncertainty and Choice Reaction Time (Paul Bertelson and Jean-Paul Boons), 531
Timmis, G. M. : Title of reader in chemistry in the University of London (at the Institute of Cancer Research, Royal Cancer Hospital) conferred on, 904
Timoshenko, S. P. : Engineering Education in Russia, 537
Tin Films : Speed of the Superconducting-Normal Transition in (D. J. Oliver, M. J. Rayner and E. H. Rhoderick), 492
Tincher, Wayne C., and others : Ultra-violet Absorption Spectra of the Diazines, 500
Tinggaard, Karl Aage (illustrated by) : Birds in Colour (with descriptions by Bruce Campbell), *review* by B. J. G. Maitland, 273
Tinline, Dr. R. D., and Zacharuk, R. Y. : Pathogenicity of *Metarrhizium anisopliae* (Metch.) Sor. and *Beauveria bassiana* (Bals.) Vuill. to Two Species of Elateridae, 794
Tinplate in Australia : Research on, 904
Tintometer, Ltd : A Handbook of Colorimetric Chemical Analytical Methods, fifth edition, *review* by A. M. G. Macdonald, 3
Tiros I (Satellite) : Cloud Pictures from, 647
Tissue (Connective), Thrombosis and Atherosclerosis—Proceedings of a Conference held at Princeton, N.J., 1958 (edited by Irvine H. Page), *review* by Dr. G. S. Boyd, 634
Tissue (Embryonic Plant) : Stabilization by Manganous Ions of Ribosomes from (Dr. J. W. Lyttleton), 1026
Tissue (Human Aortic) : Presence of Neutral Carbohydrates in (Dr. Sv. Bertelsen), 411
Tissue (Human Arterial) : Effect of Testicular Hyaluronidase on the Permeability of (Jørgen Matzke), 873
Tissue (Muscle), of an Albino Mouse : A Transplantable Spontaneous Osteogenic Sarcoma observed in the (R. G. Harne, M. Gregoire and G. Rona), 1129
Tissue Culture (Insect) : Growth by Cell Division in (Dr. B. M. Jones and I. Cunningham), 1072
Tissue Cultures : Plant, *review* by A. Allsopp, 976
Tissue Sections : Combined Oil-Immersion, Phase-contrast and Dark-ground Viewing of 'Thorotrast' in (Dr. E. W. Baxter), 162
Tissues of *Helix* : Physiological Media for (C. K. Goddard), 68
Tissues (Isolated), *in vitro* : Influence of the Ionic Strength of the Medium on the Anaphylactic Sensitization of (R. Binaghi, M. Liacopoulos-Briot, Dr. B. N. Halpern and P. Liacopoulos), 697
Tissues (Mammalian) : The β-D-Fucosidase Activity of, and its relation to other Glycosidases (Dr. G. A. Levvy), 1027
Tissues (Non-Leukaemic), of Thymectomized Mice : Recovery of Leukaemogenic Agent from (J. F. A. P. Miller), 703
Tissus Végétaux : La Culture des (Prof. R. J. Gautheret), *review* by A. Allsopp, 976
Titanium : Five Co-ordinated, in $K_2Ti_2O_5$ (Dr. Sten Andersson and Dr. A. D. Wadsley), 499
  The Fusion Electrolysis of (Dr. W. J. Kroll), 994
Titanium Metals and Compounds : Analytical Chemistry of (Maurice Codell), *review* by Prof. A. G. Quarrell, 725
Titanium Oxide : A Symmetrical Fourfold Helical Fracture in (J. S. Jackson), 1104
Titrations' ('Enthalpy), and Thermochemistry in Molten Salts (Prof. Joseph Jordan, Jurg Meier, Edward J. Billingham, jun., and James Pendergrast), 318
Titterton, Prof. E. W., and Brinkley, T. A. : Rare Modes in the Spontaneous Fission of Californium-252, 228
Tivy, Dr. Joy : The Geography of the Garth Area—the Central Highlands in Miniature, 200
Toad *Xenopus laevis* : Expanded Ilio-Sacral Joint in the (Margaret Palmer), 797
Tobacco Mosaic Virus : Polyphenol Oxidase Activity of *Nicotiana glutinosa* Leaves infected with (Dr. Masataka Kikuchi and Akira Yamaguchi), 1048
Tobacco Mosaic Virus Protein : A Difference between the Sub-Units of (Dr. H. G. Aach), 75
Tobe, Dr. M. L., and others : Orienting Effects in Octahedral Aquation, 477
Tocher, K. : At the second Annual Conference of the British Computer Society (A Common Computer Language), 655
Todd, Sir Alexander : New Horizons in Chemistry, 819
  The Chemistry of Natural Products (Natural Product Chemistry—Retrospect and Prospect), 1080
  Honorary degree of Doctor of Laws of the University of Melbourne conferred on, 1081
Todd, Sir Alexander, and others : Oxidative Phosphorylation—Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates, 59
Tolerance (Polyvalent Immunological), in Homologous Radiation Chimaeras (Alena Lengerová), 160
Tolerance Tests (Potassium), in South Indian People (Dr. G. Henrotte, G. Krishnamurthi and G. Ranganathan), 328
Tomatoes : Virus-Streak Disease of (B. H. MacNeill and Hikmet Ismen), 903
Tomnovec, F. M., and others : Fractionation of Nuclear Weapon Debris, 1100
Tong, Dr. J. E., and others : Preliminary Psychomotor Stress Studies with Subnormal Psychopathic Subjects, 172
Tongue, Harold : The Design and Construction of High Pressure Chemical Plant, second edition, *review* by Dr. K. E. Bett, 541
Tonks, Dr. Lewi : Electromagnetic Standing Waves and Ball Lightning, 1013
Tonolo, A., and others : Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238
Tooth Enamel : Organic Matrix of (J. E. Eastoe), 411
Toovey, F. W. : Glasshouse Crops Research Institute—Open Day, 204
Topographical Anatomy of the Dog (Dr. O. Charnock Bradley), sixth edition revised by Prof. Tom Grahame, *review* by Prof. T. Nicol, 451
Toriyama, Dr. Hideo : Behaviour of a Thread-like Apparatus in the Petiole of *Mimosa pudica*, 709
Tóro, Prof. Imre, and others : Increase of Esterase Activity during Intracellular Digestion in a Histophagous Ciliate, 65
Total Iron-binding Capacity in certain Mammals : Serum Iron and (Prof. Jose Planas and Siunio de Castro), 1126
Total and *l*(+) Tartaric Acid Inhibited Rat Serum Acid Phosphatase (Dr. Z. Laron and B. Epstein Halberstadt), 67
Tóth, József, and others : Increase of Esterase Activity during Intracellular Digestion in a Histophagous Ciliate, 65
Tottenham, H. C. : Appointed to the readership in structural engineering at the University of Southampton, 290
Towards a Unified Cosmology (Prof. Reginald O. Kapp), *review* by Dr. C. W. Kilmister, 634
Toxic Chemicals in Agriculture and Food Storage : Use of (Request from the Research Study Group for evidence), 290
Toxicity of Gibberellin to Seedless and Seeded Varieties of *Vitis vinifera* (Dr. Robert J. Weaver), 1135
Toxicology : Handbook of, Vol. 3, Insecticides (William O. Negherbon), *review* by Prof. V. B. Wigglesworth, 544
Traces of Metals : Colorimetric Determination of (Prof. E. B. Sandell), third edition, *review* by A. M. G. Macdonald, 3
Trained Manpower Problems : The Public Service in New States—a Study in some (Kenneth Younger), 971
Training of Professional Radio and Electronics Engineers : Education and (British Institution of Radio Engineers Report on), 115
Training in Radiological Health and Safety (Prof. J. E. Roberts), 471
Training of Teachers for Health Education (United Nations, World Health Organization, Technical Report Series No. 193), 648
Training Colleges : Recruits to Teaching—a Study of the Attainments, Qualifications and Attitudes of Students entering (F. W. Land), 750
Training Facilities (Nuclear), at the Royal Naval College, Greenwich (Prof. J. Edwards, 545
Training Grants in Plastics Technology (Plastics Institute), 28
Trans-Atlantic Frequency Comparison between Caesium-controlled Oscillators : The 'GBR Experiment'—a (J. A. Pierce, G. M. R. Winkler and R. L. Corke), 914
Transfer (Heat), in Cold-Cathode Arcs : Stepwise Ablation and (Dr. A. von Engel and Dr. K. W. Arnold), 1101
Transfer (Linear Energy) : Effects of, on the Radiolysis of Water and Heavy Water (Dr. E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Transfer (Turbulent), in the Lower Atmosphere (Dr. C. H. B. Priestley), *review* by Prof. P. A. Sheppard, 974
Transfer Reactions (Fast) : Physiological Role of (Massachusetts Institute of Technology Seminar Lectures on), 904
Transferase (Glucoronosyl) : Inhibition of, by Progestational Agents from Serum of Pregnant Women (Dr. David Yi-Yung Hsia, Robert M. Dowben, Ralph Shaw and Aaron Grossman), 693
Transformable Bacteria : Fate of Transforming Deoxyribonucleate following Fixation by, 1 (Dr. Maurice S. Fox and Dr. Rollin D. Hotchkiss), 1002 , 2 (Dr. Maurice S. Fox), 1004
Transformation of Resistance to 8-Azaguanine in *Diplococcus pneumoniae* (Francis M. Sirotnak, Ramona B. Lunt and Dorris J. Hutchison), 800
Transformation (Microbiological), of Terpenes—Hydroxylation of α-Pinene (P. K. Bhattacharyya, B. R. Prema, B. D. Kulkarni and S. K. Pradhan), 689
Transforming Deoxyribonucleate : Fate of, following Fixation by Transformable Bacteria, 1 (Dr. Maurice S. Fox and Dr. Rollin D. Hotchkiss), 1002 ; 2 (Dr. Maurice S. Fox), 1004
Transhydrogenase Reaction : Histochemical Localization of Human, Term Placental 17β-Œstradiol Dehydrogenases—Implications for the (Dr. Donald A. Kellogg and Dr. George G. Glenner), 763
Transiodination of Proteins during Enzymic De-iodination of Thyroxine (Dr. J. R. Tata), 1025
Transistor (The Junction), and its Applications (edited by E. Wolfendale), *review* by Dr. J. R. Tillman, 1058
Transistors (A. C. Gillie), *review* by Dr. J. R. Tillman, 1058
  Semiconductors and, *review* by Dr. J. R. Tillman, 1058
Transition (Fibrinogen-Fibrin) : Some Aspects of the (K. Laki, Jules A. Gladner and J. E. Folk), 758
Transition (Olivine-Spinel), on Nickel Orthosilicate (Dr. A. E. Ringwood), 1019
Transition (Superconducting-Normal), in Tin Films : Speed of the (D. J. Oliver, M. J. Rayner and E. H. Rhoderick), 492
Transition Group (Second) : Ferromagnetic and Antiferromagnetic Behaviour in the (Dr. B. R. Coles and D. Griffiths), 226
Transition Metal Ethylenediamine Tetraacetic Acid Chelates : Differential Thermal Analysis of some (Prof. Wesley W. Wendlandt and G. Robert Horton), 769
Transits of Venus—a Study of Eighteenth-Century Science (Prof. Harry Woolf), *review* by Dr. David S. Evans, 636
Translations of Russian Biological Publications (American Institute of Biological Sciences), 558
Translations (Scientific) : Israel Programme for, 832
Translocation of Wild Animals as a Means of Game Control (Dr. A. M. Harthoorn, J. A. Lock and J. MacKeand), 518
Transmission : Autonomic Nerve-Smooth Muscle (G. Burnstock and Mollie E. Holman), 951
  Data (Benelux Section of the Institute of Radio Engineers, in co-operation with the Nederlands Radiogenootschap and the Group on Communications Systems of the Institute of Radio Engineers International Symposium on), 290
Transmission of Colicinogeny : Genetic Recombination in *Salmonella typhimurium* occurring during (Dr. Ozeki and Dr. Howarth), 649
Transmission of a Gall Disease of Cocoa (A. L. Wharton and A. A. Brunt), 80

Transmission (Sound) : Introduction to the Theory of, with Application to the Ocean (Prof. C. B. Officer), *review* by Dr. A. B. Wood, 539
Transmission (Spinal), of Proprioceptive Hind-Limb Reflexes : Velocity of Conduction and (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 132
Transmissions (Frequency) : The International Co-ordination of Time Signals and Standard (Dr. L. Essen), 452
Transmutation of Species : Darwin's Notebooks on (edited by Sir Gavin de Beer), Part 2, 26 ; Part 3, 649 (British Museum (Natural History)).
Transphosphorylation : Synergism of Bivalent Metal Ions in (Dr. John M. Lowenstein), 570
Transplantable Spontaneous Osteogenic Sarcoma observed in the Muscle Tissue of an Albino Mouse (R. G. Herne, M. Gregoire and G. Rona), 1129
Transplanted Bone Marrow Cells in Radiation Chimaeras : Identification of (P. Czerski, O. Rosiek and J. Sabliński), 955
Transport (Auxin) : A Method for the Detection of Inhibition of (B. E. S. Gunning), 428
Transport (Potassium) : A Bacterial Mutant with Impaired (Dr. Stanley G. Schultz and Dr. A. K. Solomon), 802
Traps : Vent-Axia Insect Suction, 559
Travel (Space) : Biology of (Institute of Biology Symposium on), 29
  Designing for, *review*, 884
Travel Awards for Women Engineers (Caroline Haslett Memorial Trust), 116
Travelling Fellowships in Medicine, 994
Travis, N., and others : Excited Electronic States of Lithium and Sodium Molecules, 141
Treasury, H.M. : Assistance from the United Kingdom for Overseas Development, 266
Treating Soils with N Sodium Hydroxide : Ammonia released on, as a Possible Means of Predicting the Nitrogen-supplying Power of Soils (A. H. Cornfield), 260
Treatise (A New), on Plant Physiology, *review* by Prof. Walter Stiles, 889
Treatment of Hypertension : Drugs for the (Manchester and District Section of the Royal Institute of Chemistry, and the Manchester Section and Fine Chemicals Group of the Society of Chemical Industry Symposium on), 743
Treatment of *Leishmania donovani* Infections with Surface-active Agents (Dr. J. D. Fulton), 1129
Treatment (Heat), of Metals and Alloys (Société Française de Métallurgie Meeting on), 559
Tremor (Ottawa Symposia on Self-Regulation in Living Systems, 3), 297
Trends in the Theory of the Ionosphere : Recent (J. A. Ratcliffe), 853
Trends (Population), among Hawks and Owls in Illinois (Richard R. Graber and Jack S. Golden), 999
Treshnikov, A. F. : Recent Progress in the Oceanography Studies in the Arctic, 287
Triassic Salt—Discoveries in the Cheshire–Shropshire Basin (Sir William Pugh), 278
Tribolium : Taxonomic Significance of Spermathecal Structure in some Species of (Gordon Surtees), 1138
Trifolium (Genus) : Axial Origin of the Terminal Inflorescence in the (Yvonne Aitken), 622
Trimethylhexadecylammonium (Cation) : Reduction of the Intestinal Absorption of Glucose, Methionine and Sodium Butyrate by the (Dr. J. A. Nissim), 308
Trinuclear Basic Acetates : Structure of the (Dr. L. E. Orgel), 504
Triphosphate (Adenosine), and Maintenance of Shape of the Human Red Cells (Makoto Nakao, Toshiko Nakao and Saburo Yamazoe), 945
Tristram, Dr. G. R. : At the Nineteenth Meeting of the Research Panel of the British Gelatine and Glue Research Association (A Preliminary Study of the Thermal Conversion of Acid-Soluble Calf-skin Collagen into Gelatin), 998
Tritium : Effect of Cocaine on the Disposition of Noradrenaline labelled with (Dr. L. G. Whitby, G. Hertting and Dr. J. Axelrod), 604
  Urinary Excretion of β-Amino-isobutyric Acid after Injection of Thymidine labelled with (Dr. Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 956
Trocheris, Michel : Les Modèles du Noyau, *review* by Dr. J. M. Soper, 979
Tropical Agriculture, Imperial College of : To be merged into the University College of the West Indies, 374
Tropical Climates and Biology (Dr. G. S. Carter), 843
Tropical Products Institute : Appointment of Dr. P. C. Spensley as acting director, 117
Troup, G. W. : The Development of Pulp and Particle Board Industries and their Effect on Forest Management (The Evaluation of the Economists), 33
Trout (Sea-) Marked in Devonshire : Recapture in the River Tweed of a (A. Swain, I. R. H. Allan and M. J. Bulleid), 877
Trypan Blue : Effect of, on Rat Embryos (F. Beck, Dr. B. Spencer and Prof. J. S. Baxter), 605
D,L-Tryptophan-3-^{14}C in *Brassica oleracea* L. : Biogenesis of Ascorbigen, 3-Indolylacetonitrile and Indole-3-carboxylic Acid from (Dr. M. Kutáček, Dr. Z. Procházka and Dr. D. Grunberger), 61
Tsetse Fly (*Glossina*) : Free Amino-Acids of the (E. Bursell), 778
Tuan, Dr. T. F. : Appointed to a Research Fellowship in mathematical physics at the University of Birmingham, 465
Tube (Heated) : Effect of Specular Reflexions on the Radiation Flux from a (Sir K. S. Krishnan), 135
Tuberculin Sensitivity : Production of (Prof. Hubert Bloch and Albert A. Nordin), 434
Tuberculosis—Risk to Family Contacts, 1084
Tuberculosis in Animals (Zoological Society of London Symposium on), 996
Tuberculosis (Experimental) : Effect of *Candida albicans* on the Evolution of (Dr. E. Mankiewicz and Dr. M. Liivak), 250
Tuberculous Infection (Primary) : Effect of a, on the Resistance of Male and Female Mice to Ectromelia (Dr. A. W. Gledhill and Dr. R. J. W. Rees), 703
Tuck, James L. : A New Plasma Confinement Geometry, 863
Tucker, K. J., and others : Formation of Fayalite in Roast Reduced Jaspilite, 683
Tucker, M. J. : Echo-Sounding Experiments in the Barents Sea, 855
Tumey, S. B., and others : 5-Hydroxytryptamine in Cerebrospinal Fluid, 324
Tumour Blood Supply : A Rapid Method for studying, using Lissamine Green (L. N. Owen), 795
Tumour Cells (Ascites), *in vitro* : Optical Protein Synthesis by (Dr. M. J. Fraser), 1114
Tumour Formation : Polyoma Virus Mutant with a Reduction in (Dr. Leo Sachs and Dan Medina), 715
Tumour-destroying Virus : Isolation of a Non-pathogenic, from Mouse Ascites (Dr. J. G. Bennette), 72
Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin on Tumours induced in Mice by Methylcholanthrene (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Tumours : Chromosome Ploidy and Radiosensitivity of (László Révész and Ulla Norman), 861
Tumours induced in Mice by Methylcholanthrene : Tumour-promoting Effect of Excessively Large Doses of Oral Griseofulvin on (Louis L. Barich, Takashi Nakai, Jan Schwarz and Donna Jean Barich), 335
Tumours in *Rattus (Mastomys) natalensis* : Production of, by Polyoma Virus (Dr. Alan S. Rabson, William J. Branigan and Frances Y. Legallais), 423
Tumours (Human) : Polyploidy in (N. B. Atkin and Angela J. Ross), 579
Tumours (Mouse) : Localization of a Halogenated Porphyrin in (K. I. Altman and Prof. K. Salomon), 1124
Tunguska Meteorite : The (V. N. Rodionov and M. A. Tzikulin), 1077 ; (B. I. Vronsky), 1078 ; (E. L. Krynov), 1078
Tupper, R., and others : Zinc Content of Erythrocytes and Leucocytes of Blood of Normal and Leukaemic Subjects, 302
Turbostratic Structure of Clays : Domain or (L. A. G. Aylmore and Dr. J. P. Quirk), 1046
Turbulent Diffusion in the Atmosphere : Small-Scale (Dr. L. A. Clarenburg and C. E. Spaans-v. d. Tang), 586
Turbulent Transfer in the Lower Atmosphere (Dr. C. H. B. Priestley), *review* by Prof. P. A. Sheppard, 974
Turco, Dr. A., and others : Structure of $AgSCN.P(n\text{-}C_4H_9)_3$, 772
Turnbull, David (edited by Frederick Seitz and) : Solid State Physics—Advances in Research and Applications, Vols. 7, 8, 9 and 10, *review* by Dr. R. O. Davies, 886
Turnbull, Prof. H. W. : The Correspondence of Isaac Newton, Vol. 1, 1661-1675, *review* by Prof. L. Rosenfeld, 537
Turner, D. T. (Mullins, L., and) : Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber, 145
Turner, Prof. E. E. : Title of professor emeritus of chemistry in the University of London conferred on, 466
Turner, P. C. R., and others : Staining for Iodine in Chromatograms of Human Plasma—an Artefact due to Thioureas or Thiouracils, 691, *erratum*, 1079
Turner, R. C., and others : Alpha Activity of certain Botanical Materials, 208
Tursky, Dr. T. : Effect of Potassium Cyanide Poisoning on the γ-Aminobutyric Acid-Level in the Brain, 322
Tweed (River) : Recapture in the, of a Sea-Trout marked in Devonshire (A. Swain, I. R. H. Allan and M. J. Bulleid), 877
Twentieth Century Darwinism : Genetics and (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 24), *review* by Dr. H. Kalmus, 726
Twinning (Mimetic), in Urea–Ammonium Bromide (C. G. C. Catesby), 765
Twins (One-Egg), in the Mouse : Dichorial (Dr. A. J. Bateman), 339
Twitch (Muscle), and Tetanus : pH Changes during (A. Distèche), 1119
Two Aspects of Science (Sir George Thomson), 837
Two Heredities : The, *review* by Dr. J. D. Nisbet, 446
Two Means : Significance of the Difference between, when the Population Variances may be Unequal (John B. de V. Weir), 438
Two-Neuron Arc : Properties of the (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 134
Two R's of Plant Breeding, *review* by Dr. G. Haskell, 184
Two Types of Catalase-like Activity in Lactic Acid Bacteria (R. Whittenbury), 433 ; *erratum*, 466
Type of Host Plant Crop in Successful Biological Control of Insect Pests : Significance of the (D. C. Lloyd), 430
Types (Different), of Malnutrition : Influence of, on the ^{14}C-Lysine Metabolism in Young Rats (Prof. Kurt Schreier and Corinna Kazassis), 1117
Types (Two), of Catalase-like Activity in Lactic Acid Bacteria (R. Whittenbury), 433, *erratum*, 466
Tyrrell, A. C., and others : Isotopic Analysis of Silicon by Solid-Source Mass Spectrometry using Negative Ions, 683
Tzikulin, M. A. (Rodionov, V. N., and) : The Tunguska Meteorite, 1077

UBICHROMENOL in *Aspergillus fumigatus*, Fresenius : Ubiquinone (50) and (N. M. Packter and Dr. J. Glover), 413
Ubiquinone (50) and Ubichromenol in *Aspergillus fumigatus*, Fresenius (N. M. Packter and Dr. J. Glover), 413
UHF and VHF Bands : Television Field Trials of 405-Line and 625-Line Systems in the, 1957-1958 (British Broadcasting Corporation), 288
Uhler, Dr. R. L., and Hungate, Dr. F. P. : Relative Availability of some Strontium-90 Compounds in Soil, 252
Uhr, Jonathan W. : Development of Delayed-type Hypersensitivity in Guinea Pig Embryos, 957
Uhr, Jonathan W., and others : Delayed-type Hypersensitivity in Premature Neonatal Humans, 1130
Ujiie, Yukio, and others : High-Energy Bound Phosphate and Diabetes Mellitus, 702
Ulrich, Dr. Frank : Sodium and Potassium in Mitochondrial Membrane Fractions, 949
Ulrych, T. J., and others : Precision Intercomparisons of Lead Isotope Ratios—Broken Hill and Mount Isa, 754
Ultracentrifugation of Biological Macromolecules (Colloid and Biophysics Committee of the Faraday Society Discussion on), 905
Ultrasonic Velocities in Aqueous Electrolyte Solutions (Dr. C. G. Balachandran), 136
Ultra-sonic Velocity and Latent Heat of Vaporization : A Relation between (Prof. B. Ramachandra Rao and P. R. K. L. Padmini), 311
Ultra-thin Sections : A Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of (Miguel Rubio-Huertos and Paul R. Desjardins), 1043

- Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal . Absorption of Ultra-violet and Visible Light by (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
- Ultra-Violet Absorption Spectra of the Diazines (Prof. K. Keith Innes, James A. Merritt, Wayne C. Tincher and Shelby G Tilford), 500
- Ultra-Violet Absorption Spectra of the Molecules H_2O, HDO and D_2O (Dr. Jack Barrett and Dr. A. L. Mansell), 138 ; (R M. Golding), 139
- Ultra-Violet Absorption Spectra of Proteins in Deuterium Oxide (Dr. Shiro Takashima), 597
- Ultra-Violet Irradiation : Delayed Recovery of Airborne *Serratia marcescens* after Short-Time Exposure to (Dr R. L. Dimmick), 251
- Ultra-Violet Irradiation (Localized) : Influence of, on the Incorporation of Adenine-8-^{14}C and D,L-Methionine-^{35}S in *Acetabularia mediterranea* (Prof J. Brachet and Dr. M. J. Olszewska), 954
- Ultra-Violet Light : Potentiation of Hair-Growth by (B. E. Johnson), 159
  - Recovery in the Presence of Chloramphenicol of *Escherichia coli* B (H) Irradiated with (Kenshi Suzuki and Yukiko Iwama), 347
- Ultra-Violet and Visible Light : Absorption of, by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal (Sabri Ergun, J. T. McCartney and R E. Walline), 1014
- Uncertainty (Time), and Choice Reaction Time (Paul Bertelson and Jean-Paul Boons), 531
- Uncoupled Rat Liver Mitochondria : A High-Energy Phosphate Requirement for Succinate Oxidation in (Dr. Giovanni Felice Azzone and Dr Lars Ernster), 65
- Under-developed Countries . Support for, 971
- Under-developed Countries of the World, 266
- Understanding and Power, 809
- Underwood, Dr. E Ashworth : *Obituary* of Prof. Charles Singer, 827
- Undritz, E., and others : Sickling Phenomenon in Deer, 333
- Unequal : Significance of the Difference between Two Means when the Population Variances may be (John B de V. Weir), 438
- Unesco : Scientific Institutions and Scientists in Latin America, Vol 4, Argentina, 29
  - Symposium on Problems of the Arid Zones, 295
  - Fellowships for Research in the Use of Electronic Computers, 465
  - Educational Studies and Documents No. 36, Technical and Vocational Education in the U.S.A.—a Bibliographical Survey prepared by the United States Office of Education, 741
  - International Symposium on Cell Biology and Growth Inhibition, 836
- Unidentified Pharmacologically Active Substance extracted from Cerebral Hemispheres (P. F. L. Andrews, Shirley A. P. Price and Dr. G. B. West), 420
- Unification of Analytical Approaches to Engineering Problems, *review* by Prof J. Greig, 359
- Unified Cosmology Towards a (Prof. Reginald O. Kapp), *review* by Dr. C. W. Kilmister, 634
- Uniform Methods of Sugar Analysis, International Commission for : Report of the Proceedings of the Twelfth Session, Washington, D.C., 1958, *review* by Prof. E. L. Hirst, 9
- Union Carbide, Ltd. : Grant of £2,150 per annum (for three years in the first place) to the University of Southampton, to provide for a research fellowship and a research studentship in the Department of Chemistry, 743
- Uniqueness of Adenylic Acid in the Mediation of the Mutagenic Activity of Formaldehyde—Mechanism of Formaldehyde-induced Mutagenesis—the (Dr. Thomas Alderson), 485
- United Kingdom : Assistance from the, for Overseas Development (H.M. Treasury), 266
- United Kingdom Agricultural and Food Attaché in Argentina, 1075
- United Kingdom Atomic Energy Authority . *Zebra* (Zero Energy Breeder Reactor Assembly), 114
  - Report of the Committee on Training in Health and Safety to the Authority Committee on Health and Safety, 471
  - Sixth Annual Report (1959–60), 1082
  - Atom 1960—an Illustrated Summary of the Sixth Annual Report, 1084
  - Re-appointment of Lord Citrine, Sir James Chadwick and C. F. Kearton as part-time members, 743
  - Course for Trade Union Officials on the Industrial Uses of Radioisotopes, 905
  - *Hector*, a New Research Reactor, 992
- United Kingdom Atomic Energy Authority and the Agricultural Research Council : Joint Report on the Deposition of Strontium-89 and Strontium-90 on Agricultural Land and their Entry into Milk after the Reactor Accident at Windscale in October 1957, 1077
- United Kingdom Atomic Energy Research Establishment : Wantage Research Laboratory (B S Smith), 292
  - Appointment of Dr F A. Vick as director, 556
  - Appointment of Dr R Spence as deputy director, 556
  - Appointment of L. Grainger as assistant director, with special responsibilities for applied Research, 556
  - Radioactive and Natural Strontium in Human Bone (J. W. Arden, F J Bryant, E. H. Henderson, G. D Lloyd and A. G. Morton), 994
- United Kingdom Commonwealth Scholarship Commission : Scholarship Awards, 464
- United Kingdom Scientific Mission in Washington Appointment of Dr. H T. Hookway as director, 24
- United Nations (Food and Agriculture Organization) : Problems of the Arid Zones (Nomadism in relation to Grazing Resources—Nomadic Pastoralism), 296
  - Appointment of Dr. Marcel Autret as director of the Nutrition Division, 743
- United Nations (World Health Organization) · Technical Report Series No 192, Epidemiology of Cancer of the Lung, 115
  - Classification of Pharmaceutical Preparations—a Survey of Existing Legislation, 287
  - Public Health Papers No 3, Health Services in the U.S S R., 379
  - Technical Report Series No. 194, Local Health Service, 465
  - Official Records of the, No. 98, The Work of WHO, 1959—Annual Report of the Director-General to the World Health Assembly and to the United Nations, 468
  - Technical Report Series No. 193, Training of Teachers for Health Education, 648
  - Guide to Hygiene and Sanitation in Aviation, 911
- United States . Change of the Chlorine—Sodium Ratio in the Atmosphere with Altitude and Distance from the Source of Sodium Chloride, and the Distribution of Atmospheric Nitrate over the (Dr. Henry M. Papée and Dr Alberto Montefinale), 1103
  - Control of Scientific Research in the, *review* by R. Brightman, 181
  - Water Resources in the (Prof. W G V. Balchin), 562
- U.S.A. : Technical and Vocational Education in the—a Bibliographical Survey prepared by the United States Office of Education (Unesco, Educational Studies and Documents No. 36), 741
- United States Air Force Cambridge Research Center (Geophysics Research Directorate), with the co-operation of Lowell Technological Institute Research Foundation : Exploding Wires—Based on Conference on the Exploding Wire Phenomenon, 1959 (edited by William G. Chace and Howard K. Moore), *review* by Dr B. A. Thrush, 726
- United States Army (Mathematics Research Center) . Boundary Problems in Differential Equations—Proceedings of a Symposium held at the University of Wisconsin, 1959 (edited by Prof. Rudolph E. Langer), *review* by Prof E. T. Copson, 451
- United States Department of Agriculture : Supplements 9 and 10 to the Index-Catalogue of Medical and Veterinary Zoology, 559
- United States Department of Defense (Department of the Navy, Naval Research Advisory Committee) Basic Research in the Navy (Report prepared by Arthur D. Little, Inc.), 178
- United States Department of Health, Education and Welfare : Publication No. 739, Highlights of Research Progress in General Medical Sciences (1959), 200
  - Appointment of Dr. J H. Gerber as director of the Center for Aging Research, National Institutes of Health, 374
- United States Gas Chromatography Research Center (Barber-Colman Company, Houston), 289
- United States Information Service : Title of *Atoms for Peace Digest* changed to *Science Horizons*, 902
- United States Materials Research and Development for National Security, 470
- United States National Academy of Sciences : Election of Foreign Associates, 198
- United States National Academy of Sciences—National Research Council · Formation of a Committee on Chemical Control of Agricultural Pests and Conservation of America's Wild-Life, 114
  - The Biological Effects of Atomic Radiation, 380
  - Publication No. 718, More Effective Organization and Administration of Materials Research and Development for National Security, 470
  - Appointment of Prof Robert C. Elderfield as chairman of the Division of Chemistry and Chemical Technology, 647
  - Appointment of Dr. Edward P. Espenshade, jun., as chairman of the Division of Earth Sciences, 647
  - Appointment of Dr Emil W. Haury as chairman of the Division of Anthropology and Psychology, 647
  - Appointment of Prof. J Barkley Rosser as chairman of the Mathematics Division, 647
  - Publication No. 713, Digest of Literature on Dielectrics, Vol. 22, 1958 (edited by R A. Sodermann and L. F. Frisco), *review* by S. Weintroub, 728
  - Annual Report for 1958-59, 749
  - Nuclear Science Series, Report No. 29 (Publication No. 752) : Penetration of Charged Particles in Matter—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (edited by A. Vehling), 1086
- United States National Academy of Sciences—National Research Council (International Union of Nutritional Sciences of the), and others : Fifth International Congress on Nutrition, 201

- United States National Research Council—National Academy of Sciences, (International Union of Nutritional Sciences of the), and others : Fifth International Congress on Nutrition, 201
- United States National Science Foundation : Grant of 500,000 dollars to the University Corporation on Atmospheric Research to assist in establishing the United States National Centre of Atmospheric Research, 200
  - Grants for Graduate Research Laboratories, 559
  - Financial support for the construction of the National Radio Astronomy Observatory at Green Bank, West Virginia, and the Kitt Peak National Observatory, Tucson, Arizona, 910

United States Office of Education (prepared by): Technical and Vocational Education in the U.S.A.—a Bibliographical Survey (Unesco, Educational Studies and Documents No. 36), 741
United States Record of Published Books, 116
United States Weather Bureau: World Weather Records, 1941-50, *review* by H. H. Lamb, 727
Universe: The Hollow (Prof Charles de Koninck), *review* by F. I. G. Rawlins, 890
Universities (British): Graduate Schools in (Prof. W. R. Niblett), 560
Universities (New Zealand) Report of the Committee on, 107
Universities Council for Adult Education: Report on the Year 1958-1959, 906
Universities Federation for Animal Welfare · Summer Congress, 374
University of Adelaide Appointment of Prof. R. N. Robertson as professor of botany, 740
  Appointment of Dr. H. B. S. Womersley as acting-head of the Department of Botany, 740
University of Birmingham: Appointment of Dr Stanley Mandelstam to the newly established chair of mathematical physics, 117, 197
  Appointment of Dr. R W. Whitworth and Dr. A. B. Robbins as lecturers in physics, 117
  Appointment of Dr. J. R. Majer as lecturer in chemistry, 117
  Appointment of Dr F. W. J. Teale and Dr. D. G. Walker as lecturers in biochemistry, 117
  Appointment of Dr. E. H. Creaser as lecturer in microbiology, 117
  Appointment of Dr. D. F. Gibbons as lecturer in physical metallurgy, 117
  Appointment of A. H. M. Hoare to a research fellowship in pure mathematics, 117
  Appointment of J. S. Lilley to a research fellowship in physics, 117
  Appointment of B Cockayne to a research fellowship in physical metallurgy, 117
  Appointment of E. N. Corlett as senior research fellow in the Department of Engineering Production, 117
  Appointment of Dr. L. E. Bush to the Bowman chair of physiology and to the directorship of the Department of Physiology, 465
  Title of professor of physiological chemistry conferred on Dr. W. V. Thorpe, 465
  Appointment of Dr. J. D. Dowell, Dr. P. Swinbank and C. P. van Zyl as lecturers in physics, 465
  Appointment of Dr. J. M. Webber as lecturer in chemistry, 465
  Appointment of K. Foster as lecturer in mechanical engineering, 465
  Appointment of Dr. G. W. Rose as lecturer in industrial metallurgy, 465
  Appointment of Dr V. J. Emery as lecturer in mathematical physics, 465
  Appointment of Dr. E. F. Stack-Forsyth as lecturer in electrical engineering, 465
  Appointment of R. N. Morris as lecturer in econometrics and social statistics, 465
  Appointment of Dr. T. F. Tuan to a research fellowship in mathematical physics, 465
  Appointment of Dr. N. Pessall and B. Cockayne to research fellowships in physical metallurgy, 465
  Appointment of D. J. White to be Kenward Memorial Fellow in engineering production, 465
  Appointment of H. R. Shaylor as Staff Fellow in nuclear physics, 465
  Grant of £26,000 to Prof. J. Sayers for Space Research (electron and ion-population studies of the upper atmosphere and interplanetary space), 744
University of Bristol: Appointment of Prof. T. K. Ewer to the newly established chair of animal husbandry, 465, 647
  Appointment of Dr. P. C. Caldwell as lecturer in biochemistry within the Department of Zoology, 465
  Appointment of A. J. B. Cruickshank as lecturer in physical chemistry, 465
  Appointment of Dr. I. O. Sutherland as lecturer in organic chemistry, 465
  Appointment of Dr. P. H. Fowler to a research fellowship in physics, 465
University of California: Appointment of Prof George N. Briggs as chairman of the Department of Nutrition in the College of Agriculture, 290
University of Cambridge: Appointment of Dr A. S. Parkes to the newly established Marshall chair of the physiology of reproduction, 113
  Grant of £250 from the Gulbenkian Foundation to the expedition to British Guiana, 558
  Election of C. St J Wilson to a Fellowship of Churchill College, 742
  Election of R. A Y. Jones, A. O. Gilchrist, C.'B. Cottrell and A. Howie to Junior Research Fellowships of Churchill College, 742
  Election of Prof. E. E. Saltpeter and Dr. J. D. Watson to Overseas Fellowships of Churchill College, 742
  Grants for Space Research—£1,694 to Dr. K. G. Budden (for research into the theory of propagation of radiations from artificial satellites); £2,678 to Prof. M Ryle (for the recording and the interpretation of Doppler and Faraday effects in the radiations from artificial satellites); and £11,230 to Dr. F. G. Smith (for the measurement of cosmic radio noise by receivers mounted on rockets and satellites), 744
University of Canberra: Appointment of Prof. L. G. H. Huxley as vice-chancellor, 290
University of Cape Town: Appointment of Dr. J. M. Winterbottom as director of the Percy Fitzpatrick Institute of African Ornithology, 201
University of Durham: Grant of £2,700-£3,400 over two years from the Gulbenkian Foundation to the Institute of Education, 558
University of Edinburgh: Appointment of Dr. J. P. Duguid as reader in bacteriology, 465
  Appointment of Dr. C. A. Beevers as reader in chemistry, 465
  Appointment of J. R. Small as lecturer in accounting and business methods, 465
  Appointment of Dr. C. G. Thomson as lecturer in clinical chemistry, 465
  Appointment of Dr. D. J. McAuliffe as lecturer in ophthalmology, 465
  Appointment of Dr. F. M. Martin as lecturer in public health and social medicine, 465
  Appointment of Dr. P. H. Calderbank to the chair of chemical technology, 555
University of Giessen (Justus Liebig): Roentgen Prize awarded to J. B Adams, 201
University of Leeds: Retirement of Prof. E. A. Spaul from the chair of zoology, 197
  Appointment of Dr. J. M Dodd to the chair of zoology, 197
  Appointment of Dr. F. Hepburn as lecturer in medical physics, 465
  Grant of £5,000 from the Department of Scientific and Industrial Research to the Department of Physics, 465
  Grant of £2,100 from the Cement and Concrete Association to the Department of Civil Engineering, 465
  Grant of 7,000 dollars from the Muscular Dystrophy Association of America to the Department of Biomolecular Structure, 465
University of Leicester: Appointment of Dr. S. G M. Lee to the new chair of psychology, 743, 901
  Appointment of Dr. M. C. R. Symons to the new chair of physical chemistry, 743
  Appointment of Dr. H. L. Kornberg to the new chair of biochemistry, 743, 1075
  Appointment of W. B. Birmingham as senior lecturer in economics, 743
  Appointment of Dr. J E. Brown, Dr. O. P D. Cutteridge, and Dr. R W. Maxwell as senior lecturers in engineering, 743
  Appointment of P. S Cohen as lecturer in sociology, 743
  Appointment of D. J Cockrell as lecturer in engineering, 743
  Appointment of Dr. W. Sluckin as lecturer in psychology, 743
  Grant of £13,006 to Prof. E. A. Stewardson for Space Research (for investigations of solar and stellar soft X-Ray emissions), 744
University of Liverpool: Appointment of R. L Plackett as reader in mathematical statistics, 117
  Appointment of A. C. Shuttleworth as reader in veterinary surgery, 117
  Appointment of Dr. C. L. Smith as reader in zoology, 117
  Appointment of Dr. A. S. Aldred to a senior lecturership in electric power engineering, 117
  Appointment of Dr. A. Bolton to a senior lecturership in civil engineering, 117
  Appointment of Dr. H. W. Douglas and Dr. T B. Grimley to senior lecturerships in inorganic and physical chemistry, 117
  Appointment of Dr V. H. Heywood to a senior lecturership in botany, 117
  Appointment of Dr. J. F. Norbury to a senior lecturership in fluid mechanics, 117
  Appointment of Dr. T. G. Richards to a senior lecturership in physiology, 117
  Appointment of Dr. I. C. Geddes to a senior lecturership in anaesthesia, 117
  Anpointment of Dr. J S. Scott to a senior lecturership in obstetrics and gynaecology, 117
University of London: Appointment of Dr. P. G. Saffman as reader in mathematics at King's College, 117
  Appointment of Dr. D. V. Ager as reader in geology at the Imperial College of Science and Technology, 117
  Appointment of Dr. M. Shepherd as reader in psychiatry at the Institute of Psychiatry, 117
  Title of professor of physics in the University (at University College) conferred on Dr. E. H. S Burhop, 201
  Grant of £3,800 from the Leverhulme Trust Fund to Queen Elizabeth College, to enable a sociological research programme to be started in the Department of Nutrition, 201
  Appointment of Dr. Paul Morpurgo as Leverhulme Research Fellow in the sociology of nutrition at Queen Elizabeth College, 201
  A Wellcome Research Fellowship awarded to Dr. Angela E. R. Taylor to enable her to undertake research on the metabolic requirements of helminths, using radioactive tracers, in the Department of Biology at Queen Elizabeth College, 201
  Grant of £56,000 from the London Research Foundation to Queen Elizabeth College, to further the research work of the Department of Nutrition, with special reference to its work on fertility control, 201
  Retirement of Prof W. Robson from the University chair of biochemistry at King's College, 286
  Appointment of Dr. H. Harris to the University chair of biochemistry at King's College, 286
  Westfield College—New Faculty of Science, 361
  Appointment of Prof E. H. Bellamy to the chair of physics at Westfield College, 361
  Appointment of Prof. W. Klyne to the chair of chemistry at Westfield College, 361
  Appointment of Prof. G. E. Fogg to the chair of botany at Westfield College, 362
  Appointment of Prof. J. E. Webb to the chair of zoology at Westfield College, 362
  Appointment of Prof. E. B. Sondheimer to the chair of mathematics at Westfield College, 363
  Foundation Oration at Goldsmiths' College, The Diffusion of Knowledge (Dr. Michael Grant), 371
  Appointment of A F. Huxley as Jodrell professor of physiology at University College, 371
  Seminar at University College on Colloid and Polymer Science, 378
  Appointment of Sir Willis Jackson to the chair of electrical engineering at the Imperial College of Science and Technology, 463
  Appointment of Dr. C. B. B. Downman to the Sophia Jex-Blake chair of physiology at the Royal Free Hospital School of Medicine, 466
  Appointment of Dr. I. Doniach to the chair of morbid anatomy at the London Hospital Medical School, 466
  Appointment of Dr. J. Hamilton to the second chair of physics at University College, 466, 555
  Appointment of A. J. Buller to the readership in physiology at King's College, 466
  Appointment of J. C. de Courcy Henderson to the readership in reinforced concrete structures at the Imperial College of Science and Technology, 466
  Title of professor of physics in the University (at the Imperial College of Science and Technology) conferred on Dr. H. Elliot, 466
  Title of professor of organic chemistry in the University (at Queen Mary College) conferred on Dr. W. J. Hickinbottom, 466

Title of professor emeritus in the University conferred on Prof. T. J. Bosworth (veterinary pathology), Prof. E S. Pearson (statistics), Prof. Dorothy S. Russell (morbid anatomy), Prof. W. Smith (bacteriology), and Prof E. E. Turner (chemistry), 466
Appointment of Prof E. T. C. Spooner as dean of the London School of Hygiene and Tropical Medicine, 466
Grant of £50 from the Gulbenkian Foundation to the Wye College Exploration Society's expedition to Morocco, 558
Appointment of Dr. Richard Creese to the readership in physiology at St. Mary's Hospital Medical School, 743
Appointment of Dr. L M. Jackman to the University readership in organic chemistry at the Imperial College of Science and Technology, 743
Grants to the Imperial College of Science and Technology for Space Research—£7,275 to Dr. H E Elliot (for satellite measurements of the primary cosmic-ray energy spectrum), and £1,500 to Dr. H. E. Elliot (for an investigation into cosmic-ray intensity variations at rocket altitudes); and £7,935 to Dr S. H Hall (for geomagnetic field measurements in the Earth's upper atmosphere), 744
Grants to Dr. R. L. F. Boyd, University College, London, for Space Research—£8,880 (for the development and use of photoelectric satellite tracking equipment, and £35,450 (for rocket research in the upper atmosphere of (1) atmospheric temperature, density and winds, (2) ionospheric temperature, density and composition, (3) short-wave-length solar radiation, and (4) stellar ultra-violet light), 744
Appointment of G. Belyavin to the University chair of bacteriology at University College Hospital Medical School, 904
Appointment of E. J. Ambrose to the University readership in physical chemistry at the Institute of Cancer Research, Royal Cancer Hospital, 904
Appointment of Dr. F. A. Holton to the University readership in veterinary biochemistry at the Royal Veterinary College, 904
Title of reader in chemistry (at the Institute of Cancer Research, Royal Cancer Hospital) conferred on G M Timmis, 904
Title of reader in mechanical engineering (at Queen Mary College) conferred on Dr. C. R. Webb, 904
University of London Institute of Psychiatry: Appointment of Dr. M. Shepherd as reader in psychiatry, 117
University of Manchester: Summer School in Modern Methods of Crystal Structure Determination, on behalf of the Department of Physics of the Manchester College of Science and Technology, 201
Course of lectures at the Manchester College of Science and Technology on Problems of Radioactivity at Water and Sewage Works, 743
Grants for Space Research—£15,277 to Dr. R C Jennison (for micrometeorite investigations from an Earth satellite), £15,020 to Dr. R. C Jennison (for low-frequency radio astronomy from an Earth satellite), and £2,500 to Prof. A C. B. Lovell (for the tracking of satellites and space probes), 744
University of Melbourne: Honorary degree of Doctor of Laws conferred on Sir Alexander Todd, 1081
University of Nottingham · Proceedings of the Sixth Easter School in Agricultural Science, 1959 (The Measurement of Grassland Productivity), (edited by Prof. J. D. Ivins), review by Dr. G. W. Cooke, 544
Election of Prof. A. G. Smith as first holder of the Hives chair of thermodynamics, 743
Proceedings of the Fifth Easter School in Agricultural Science, 1958 (Nutrition of the Legumes), (edited by Prof E. G. Hallsworth), *review* by Prof. Walter Stiles, 815
University of Oxford · Mullard Cryomagnetics Laboratory, 25
New Laboratory of the Department of Metallurgy, 105
Appointment of D. F W. Baden-Powell as lecturer in prehistoric archaeology, 117
Appointment of Dr M. J. Kearsley as lecturer in mathematics, 117
Appointment of Dr. H. R. Harré as lecturer in the philosophy of science, 117
Non-residential Summer School on Numerical Analysis, 374
Grant of £250 from the Gulbenkian Foundation towards the expedition to the Peruvian Andes, 558
Grant of £140 from the Gulbenkian Foundation to the Oxford Women's expedition to the Azores, 558
Grant of £100 from the Gulbenkian Foundation to the expedition to Cyrenaica, 558
Grant of £10,000 from the Gulbenkian Foundation to the Institute of Education, 558
Grant of £4,560 to Dr. J T Houghton for Space Research (for the development of photoconductive material for satellite measurements of infra-red radiation), 744
Appointment of Dr. Graham Higman to the Waynflete chair of pure mathematics, 830
University of Peshawar: Appointment of Dr. N E. Odell to the chair of geology, 905
University of Pittsburgh: Appointment of Dr. Theodore Holstein as professor of physics, 905
Appointment of Dr. Robert L. Wolke as associate professor of chemistry, 905
Appointment of Dr. David S. Feingold as assistant professor of bacteriology, 905
Appointment of Dr. Robert Silverman as assistant professor of mathematics, 905
University of Reading: Report for 1959 of the Museum of English Rural Life, 26
Report of the National Institute for Research in Dairying (1959), 909
University of St. Andrews Appointment of Dr J. A. Macdonald as professor of botany, 1075
University of Sheffield. Special Report No. 64, Precipitation Processes in Steels—Report of a Conference organized by the Department of Metallurgy, 1958, *review* by Prof. F. C. Thompson, 9
Appointment of R. K. Kelsall to the newly created chair of sociological studies, 463
Appointment of F. W. G. Warren as lecturer in applied mathematics, 466
Appointment of Dr. D N Jones and Dr. R. N. Dixon as lecturers in chemistry, 466
Appointment of Dr. J. M. West as lecturer in metallurgy, 466
University of Southampton: Contribution of £5,000 from the Ford Motor Co, Ltd, to the 1962 Centenary Appeal Fund, 290
Title of reader in history conferred on A T. Patterson, 290
Title of reader in mathematics conferred on Dr W H. Cockcroft, 290
Appointment of H. C. Tottenham to the readership in structural engineering, 290
Appointment of H. S. Allen as lecturer in civil engineering, 290
Appointment of C. H. B. Mee as assistant lecturer in physics, 290
Contribution of £17,500 to the Centenary Appeal Fund from the Westland Aircraft, Ltd, for a readership in helicopter engineering, 743
Grant of £2,150 per annum (for three years in the first place) from Union Carbide, Ltd., to provide for a research fellowship and a research studentship in the Department of Chemistry, 743
University of Sydney: New Chemical Laboratories in the (Prof. R. J. W. Le Fevre), 833
Degree of D Sc., *honoris causa*, conferred on Sir Robert Robinson, 1081
University of Wales: Appointment of Dr. S. P Hutton as professor of mechanical engineering in the University College of South Wales, Cardiff, 117, 555
Appointment of I G. Evans as lecturer in pure mathematics at University College, Swansea, 117
Appointment of Dr H. T. Miles as lecturer in physics at University College, Swansea, 117
Appointment of Dr. J. A. Schofield as lecturer in organic chemistry at University College, Swansea, 117
Appointment of Dr S K. Zaremba as senior lecturer in pure mathematics at University College, Swansea, 117
Appointment of Dr. D. R Davies to the newly created chair of applied mathematics in the University College of North Wales, Bangor, 197
Grant of £16,530 to Prof W. J G Beynon, University College of Wales, Aberystwyth, for Space Research (measurement of electron density/height profiles with rockets using the Doppler method and the pulse method), 744
University (Agricultural): India's First, 556
University College, London: Title of professor of physics in the University of London conferred on Dr. E. H. S Burhop, 201
Appointment of A. F. Huxley as Jodrell professor of physiology, 371
Seminar on Colloid and Polymer Science, 378
Appointment of Dr. J. Hamilton to the second chair of physics, 466, 555
Grants to Dr R. L. F. Boyd for Space Research—£8,880 (for the development and use of photoelectric satellite tracking equipment, and £35,450 (for rocket research in the upper atmosphere of (1) atmospheric temperature, density and winds, (2) ionospheric temperature, density and composition, (3) short-wave-length solar radiation, and (4) stellar ultra-violet light), 744
University College of North Wales, Bangor: Appointment of Dr D. R. Davies to the newly created chair of applied mathematics, 197
University College of South Wales and Monmouthshire, Cardiff: Appointment of Dr. S. P. Hutton as professor of mechanical engineering, 117, 555
University College, Swansea: Appointment of I G Evans as lecturer in pure mathematics, 117
Appointment of Dr H T. Miles as lecturer in physics, 117
Appointment of Dr. J. A. Schofield as lecturer in organic chemistry, 117
Appointment of Dr. S K Zaremba as senior lecturer in pure mathematics, 117
University College of Wales, Aberystwyth Grant of £16,530 to Prof. W J. G Beynon for Space Research (measurement of electron density/height profiles with rockets using the Doppler method and the pulse method), 744
University College of the West Indies: Imperial College of Tropical Agriculture to be merged into the, 374
University College Hospital Medical School: Appointment of G. Belyavin to the University of London chair of bacteriology, 904
University Corporation on Atmospheric Research. Grant of 500,000 dollars from the United States National Science Foundation, to assist in establishing the United States National Centre of Atmospheric Research, 200
University Education: The Place of Physiology in (Prof. J. A. B Gray), 719
University Education in Britain, 719
University Education in New Zealand (Prof. W. J. Chapman), 107
University Students (South African). Daily Food Consumption by (Sonia E. Walker), 381
Unproductivity in the Colchicine-induced Tetraploids of *Annona squamosa*. L. (Prof. Ahmad Shamsul Islam), 343
Upper Atmosphere Wind: Effect of, on the Rotation of Satellite 1958δ1 (Dr C R. Faulkner), 926
Upper-Atmosphere Wind Studies by *Skylark* Rocket Sodium Experiment (Dr G V Groves), 1001
Uptake of Heparin by Cells (Dr. G Csaba and Dr Eszter Kapa), 711
Uptake of Thymidine and Synthesis of Deoxyribonucleic Acid in Mouse Ascites Cells (Dr A. R. Crathorn and Dr K. V. Shooter), 614
Uranium in the Periodic Table. Positions of Thorium and (Dr. A. E. Dwight), 505
Uranium, Thorium, Plutonium, Neptunium: Crystal Chemistry of Simple Compounds of (E. S Makarov), translated from the Russian by E. B. Uvarov, *review* by Dr. L. E J Roberts, 728
Urbański, Prof T.: Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079
Urbański, Prof. T., and others Antineoplastic Activity of Tetrahydro-1,3-oxazine Derivatives, 426
Urea—Ammonium Bromide: Mimetic Twinning in (C. G. C. Cateby), 765
Urea—Lithium Bromide Solutions: Viscosity of Concentrated (Dr. Irving I. Geschwind), 324
Uretz, Prof. Robert B. (Freifelder, Dr David, and): Dye-sensitized Photoreactivation of X-Ray Damage in Diploid Yeast, 953
Urey, Prof H. C.: Origin of Tektites, 855
Uri, Dr N. · Some Aspects of Autoxidation, 746
Physico-chemical, Biological and Applied Aspects of Autoxidation (Initiation Phase in the Aerobic Oxidation of Linoleic Acid and its Esters), 746
Uric Acid (Blood), in Five Species of Birds Variability in Levels of (Jack W Hudson and Charles R. Taylor), 788

Urinary Amino-Acid Pattern of Cats on Diets of varying Protein Content (Dr. J. P. Greaves and Dr. Patricia P. Scott), 242

Urinary Excretion of β-Amino-isobutyric Acid after Injection of Thymidine labelled with Tritium (Dr. Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 956

Urinary Excretion of Œstrogens in Cases of Chronic Prostato-vesiculitis (Prof. Gunnar Nylander), 154

Urine of Cattle: Occurrence of Keto-Acids in Blood Serum and, in comparison with Man, Horse, Sheep and Dog (Dr. C. J. G. van der Horst), 146

Urine (Normal): The Plasma Proteins in (Dr. I. Berggård), 776

Ursin, Dr. Erik: A Quantitative Investigation of the Echinoderm Fauna of the Central North Sea (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 24), *review* by Dr. A. J. Southward, 360

Use of Azo Dyestuffs for the Polarographic Determination of the Lanthanides (T. M. Florence and L. E. Smythe), 771

Use of Case Studies: Research Necessary for the Preparation and (South London Committee of the British Institute of Management Conference on), 660

Use of Collagenase in the Characterization of Pseudocoelomic Membranes of *Ascaris lumbricoides* (Barbara Dawson), 798

Use of Dieldrin in the Control of *Glossina palpalis* (R-D) in Nigeria (J. B. Davies), 84

Use of Diodone in Renal Studies in Sheep (B. J. Potter), 698

Use of Electronic Computers: Research in the (Unesco Fellowships for), 465

Use of Ferritin-conjugated Antibody to Localize Antigen by Electron Microscopy (Richard A. Rifkind, Konrad C. Hsu, Councilman Morgan, Beatrice C. Seegal, Alice W. Knox and Harry M. Rose), 1094

Use of Gamma-Radiation Sources for the Sterilization of Pharmaceutical Products (Report of the Association of the British Pharmaceutical Industry), 903

Use of Measuring Instruments: Chemical Plant Instrumentation—some Notes on the (Association of British Chemical Manufacturers), 1079

Use of Reflectance Measurements in assessing the Colour Changes of Ageing Bloodstains (Dr. D. Patterson), 688

Use of Stereographic Projection in Structural Geology (Dr. F. C. Phillips), second edition, *review* by John Sutton, 729

Use of Toxic Chemicals in Agriculture and Food Storage (Request from the Research Study Group for evidence), 290

Uses (Industrial), of Radioisotopes (United Kingdom Atomic Energy Authority Course for Trade Union Officials), 905

U.S.S.R.: Automatic Programming in the, *review* by R. J. Ord Smith, 92
Health Services in the (United Nations, World Health Organization, Public Health Papers No. 3), 379
Nuclear Research in the, *review* by Dr. S. C. Curran, 630
Polar Research in the, 287
The Proterozoic in the, 742

U.S.S.R.—Great Britain Society and the Moscow Physiological Society: Joint Meeting to celebrate the centenary of the births of W. M. Bayliss and J. S. Haldane, 912

Utilization of Nitrogen and its Compounds by Plants—Symposia of the Society for Experimental Biology, No. 13 (edited by H. K. Porter), *review* by Prof. Walter Stiles, 815

Uvarov, Dr. B. P.: Problems of the Arid Zones (Development of Arid Lands and its Ecological Effect on the Insect Fauna), 295

VACCINATION against Whooping Cough, Diphtheria and Tetanus (Research Defence Society, *Conquest* Pamphlet No. 11), 649

Vacek, Dr. A.: Role of Initial Value of Metabolic Processes in Oxygen Consumption Changes in Rats during Irradiation, 76

Vacek, Dr. A. (Strmiska, Dr. Jaroslav, and): Effect of Electronarcosis on Oxygen Consumption and Carbon Dioxide Output, 151

Vacuolar System in Cells of *Agrobacterium tumefaciens* as shown by Electron Microscopy of Ultra-thin Sections (Miguel Rubio-Huertos and Paul R. Desjardins), 1043

Vacuoles: A Method for the Isolation of Plant Protoplasts and (Dr. E. C. Cocking), 962

Vacuum Systems (Demountable): Direct Observation of Surface Contamination formed in (D. E. Bradley), 227

Vacuums (Higher): Pump Fluids for (Kenneth Hickman), 405

Vainio, T., and others: Protection against Liver Injury due to Murine Hepatitis Virus, 507

Valence-Bond Structures—a New Proposal (Dr. J. W. Linnett), 859

Value (Historical): Preservation of Films of, 199

Value (Initial), of Metabolic Processes: Role of, in Oxygen Consumption Changes in Rats during Irradiation (Dr. A. Vacek), 76

Values (Glucosamine), of Muramic Acid and other Amino-Sugars by the Elson and Morgan Method (R. E. Strange), 38

Values (Nutritive), of Carbohydrates for the Silkworm, *Bombyx mori* (Dr. Toshio Ito), 527

Van, T. K.: Secondary Selection in Pure Lines of Rice, 169

Van Adrichem, M. E., and others: Structures of some Acetyl-serine Peptides from Acetyl-chymotrypsin, 596

van Dijk, H., and others: The Helium-4 Scale of Temperature, 1077

van der Wiel, Dr. A.: Two Highly Selective Solvents for Gas-Liquid Chromatography Analysis of C_1–C_4 Hydrocarbons, 142

van der Zweep, Dr. W.: Herbicides and the Soil (Practical Use of Herbicides in relation to their Persistence in the Soil), 377

Vanek, Dr. J., and Stelzner, J.: Oscillatory Character of Amplitude Curves for Seismic Body Waves, 491

Vaporization: A Relation between Ultrasonic Velocity and Latent Heat of (Prof. B. Ramachandra Rao and P. R. K. L. Padmini), 311

Vaporization of Sulphides: Mass Spectrometric Investigation of the, and the Dissociation Energy of Se_2 (R. Colin, Prof. P. Goldfinger and M. Jeunehomme), 408

Vapour-Phase Polymerization of Methyl Acrylate: Generation of Aerosols by (R. Pearson and G. Langer), 235

Vapour (Water) Content of the Air: Average (J. K. Bannon and L. P. Steele), 748

Variability in Levels of Blood Uric Acid in Five Species of Birds (Jack W. Hudson and Charles R. Taylor), 788

Variances (Population) may be Unequal: Significance of the Difference between Two Means when the (John B. de V. Weir), 438

Variant (A Bleached), of *Euglena gracilis* showing a Doubling of the Content of Deoxyribonucleic Acid (Dr. George Brawerman, Carole A. Rebman and Prof. Erwin Chargaff), 1036

Variation (Continuous): Genetics of, *review* by Prof. Kenneth Mather, 813

Variation (Diurnal), of Cosmic Rays: Dependence on Latitude of the Amplitude of the (Arne Eld Sandström, Eric Dyring and Stig Lindgren), 1099

Variation (Latitudinal), of Frost-point Temperature and Wind: Airborne Measurements of (N. C. Helliwell), 993

Variations in Temperature: Effect of, on Meiosis in *Gagea reticulata* Schultes (Dr. C. P. Malik), 805

Varieties (Seedless and Seeded), of *Vitis vinifera*: Toxicity of Gibberellin to (Dr. Robert J. Weaver), 1135

Vascular Muscle: Effect of the Cations of the Lyotropic Series on the Tension of (Prof. L. Laszt), 329

Vasil, Dr. I. K.: Pollen Germination in some Gramineae—*Pennisetum typhoideum*, 1134

Vasoconstrictor Amines: Influence on the Effect of, by Pretreatment with Reserpine (H. C. Sabelli), 784

Vasotocin (Arginine): Evidence for the Identity of Natriferin, the Frog Water-Balance Principle and (Prof. Wilbur H. Sawyer), 1030

Vector Space and its Application in Crystal-Structure Investigation (Prof. Martin J. Buerger), *review* by Dr. J. W. Jeffery, 975

Végétaux (Tissus): La Culture des (Prof. R. J. Gautheret), *review* by A. Allsopp, 976

Vehling, A. (edited by): Penetration of Charged Particles in Matter—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1958 (United States National Academy of Sciences—National Research Council, Nuclear Science Series, Report No. 29), 1086

Velocities (Ultrasonic), in Aqueous Electrolyte Solutions (Dr. C. G. Balachandran), 136

Velocity of Conduction and Spinal Transmission of Proprioceptive Hind-Limb Reflexes (Hind-Limb Reflexes in the Kitten), (Dr. Sten Skoglund), 132

Velocity (Ultra-sonic), and Latent Heat of Vaporization: A Relation between (Prof. B. Ramachandra Rao and P. R. K. L. Padmini), 311

Venkata Ram, Dr. C. S.: Foliar Application of Nutrients and Rhizosphere Microflora of *Camellia sinensis*, 621

Venkataraman, Prof. K.: Elected a member of the Chemistry section of the Leopoldina Academy of Natural Sciences, 1079

Venom (*Bothrops jararaca*): Bradykinin-releasing Factor from (Dr. Olga B. Henriques, Mina Fichman and W. T. Beraldo), 414

Vent-Axia Insect Suction Traps, 559

Vertebrates: Classification of the Cestodes of, *review* by Dr. Ben Dawes, 723

Ventricle (Lateral), of the Rat: Hunger Reduction produced by Injecting Glucose into the (L. J. Herberg), 245

Ventricle (Rat's): Effect of Nitrate Ion on the Distribution of Sucrose in the (S. T. Taketa, C. G. Alexander and Prof. G. A. Feigen), 419

Ventricles (Heart): Platelet-Count Differences in Blood of the Rabbit Right and Left (Dr. J. George Sharnoff and Dr. Vito Scardino), 334

Venus: The Transits of—a Study of Eighteenth-Century Science (Prof. Harry Woolf), *review* by Dr. David S. Evans, 636

Verdier, Dr. E. T.: Science and Technology in Africa South of the Sahara, 198

Verhoogen, Prof. J. (Fyfe, Prof. W. S., and): Covalent Super-Exchange in Solid State Physics, 1108

Vermiculite (Clay Minerals, Montmorillonite and): Aluminium Interlayers in—Laboratory Synthesis (B. L. Sawhney), 261

Vermiculite Crystals in Water: Macroscopic Swelling of (G. F. Walker), 312

Vero, Lidia, and others: Production of Lysergic Acid Derivatives by a Strain of *Claviceps paspali* Stevens and Hall in Submerged Culture, 238

Veronese, Vittorino: Problems of the Arid Zones, 295

Vertebrate Morphology: A Manual of Practical (J. T. Saunders and Dr. S. M. Manton), third edition, *review* by Dr. N. B. Marshall, 9

Very Low-Frequency Hiss observed at Byrd Station, Antarctica: Association between Aurorae and (Dr. L. H. Martin, Dr. R. A. Helliwell and K. R. Marks), 751

Veterinary College (Royal), London: Appointment of Jennifer Remfry as Junior Universities Federation for Animal Welfare (UFAW) Research Fellow, to assist Dr. Phyllis G. Croft in research relating to anaesthetics and relaxants, 743
Appointment of Dr. F. A. Holton to the University of London readership in veterinary biochemistry, 904

Veterinary Medicine : Human and (Dr W. J. Hayes, Jr., Dr. S W. Simmons and Dr. E. F. Knipling), (edited by Dr. S. W. Simmons), (DDT—the Insecticide DDT and its Significance, edited by Paul Müller, Vol. 2), *review* by Prof. D. S. Bertram, 271
Veterinary Science : Advances in (edited by C. A. Brandly and E L. Jungherr), Vol. 5, *review* by Prof. H Burrow, 448
Veterinary Zoology (Medical and) : Index-Catalogue of (United States Department of Agriculture), Supplements 9 and 10, 559
VHF Bands (UHF and) : Television Field Trials of 405-Line and 625-Line Systems in the, 1957-1958 (British Broadcasting Corporation), 288
Viability and Germination Inhibitor of the Seed of Rice (Prof. S M. Sircar and Manjula Biswas), 620
Vicia faba : Radiation Biology of, in relation to the General Problem (Dr. John Read), *review*, 8
Vick, Dr. F. A. : Appointed director of the Atomic Energy Research Establishment, 556
Victoria (Lake) : Breeding Sites of Non-Cichlid Fishes in (Dr. Philip S Corbet), 616
Viewing of 'Thorotrast' in Tissue Sections : Combined Oil-immersion, Phase-contrast and Dark-ground (Dr. E. W. Baxter), 162
Vilček, Dr. J. : An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected Chick Embryo Fibroblast Cells, 73
Vines (Grape), in Europe and North America : Sap-Transmissible Viruses associated with Diseases of (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
Vinograd, Dr. Jerome, and Hutchinson, William D. : Carbon-14-Labelled Hybrids of Haemoglobin, 216
Vinogradov, A. P. : The Geochemistry of Rare and Dispersed Chemical Elements in Soils, (translated from the Russian), second edition, *review* by A. H. Debnam, 629
Virág, Dr. S., and others : Role of Mucoid Substances of the Aorta in the Deposition of Lipids, 152
Virial Coefficient (The Second), of Methane at Low Temperature (G. Thomaes and R. Van Steenwinkel), 229
Virtanen, Prof. A. I. : Elected an honorary member of the American Institute of Nutrition, 374
Virus of Tick-borne Encephalitis : Virus and Antibodies in the Lymph and Blood of Sheep infected experimentally with the (Doubravka Málková), 716
Virus (Cucumber Mosaic), Infection Process : Direct Infra-Red Spectral Analysis of the (Prof. G. W. Cochran, G. W. Welkie and J. L Chidester), 1049
Virus (Influenza) propagated in De-embryonated Eggs · Physical Incompleteness of (Martin Hanig and Joseph M. Stern), 40
Virus (Murine Hepatitis) · Protection against Liver Injury due to (Dr J. D. Judah, G. Bjotvedt and T. Vainio), 507
Virus (Plant) : Activation of One, by Another (B. Kassanis and H. L. Nixon), 713
Virus (Polyoma) : Production of Tumours in *Rattus (Mastomys) natalensis* by (Dr. Alan S. Rabson, William J. Branigan and Frances Y. Legallais), 423
Virus (Polyoma) Mutant with a Reduction in Tumour Formation (Dr. Leo Sachs and Dan Medina), 715
Virus (Tobacco Mosaic) : Polyphenol Oxidase Activity of *Nicotiana glutinosa* Leaves infected with (Dr. Masatake Kikuchi and Akira Yamaguchi), 1048
Virus (Tumour-destroying) · Isolation of a Non-pathogenic, from Mouse Ascites (Dr. J. G Bennette), 72
Virus-infected Plants : Possible Occurrence of Interference Systems in (A. D. Thomson), 761
Virus-infected (Encephalitis) Chick Embryo Fibroblast Cells : An Interferon-like Substance released from Tick-borne (Dr. J. Vilček), 73
Virus Protein (Tobacco Mosaic) : A Difference between the Sub-Units of ? (Dr. H. G. Aach), 75
Virus-Streak Disease of Tomatoes (B. H. MacNeill and Hikmet Ismen), 903
Virus and Antibodies in the Lymph and Blood of Sheep infected experimentally with the Virus of Tick-borne Encephalitis (Doubravka Málková), 716
Viruses of Talfan and Teschen Diseases : Infective Ribonucleic Acid from the (F. Brown and Doreen L. Stewart), 714
Viruses (Plant) . Freeze-drying of (M. Hollings and R. A. Lelliot), 1078
Viruses (Sap-Transmissible), associated with Diseases of Grape Vines in Europe and North America (C. H. Cadman, H. F. Dias and B. D. Harrison), 577
Visco-elastic Behaviour of Blood Vessels of the Muscular Type (V. Hardung and Prof. L. Laszt), 330
Viscosity of Concentrated Urea—Lithium Bromide Solutions (Dr Irving I. Geschwind), 324
Viscosity Increments on Non-ionized Molecules (Alfred Polson), 482
Viscous (*Bo*) Flow Coefficients of Permeable Solids : Measurement of Slip (*Ko*) and (J. G. Biram), 865
Visible Light : Absorption of Ultra-violet and, by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal (Sabri Ergun, J. T. McCartney and R E Walline), 1014
Visser, A. (compiled and arranged on an English alphabetical base by) . Elsevier's Telecommunication Dictionary in Six Languages—English/American, French, Spanish, Italian, German, Dutch, *review* by Dr R. L. Smith-Rose, 1059
Visual Acuity Effect of Size of Pupil on (Dr. F. W. Campbell and Dr A. H. Gregory), 1121
Visual Discrimination . Problems of (Prof. R. W. Ditchburn), 854
Vitamin B_{12} (Dr. E. Lester Smith), *review* by Prof. John Yudkin, 889
Vitamin and Coenzyme Content of Hepatomas induced by Butter Yellow (M. H. Briggs), 249
Vitis vinifera · Toxicity of Gibberellin to Seedless and Seeded Varieties of (Dr. Robert J. Weaver), 1135
Vitrinite from a High-volatile Bituminous Coal : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
Vocational Education (Technical and), in the U.S.A —a Bibliographical Survey prepared by the United States Office of Education (Unesco, Educational Studies and Documents No. 36), 741
Volatile (High-) Bituminous Coal : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a (Sabri Ergun, J. T. McCartney and R. E. Walline), 1014
von Engel, Dr. A , and Arnold, Dr. K. W. : Stepwise Ablation and Heat Transfer in Cold-Cathode Arcs, 1101
von Humboldt, Alexander, et Bonpland, A : Géographie des Plantes, facsimile edition (Society for the Bibliography of Natural History), 904
von Kármán, Prof Theodore : Opening Address at the AGARD fourth Colloquium on Combustion and Propulsion (High Mach Number Air-breathing Engines), 18
von Laue, Prof. Max : *Obituary* by Dr. P. Rosbaud, 738, *erratum*, 905
von Maltzahn, Prof. Kraft E , and MacNutt, Mary M. : Intracellular Configuration and Dedifferentiation in *Splachnum ampullaceum* (L.) Hedw., 344
von der Decken, A., and Hultin, T. : Cytoplasmic Particles and their Role in Protein Synthesis, 645
Vorbeck, Marie L., and others : Determination of Fatty Acids of Lower Molecular Weight by Gas Chromatography, 689
Vronsky, B. I. : Fossil Meteorites, 648
The Tunguska Meteorite, 1078

WADDINGTON, Prof. C. H. : Embryos of Birds, *review*, 814
Wadsley, Dr. A. D. (Andersson, Dr. Sten, and) : Five Co-ordinated Titanium in $K_2Ti_4O_9$, 499
Wain, J. : Awarded a Nature Conservancy Research Studentship for post-graduate training in Ecology (Geography), 742
Wales : Nature Conservancy in, 464
Wales (South) · Relic-Soil on Limestone in (D. F. Ball), 497
Walford, Dr. A. J. (edited by, with the assistance of L. M. Payne) : Guide to Reference Material, *review* by R. Brightman, 273
Walker, Dr. D. G. : Appointed a lecturer in biochemistry at the University of Birmingham, 117
Walker, G. F. : Macroscopic Swelling of Vermiculite Crystals in Water, 312
Walker, Dr. J. : Optical Rotatory Powers of Alkaloids, *review*, 7
Walker, Dr. P. M. B. : Grant of £3,230 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of a high-speed integrating microspectrophotometer, 291
Walker, Sonia E. : Daily Food Consumption by South African University Students, 381
Walker, Prof. T. W. : Rothamsted Experimental Station, 661
Wallen, Dr. C. C. : Problems of the Arid Zones (Climatology, including Hydro-meteorology), 295
Walline, R. E., and others : Absorption of Ultra-violet and Visible Light by Ultra-thin Sections of Vitrinite from a High-volatile Bituminous Coal, 1014
Walshaw, C. D., and others : Pure Rotational Absorption of Ozone in the Region 125-500 Microns, 765
Walton, A. J. : Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Wangersky, P. T., and others : Oceanography of Long Island Sound, 123
Ward, Prof. A. G. : The Present Position of Leather Science, *review*, 724
Traité Général de la Fabrication des Colles des Glutinants et Matières d'Apprêts, *review*, 890
Ward, Dr. A. H., and Marr, J. D. : Radioactive Fall-out in Ghana, 299
Ward, Henry Baldwin, and Whipple, George Chandler : Fresh-Water Biology, second edition, edited by Prof. W. T. Edmondson, *review* by Dr. T. T. Macan, 6
Ward, J. F., and others : Chemical Effects of Ionizing Radiations on Nucleic Acids and Nucleoproteins, 319
Ward, Prof. S. G. : Safety in Mines Research Establishment Bibliography, 1960, *review*, 1063
Wardlaw, J. (Alexander, K. M , and) : Dependence of Cement-Aggregate Bond-Strength on Size of Aggregate, 230
Ware, C. C., and others : Effect of some Aromatic Hydroxy Compounds on the Phagocytic Activity of the Reticulo-Endothelial System, 422
Effect of Three Compounds related to Diethylstilboestrol on the Phagocytic Activity of the Reticulo-Endothelial System, 1032
Ware, Dr. G. C. : Biology of Pollution, *review*, 1061
Warfield, R. W , and Petree, M. C. : Dependence on Temperature of the Electrical Resistivity of Thermosetting Polymers, 316
Wark, Dr. D. C., and others : Differentiation in *Peronospora tabacina* Adam , 710
Warner, N. L. (Burnet, Sir Macfarlane, and) Assay of Corticosteroids in the Chick Embryo, 938
Warner Memorial Medal of the Textile Institute awarded to Prof. C. S. Whewell, 201
Warren, F. W. G. : Appointed lecturer in applied mathematics at the University of Sheffield, 466
Warren Spring Laboratory : Report for 1959, 1082
Wase, Prof. Arthur W., and Feng, Dr. Yu Sheng Louise · Sialoadenectomy and the Distribution of Thyrotrophin labelled with Iodine-131, 778
Washington, Elmer L. (Mangelsdorf, jun , Prof. Paul C., and) · Packing of Mixtures of Hard Spheres, 930
Wassermann, Dr. A. (Blakely, C. F., and) : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Kinetics and Mechanism, 662
Wassermann, Dr. A , and others : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy, 662
Water : Growing Demand for (Second Report of the Sub-Committee of the Central Advisory Water Committee), 198
Infra-red Examination of the Association of Cornea Proteins with (Dr. S. Bakerman and C. Mitchell), 1033
Infra-Red Spectra of Amino-Acids and related Substances in (Prof Frank S. Parker and Prof Donald M. Kirschenbaum), 386
Interaction of Picric Acid with Sodium Hydroxide in (Takehiro Abe), 234
Macroscopic Swelling of Vermiculite Crystals in (G. F. Walker), 312
Water (Brackish) Areas : The Oligochaete Fauna of Three Danish (Ingerlise Dahl), (Meddelelser fra Danmarks Fiskeri- og Havundersøgelser, Ny Serie, Bind 2, Nr. 26), *review* by Dr. A J. Southward, 360
Water (Fresh-) Biology (Henry Baldwin Ward and George Chandler Whipple), second edition, edited by Prof. W. T. Edmondson, *review* by Dr. T. T. Macan, 6
Water (Fresh-) Biology : North American, *review* by Dr. T. T. Macan, 6

Water (Heavy) : Effect of, on Respiratory-chain Enzymes (Dr. H Laser and Prof. E. C. Slater), 1115
  Effects of Linear Energy Transfer on the Radiolysis of Water and (Dr. E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Water (Mitochondrial and Cell) : Phosphoproteins and (Dr. J. D. Judah), 506
Water (Pure) : Changes in Conductivity of, caused by X-Irradiation (K. Schmidt), 931
Water (Sea-) : Alleged Occurrence of the Perchlorate Ion in (R. Greenhalgh and Dr. J P. Riley), 1107
Water (Surface Sea), off the California Coast (1959-60) : Fall-out Caesium In, by Gamma-Ray Measurements (Dr. Theodore R. Folsom, Dr. G. J Mohanrao and Perrin Winchell), 480
Water-Balance Principle (Frof), and Arginine Vasotocin : Evidence for the Identity of Natriferin, the (Prof Wilbur H Sawyer), 1030
Water Board, Metropolitan . Thirty-eighth Report on the Results of the Bacteriological, Chemical and Biological Examination of the London Waters for the Years 1957-1958 (E. Windle Taylor), 468
Water Committee, Central Advisory : Second Report of the Sub-Committee on Growing Demand for Water, 198
Water Evaporation : New Compounds for the Control of (A. V. Deo, N R. Sanjana, S. B. Kulkarni, M. K. Gharpurey and A. B. Biswas), 870
Water Relations (Plant- and Soil-) : Terminology In (Dr. R. O. Slatyer and Prof. S. A. Taylor), 922
Water Resources in the United States (Prof. W. G. V. Balchin), 562
'Water Rigour' as an Aid when Operating on Marine Gastropoda (Prof B. J. Krijgsman and A. C. Brown), 69
Water Solutions (Highly Enriched Oxygen-18), containing Hydrogen Peroxide-16,16 : Radiolysis of (Dr. Michael Anbar, Shmuel Guttmann and Prof. Gabriel Stein), 57
Water Vapour Content of the Air : Average (J. K. Bannon and L. P. Steele), 748
Water and Heavy Water : Effects of Linear Energy Transfer on the Radiolysis of (Dr E. Collinson, Prof. F. S. Dainton and J. Kroh), 475
Water and Sewage Works : Problems of Radioactivity at (Manchester College of Science and Technology Course of Lectures on), 743
Water and Solutes : Plants in relation to (Plant Physiology, edited by F. C. Steward, Vol 2), *review* by Prof. Walter Stiles, 889
Water-soluble, Non-fibrous Deoxyribonucleoprotein from Calf Thymus Nuclei (Dr. Richard S. Welsh), 943
Waters (Offshore), of the Sierra Leone River : Plankton of the Estuary and (V. Bainbridge), 557
Waters (Polluted) : The Biology of (Dr. H. B. N. Hynes), *review* by Dr. G. C. Ware, 1061
Watkins, Sidney B. (edited by Herbert W. Cremer and) : Chemical Engineering Practice, Vol. 11, Works Design, etc., *review* by Prof. J. M. Coulson, 887
Watson, Dr. D. G. : Awarded a Glasgow fellowship by the Ramsay Memorial Fellowship Trustees, 832
Watson, Dr. J. D. : Elected to an Overseas Fellowship of Churchill College, Cambridge, 742
Watson, Dr. J. M. : Medical Helminthology, *review* by Dr. G. Lapage, 815
Watson, Dr. W. F. : Rubber Technology, *review*, 359
Watton, E. C. (Graddon, Dr. D. P., and) : Structure of the 1:1-Adducts of Cupric β-Diketone Chelates with Heterocyclic Bases, 1021
Wave Approximation (Distorted), for Scattering Phase-Shifts (Dr. P. Swan), 589*
Waveguides : Swedish Supplement to Elsevier's Dictionary of Electronics and (W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1059
Waves (Electromagnetic) : Ionospheric Propagation of, *review* by Sir Harrie Massey, 810
Waves (Electromagnetic Standing), and Ball Lightning (Dr. Lewi Tonks), 1013
Waves (Seismic Body) : Oscillatory Character of Amplitude Curves for (Dr. J. Vanek and J. Stelzner), 491
Wawrzyczek, Dr. Wiktor : *Obituary* of Prof. Tadeusz Milobedzki, 991
Weakness (Muscular), in Rats : Production of, by a Creatine Analogue (Coy D. Fitch and Prof. James S. Dinning), 421
Weapon Debris (Nuclear) : Fractionation of (Prof. C. Sharp Cook, R. L. Mather, R. F. Johnson and F. M. Tomnovec), 1100
Weather Bureau (United States) : World Weather Records, 1941-50. *review* by H. H Lamb, 727
Weather Problems in Agriculture (Royal Meteorological Society Summer Meeting), 995
Weather Records : World, 1941-50 (United States Weather Bureau), *review* by H. H. Lamb, 727
Weather Records of the World, *review* by H. H. Lamb, 727
Weaver, Dr. Robert J. : Toxicity of Gibberellin to Seedless and Seeded Varieties of *Vitis vinifera*, 1135
Weaver Finch, *Quelea quelea* . Effects of Whole-body Irradiation on the Breeding Plumage of the (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
Weaving : New Principle in, 27
Webb, Dr. C. R. : Title of reader in mechanical engineering in the University of London (at Queen Mary College) conferred on, 904
Webb, Prof. J. E. . Appointed to the chair of zoology in Westfield College, London, 362 ; work of, 362
Webb, T. J. B. : Awarded an Overseas Scholarship for 1960 by the Royal Commission for the Exhibition of 1851, 116
Webber, Dr. J. M. : Appointed lecturer in chemistry at the University of Birmingham, 465
Webber, N. B. : Protection against Tidal Flooding In London, 293
Wedgwood, Sir John : At the sixty-sixth Annual Conference of the Museums Association (Relations of Museums and Industry), 657
Weed Control Council (British) : Symposium on Herbicides and the Soil, 376
Wegener, P. P. : Combustion and Propulsion—High Mach Number Air-breathing Engines (Experiments with a Reacting Mixture of Nitrogen Tetroxide and Dioxide carried through a Supersonic Nozzle with a Stream of Nitrogen), 20
Weigle, J., and others : Mutations affecting the Density of Bacteriophage λ, 161
Weill, J., and others : Electronic Equipment used In the Nuclear Energy Industry in France, 1076
Weintraub, Prof. D. : Problems of the Arid Zones (Public Awareness and the Educational Problem—Agriculture-Israel), 296
Weintroub, S. : The Instrument Manual, *review*, 97
  Digest of Literature on Dielectrics, *review*, 728
  Noise in Factories and its Control, 1085
Weir, John B. de V. : Significance of the Difference between Two Means when the Population Variances may be Unequal, 438
Weiskrantz, Dr. L. : Effects of Medial Temporal Lesions on Taste Preference In the Monkey, 679
Weiss, Prof. J., and others : Chemical Effects of Ionizing Radiations on Nucleic Acids and Nucleoproteins, 319
Weiss, Jacqueline B. (Epstein, Dr. Samuel S., and) : Measuring the Size of Isolated Cells, 461
Welch, Dr. Henry, and Finland, Prof. Maxwell (edited by) : Antibiotic Therapy and Staphylococcal Diseases, *review* by Prof. R. Knox, 637
Welfare (Animal), Universities Federation for . Summer Congress, 374
Welkie, G. W., and others : Direct Infra-Red Spectral Analysis of the Cucumber Mosaic Virus Infection Process, 1049
Wellcome Medal for 1959 of the Royal Anthropological Institute awarded jointly to E. M Chilver and Dr. P. Kaberry, 114
Wells, A. F. : Dendritic Growth of Crystals, *review*, 93
Welsh, Dr. Richard S. : Water-soluble, Non-fibrous Deoxyribonucleoprotein from Calf Thymus Nuclei, 943
Welsh Emigration Overseas (Prof. E. G. Bowen), 843
Wendlandt, Prof. Wesley W , and Horton, G. Robert : Differential Thermal Analysis of some Transition Metal Ethylenediamine Tetraacetic Acid Chelates, 769
Wenk, Jun , Edward : Radio Frequency Control In Space Telecommunications, 373
Went, Dr. F. W. : Blue Hazes in the Atmosphere, 641, *erratum*, 994
West, Dr. D. : Method of Observing π-Mesonic X-Rays (Fifteenth Charles Vernon Boys Prize Address to the Physical Society), 853
West, Dr. D. J. : Beyond Science Fiction, *review*, 270
West, Dr. G. B., and others : An Unidentified Pharmacologically Active Substance extracted from Cerebral Hemispheres, 420
West, J. B. (Dollery, C. T., and) : Metabolism of Oxygen-15, 1121
West, Dr. J. M. : Metallic Corrosion, *review*, 182
  Appointed lecturer In metallurgy at the University of Sheffield, 466
West, Dr. T. F. : Appointed editor of *Chemistry and Industry*, 290
West African Religion : Oedipus and Job in (Prof. Meyer Fortes), *review* by Michael Argyle, 96
Westfield College (University of London) : New Faculty of Science, 361
  Appointment of Prof. E. H. Bellamy to the chair of physics, 361
  Appointment of Prof. W. Klyne to the chair of chemistry, 361
  Appointment of Prof. G. E. Fogg to the chair of botany, 362
  Appointment of Prof. J. E. Webb to the chair of zoology, 362
  Appointment of Prof. E. B. Sondheimer to the chair of mathematics, 363
Westland Aircraft, Ltd. : Contribution of £17,500 to the University of Southampton Centenary Appeal Fund, for a readership in helicopter engineering, 743
Wet and Dry Soils : Potash in, *review* by Dr. P. W. Arnold, 976
Wetherill, Dr. G. W. : Age of the Base of the Cambrian, 34
Whale (Humpback), of Known Age : Marked (Dr. R. G. Chittleborough), 164
Whale Feeding Grounds in the Antarctic : Southern Atmospheric Cyclones and the (Dr. C. W. Beklemishev), 530
Wharton, A. L (Brunt, A. A., and): Transmission of a Gall Disease of Cocoa, 80
Wheat Gluten : Effect of, on the Peristaltic Reflex (Dr. R. Schneider, H Bishop, Dr. B Shaw and Prof. A. C. Frazer), 516
Wheat Proteins : Starch-Gel Electrophoresis of (Dr. G. A. H. Elton and J. A. D. Ewart), 600
Wheat Seedling : Plant Hormone Activity—Stilboestrol applied to the (Dr J. J. C. Hinton and Dr. T. Moran), 258
Wheatley, P. J. : The Determination of Molecular Structure, *review* by Dr. J. W. Cook, 812
Wheeler, Sir Mortimer : Early India and Pakistan to Ashoka, *review* by M. C. Burkitt, 94
Whewell, Prof. C. S. : Man-made Fibres, *review*, 2
  Awarded the Warner Memorial Medal of the Textile Institute, 201
Whewell, Prof. C. S., and others : Action of Tetrakis (Hydroxymethyl) Phosphonium Chloride on Wool, 602
Whidden Lectures : Series 4, The Hollow Universe (Prof. Charles de Koninck), *review* by F. I. G. Rawlins, 890
Whipple, George Chandler (Ward, Henry Baldwin, and) : Fresh-Water Biology, second edition, edited by Prof. W. T. Edmondson, *review* by Dr. T. T. Macan, 6
'Whistlers' and 'Chorus' at the South Pole . Observations of (Dr. L. H. Martin), 1018
Whitby, Dr. L. G., and others : Effect of Cocaine on the Disposition of Noradrenaline labelled with Tritium, 604
White, D. A. : Awarded a Nature Conservancy Diploma Course in Conservation and Ecology at University College, London, 742
White, D. J. : Appointed Kenward Memorial Fellow in engineering production at the University of Birmingham, 465
White, Prof. Gilbert : Problems of the Arid Zones (Alternative Uses of Limited Water Supplies), 296
White, Guy K. . Thermal Expansion at Low Temperatures, 927
White, R. F. M., and others : Conversion of Cyclopentadiene into New Bicyclopentyl Derivatives—Structure Determination with the Help of Proton Magnetic Resonance Spectroscopy, 662
White Clover : Biosynthesis of Linamarin and Lotaustralin in (G. W. Butler and Berta G. Butler), 780
White Paper on Assistance from the United Kingdom for Overseas Development, 266
White Paper on Capital Investment in the Coal, Electricity and Gas Industries, 1055
White Paper on Commonwealth Educational Co-operation, 441
White Paper on Defence 1960, 177
White Paper on the proposed International Development Association, 266
White Paper on the Nuclear Power Programme, 1055
Whitear, Dr. Mary : Chordotonal Organs in Crustacea, 522
Whitehead, Dr. J. D. (Heisler, L. H., and) : Longitude Effect in Temperate Zone Sporadic E and the Earth's Magnetic Field, 676
Whitehead, P. J . Interspecific Hybrids of *Tilapia*—*T nigra* x *T. zillii*, 878

Whitmore, Dr. R. L. (Boardman, G., and): Yield Stress exerted on a Body immersed in a Bingham Fluid, 50
Whittaker, J. B.: Awarded a Nature Conservancy Research Studentship for postgraduate training in Ecology (Zoology), 742
Whittembury, G., and others: Effect of Anti-Diuretic Hormone and Calcium on the Equivalent Pore Radius of Kidney Slices from *Necturus*, 699
Whitten, Prof. E. H. Timothy: Average Composition of Granites, the Genesis of Tektites, and Petrogenesis, 867
Whittenbury, R.: Two Types of Catalase-like Activity in Lactic Acid Bacteria, 433, *erratum*, 466
Whitworth, Dr. R. W.: Appointed a lecturer in physics at the University of Birmingham, 117
Whole-body Irradiation: Effects of, on the Breeding Plumage of the Weaver Finch, *Quelea quelea* (Dr. B. Lofts, Prof. A. J. Marshall and Prof. J. Rotblat), 615
  Labilization of Deoxyribonucleic Acid in Thymus Nucleoprotein after (Dr. Ulrich Hagen), 1123
Whooping Cough, Diphtheria and Tetanus: Vaccination against (Research Defence Society, *Conquest* Pamphlet No. 11), 649
Wide, Leif, and others: Immunoelectrophoretic Studies on Purified Human Growth Hormone, 64
Wiener, Prof. Norbert: Nonlinear Problems in Random Theory, *review* by K. Krickeberg, 727
Wigglesworth, Prof. V. B.: Annual Review of Entomology, *review*, 542
  Handbook of Toxicology, *review*, 544
  The Control of Growth and Form—a Study of the Epidermal Cell in an Insect, *review* by Prof. R. Dennell, 631
  The Yellow Fever Mosquito, *review*, 813
Wightman, Dr. William P. D.: *Nullius in verba*, *review*, 356
Wijn, Dr. H. P. J. (Smit, Dr. J., and): Ferrites, *review* by Dr. G. E. Bacon, 974

INTERACTIONS OF SCIENCE AND TECHNOLOGY WITH SOCIETY

In one of a series of lectures on the nineteen-sixties, printed in *The Listener* of March 24, Dr. Alex. Comfort discussed some of the factors which limit the applications of existing scientific knowledge, which determine, for example, whether or not at the end of this decade there will be no untreated cases of leprosy, yaws or malaria in the Commonwealth. The realization of such comparatively modest objectives, which are scientific possibilities and present no unusual difficulties, does not depend on fresh theoretical knowledge, lack of physical resources, or practical difficulties in the field. It depends rather on whether our vast technical resources are allocated to achieve such purposes by those in power, whether in democratic or in totalitarian society. Thus, from a completely different starting point, Dr. Comfort makes essentially the same point that was made by Sir Solly Zuckerman in his address last year on "Liberty in an Age of Science", and by Sir Eric Ashby in his oration at the Conference of European University Rectors and Vice-Chancellors.

Two other recent lectures develop very similar ideas. Mr. E. Le Q. Herbert, in his presidential address, "Chemistry, Industry and Society", to the Royal Institute of Chemistry on April 6, illustrated from one particular industry—the petroleum industry—the way in which society, science and technology interact to-day, and the limits which are set to what is technologically or socially possible. Sir Hugh Beaver, in the sixth Graham Clark Lecture to the Institutions of Civil Engineers, of Mechanical Engineers and of Electrical Engineers on March 3, assayed an even larger canvas. Under his title, "Engineering and Civilization", he reviewed the earlier five lectures as chapters in an attempt to discern the meaning of civilization and, putting these lectures into the perspective of the wide field of engineering thought, endeavour and achievement, he attempted to envisage the duty of the engineer in the new world that is so rapidly developing before us. Despite the different starting points and lines of approach, Mr. Herbert's and Sir Hugh Beaver's lectures have a good deal in common, and it is noteworthy that, like Dr. Comfort, they lay considerable stress on the importance of due attention to the problems of the under-developed territories, though incidentally Sir Hugh does not accept the view that the gap between the 'haves' and the 'have nots' is widening.

Sir Hugh Beaver starts with this fact that the population of the world is advancing at what by any calculation is a staggering rate: at the present rate of increase it will be 4,000 million in some 20–25 years time and 5,500 million by the end of the century. While the so-called under-developed countries are ceaselessly claiming the attention, service and money of the nations of Europe and North America, at the same time they are adamantly asserting their own authority and independence. The speed of advance which all these emerging countries envisage would more than tax all world resources, however mobilized, and their hopes are not in any way to be achieved by all the available money, however well used. Besides this, he pointed out, science and technology have brought us to the very edge of potential world destruction, and scientific research has brought us perhaps just to the threshold of the secret of the creation of living organisms.

The Western world is thus at a critical point in its history, and it is the basis of Sir Hugh's argument that engineers have a special responsibility because they have built this modern world of convenience and comfort, and all through the ages have not only been improving life but have also produced all the means and machines of destruction. In the first of the Graham Clark Lectures, Sir Harold Hartley reviewed the engineer's contribution to the conservation of natural resources; and without going into the picture Sir Harold Hartley displayed, Sir Hugh Beaver expresses the opinion that it is both incorrect and dangerously misleading to think that the basis of developed engineering is shortage of man-power. On the contrary, to-day we are proving that man-power is the basis of engineering, and Sir Hugh fears that we in Britain may eventually find ourselves out-distanced by our competitors simply because of their greater sources of man-power.

Sir Maurice Bowra, in the second lecture, dealing with the impact of engineering on society, suggested that without engineering civilization is impossible, and that China and Greece and Rome in turn lost their leadership in the world of their days because they treated engineering as of secondary importance. Sir Ewart Smith, in the fourth lecture, on "The Engineer and Management", claimed that the advance of science and its practical application through engineering and chemical technology had shown that mankind had the potential ability to achieve any standard of material well-being that may be desired; and whereas Sir Maurice Bowra had suggested that the engineers had gone wrong by assuming that improving the human lot just meant the greater exploitation of natural resources for the benefit of humanity, Sir Ewart Smith, more positively, but in the context of management, had added that our own civilization could continue successfully only if it achieved a balanced combination of the humanities and technology, based on both science and art. Though this criticism or suggestion is continually being made now, Sir Hugh Beaver pointed out that it was not always made: in the age of Leonardo de Vinci, the Elizabethan age or when the Royal Society was founded, this distinction between culture and art and science and engineering did not exist, and the fathers of engineering as we know it in Britain were drawn from very varied origins to the adventure of practical and creative engineering.

Recalling Bacon's use of the Sphinx's riddle in the series of mythological fables that he called the 'Wisdom of the Ancients", Sir Hugh suggested that there are two kinds of riddles, one kind relating to the nature of things and the other relating to the nature of man, and that this perplexing, harassing problem may really be all or part of the explanation of the failure of some to distinguish between their duty to their country and their duty to mankind. Unless we can solve these problems arising in the impact of science on mankind, we must face the extinction of civilization and perhaps of mankind, and that is the problem particularly of scientists, technologists and engineers. What faces us here particularly is not what are the proper proportions of our man-power to be directed or attracted to this discipline or that, but how we are best to educate this and future generations in which inevitably the preponderance of educated output must be scientific and engineering.

This was the essential theme of Sir Ifor Evans's third Graham Clark Lecture, "The Place of Engineering in University Education"; but Sir Hugh ranged far outside that lecture in his survey of the way in which a balanced combination of the humanities with technology is to be achieved, referring particularly to Sir Eric Ashby's views as expressed in "Technology and the Academics", to that expressed by Huxley in 1867–68 in evidence to the Parliamentary Select Committee on Scientific Instruction, and to Sir Patrick Linstead's Hinchley Memorial Lecture in 1957. But it is not enough, Sir Hugh Beaver urged, for educationists to be giving thought to this problem of producing adequate citizens for the new world, who can deal with the problems of a scientific age, whether they approach them from the side of arts and the humanities or from the side of science and engineering. It is a matter for thought by engineers themselves, particularly as to how to produce the scientist and engineer as fully educated citizens of their country and of the world.

There is another aspect to be considered. Sir Maurice Bowra pointed out that no engineering had ever been revolutionary in the political sense, and engineering is not a political activity. Nevertheless, no one has the right to disclaim or 'opt out' of politics, least of all the engineer. Sir Hugh Beaver urged strongly that the great professional institutions should give continuous, and not just occasional, thought to these educational and political issues; that they should consider how far they could, in part at least, rectify omissions in the post-university life, and regard themselves not solely as platforms for technical discussion but also as providing the means of studying how engineers of the future could make a greater contribution to civilization.

Mr. Le Q. Herbert's address, particularly when he discusses the relations between the refinery and the community, shows how fully some responsible professional men recognize such responsibilities. When the graduate chemist or engineer carries Western culture into less-developed countries, said Mr. Herbert, urgent and ethical problems may arise, and we cannot leave them, with their wide implications, to solve themselves. He suggested that a great responsibility lay upon the scientist, the technologist and any other professional man when it came to considering how Western technologies could best assist the emergent or resurgent countries in achieving their national aims, and here above all the relation of professional ethics to industry and society must be acknowledged and used for good.

While Mr. Herbert clearly recognized that the professional societies have their part to play, he was also convinced that industry itself had its own responsibility for taking over the broadening process where the universities left off, and, by selecting, planning and helping the young scientist or technologist in his career, to develop this vital relation between industry and society. Professional institutions, the universities and industry have all their part to play in producing the type of man required; but it is as clear from these latest addresses as from that of Sir Solly Zuckerman that it is increasingly true that limits are set in other fields to what science or technology can do. Political strategy —and even the purpose behind the strategy—may be determined by decisions taken in quite unrelated fields, by the way in which the discovery of new ways of doing things transforms the things being done. As Sir Solly remarked, the element of the unknown in government increases with every step we are now taking to apply the fruits of science; the controversy that has recently arisen over the Government's policy with regard to the *Blue Streak* missile aptly illustrates the point. The urgency of this matter of a broad education can scarcely be over-stressed; it is important from the point of view of ensuring a stream of scientists and technologists and engineers, of administrators and statesmen alive to the human as well as to the technical issues involved in major political decisions, and equally important for securing public understanding and public acceptability of wise decisions made with full realization of the way they determine the future. It is to be hoped that the Minister for Science as well as professional associations of scientists and technologists will give due heed to Sir Hugh Beaver's appeal.

MAN-MADE FIBRES

Man-Made Textile Encyclopedia
Edited by J. J. Press. Pp. xxx+913. (New York: Textile Book Publishers, Inc.; London: Interscience Publishers, Ltd., 1959.) 200s.

WITH the possible exception of synthetic dyes, man-made fibres have been the most significant contribution of the scientist to the textile industry. These materials have greatly increased the scope of textile designers, and the public has been given a wider selection of interesting and attractive fabrics and garments often at low prices. Every industry has benefited from the introduction of the new fibres for they have enabled basic operations such as transportation and purification to be carried out more effectively and more conveniently. The textile industry itself has also gained much, for the advent of the new materials has stimulated research and development in all branches of textile science and technology, not least in the manipulation of natural fibres. The offspring of the chemical and engineering industries, the man-made fibre industry is forward-looking and progressive, taking full advantage of the latest scientific and management techniques. Large sums of money are devoted to long-term research which has already resulted in the appearance of many new fibres and new methods of fibre production and processing. Even though the man-made fibre industry is comparatively young, a great mass of information covering all aspects of fibre production and manipulation has been published. Much of it, particularly that dealing with the technology of man-made fibres, is not readily accessible, and the publication of an encyclopædia such as the one under review is therefore welcome. The editor has been fortunate in securing the services of many authors, each an expert in his own field. The various sections of the book are therefore authoritative and informative.

The work is divided into twenty-two chapters and covers all aspects of man-made textiles, from the chemistry of the raw materials from which the fibres are made to methods for marketing the finished fabrics and manufacturing them into garments. Such a work could have been a rather uninteresting catalogue of equipment, machine settings and recipes, but this has been avoided. Even though a great deal of information is given (often in the form of well-constructed tables) the work is essentially a collection of readable essays welded together by careful arrangement into a complete whole. While the book will undoubtedly be used mainly as a reference book on general textile principles and practice, it is also valuable in revealing current trends. The opening chapters deal with the constitution and properties of the materials from which man-made fibres are made. Very appropriately this section is edited by Dr. Herman F. Mark, to whom the encyclopædia is dedicated. Accounts of fibre-manufacturing processes follow and include a short article on the production of superfine ($< 1\mu$ in diameter) thermoplastic fibres. The properties of man-made fibres and methods of fibre identification are then discussed in some detail. The technology and principles of converting fibres into yarns and finished cloth are dealt with in a general way, interesting sections being included on significant modern topics such as tow and high-bulk staple processing, non-woven textiles, and tufted materials. Cloth production and weaving are presented in relation to specific end-uses; for example, industrial and military fabrics, apparel fabrics, and household fabrics (floor coverings and upholstery fabrics). Some sixty pages are devoted to a most important discussion entitled "Textile Engineering Principles", which illustrates the modern scientific approach to the building of textile fabrics. In the sections on the dyeing, printing and finishing of fabrics, methods of handling most of the important man-made fibres are indicated, and the work is completed by accounts of topics such as knitted fabrics, garment manufacture, dry cleaning, commercial laundry practice, modern home washing methods, performance standards, statistics and marketing. A useful list of trade names of almost every man-made fibre in production is also given.

The discussion of such a wide range of topics necessitates a general treatment of each, but in spite of this a surprisingly large amount of valuable material has been included. The presentation is excellent, and a remarkable uniformity has been achieved throughout. The book is a valuable addition to the literature of textiles, not only because of its wide coverage but also because of the many unusual topics which are considered. Few will open this book without finding something to interest them. To prepare such a work and to maintain a consistently high level throughout is in itself a great achievement, and it is perhaps churlish to suggest omissions, as no doubt the editor had to make firm decisions to cut out much which he would have liked to include. He could, however, with advantage have introduced more references to original papers and specialized review articles. These would have added considerably to the usefulness of the volume. C. S. Whewell

COLORIMETRIC ANALYSIS

Colorimetric Determination of Traces of Metals

By Prof. E. B. Sandell. Third edition, revised and enlarged. (Chemical Analysis: a Series of Monographs on Analytical Chemistry and Its Applications, Vol. 3.) Pp. xxii+1032. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1959.) 185s.

A Handbook of Colorimetric Chemical Analytical Methods

Fifth edition. Pp. 360. (Salisbury: The Tintometer, Ltd., 1959.) 30s. net.

THE chemical analysis of traces of substances is now of great importance in areas as diverse as applied nuclear physics, soil science and medical chemistry. Colorimetric procedures are generally preferred for these determinations of trace elements. Although other, and often better, techniques are available, the expensive equipment required puts them outside the scope of all but highly specialized laboratories.

Prof. Sandell's book now achieves its third edition, which is about half as big again as the previous edition despite the removal of a good deal of the original material. The appearance of this volume is a tribute not only to the increased application of colorimetric methods but also to the great variety of new reagents and procedures which have been proposed in recent years. Prof. Sandell has not attempted to compete with the encyclopædic work of Snell and Snell. He has restricted himself to metals, and has chosen only a few procedures for the determination of each metal; his broad experience of chemical analysis and his common-sense approach ensure that the selection comprises the most useful and widely applicable procedures.

The text is divided into two parts: general aspects of inorganic colorimetric trace analysis, and procedures for the determination of traces of metals. Part 1 contains penetrating discussions on general trace analysis, on the separation and isolation of traces, on the application of colorimetry and spectrophotometry to their determination, and on colorimetric reagents. Colorimetry is regarded in its widest sense, fluorimetry, nephelometry and turbidimetry being included. In Part 2, which makes up two-thirds of the text, each metal is discussed under the headings of separation, methods of determination and, where the information is available, applications.

The sad fact that the development of new reagents has far outdistanced knowledge of their applications is repeatedly emphasized. Too often, new reagents are proposed without any reference to their behaviour in the presence of likely interfering elements and without reference to any advantage which the new procedure may have over earlier methods. The examination of the new reagents seems to be undertaken as an academic exercise and frequently an incomplete one at that. However, Prof. Sandell has picked his way with sure steps through the wide variety of methods available. Although the book is large, the subject has been treated with acuity, brevity and clarity, which are the more admirable when the multitudinous original sources are considered. The text is indispensable to all who are interested in colorimetry or trace analysis.

Little need be said concerning the second book, which contains the methods recommended by Tintometer Ltd. for use with their Lovibond range of apparatus. Contained in a loose-leaf binder, the sections deal with the apparatus, *p*H measurements, inorganic and organic chemical analysis, chemical pathological analysis, noxious vapours and miscellaneous methods. Any additions will be supplied free of charge for the next two years. The fifth edition has been enlarged and almost completely revised.

This collection of methods should prove useful in routine laboratories, for the procedures have been thoroughly checked by many workers and there should be no doubt of their reliability. The claims made for the convenience of the binding method would have been more impressive had the folder not come apart on preliminary handling.

A. M. G. MACDONALD

ANNUAL REVIEWS ON INORGANIC CHEMISTRY

Progress in Inorganic Chemistry

Vol. 1. Edited by F. Albert Cotton. Pp. ix + 566. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1959.) 109*s*.

THIS book consists of seven review articles considered to be of interest to inorganic chemists. This new series, appearing so soon after the first volume of "Advances in Inorganic and Radiochemistry" edited by Emeléus and Sharpe, must raise the question of their desirability, although it would appear that "Progress in Inorganic Chemistry" was first in conception. There is only one paper which is not in English, so that we may consider that the alternative places for publication of such articles would be *Chemical Reviews* or *Quarterly Reviews*, each catering for a rather different approach from the other. The excellent article by Roland Ward on mixed metal oxides, which is particularly notable for the clarity of its diagrams, seems to exemplify the type of paper for which "Progress in Inorganic Chemistry" was created. It would not fit easily into either of the existing journals for reviews.

However, this is not altogether true of the other papers in this volume. Becke-Goehring writes on nitrogen–sulphur compounds although there is a similar review on tetranitrogen tetrasulphur in *Quarterly Reviews*. "Interstitial Compounds of Graphite" by Hennig, which is more comprehensive than the corresponding article in "Advances in Inorganic and Radiochemistry", gives a good account of a subject in which little is definitely known. Too much inconclusive work is included. Again, "Metal-Ammonia Solutions" has recently appeared in *Quarterly Reviews* although the present review is more comprehensive.

The *Chemical Reviews* type of article is exemplified by that of Wilkinson and Cotton, who give an exceptionally good account of the rapidly expanding field of cyclopentadienyl and arene metal compounds. The only criticisms that can be made of this article are that the crystallographic nomenclature (on p. 30) is very inaccurate and that certain workers come in for excessive criticism. A somewhat similar paper by Malatesta on "Isocyanide Complexes of Metals" shows clearly the need for more structural work in a field in which problems abound. The crystallographic data cited in some cases are not the most recent, and the chemical nomenclature leaves much to be desired.

The only other paper is by George and McClure, on the effect of inner orbital splitting on the thermodynamic properties of transition metal compounds and co-ordination complexes. Reviews on this topic are usually either too elementary or go to the other extreme and assume at some stage that the reader is familiar with the work of Condon and Shortley. This comprehensive article, which includes a great deal of new material, goes some way towards the intermediate stage.

Altogether the reviews are satisfying, but with the tremendous accumulation of papers to be read through in a year any new source must prove its worth. The main task here lies with the editor in a skilful choice, preferably of topics which cannot suitably be treated in other places, or where a review is necessary to stimulate interest and bring in new research workers.

There are few misprints and errors, and the text is well produced.

I. R. BEATTIE

RELATIVITY

Theory of Relativity

By W. Pauli. Translated from the German by G. Field. Pp. xiv + 241. (London and New York: Pergamon Press, 1958.) 35*s*. net.

The Theory of Space, Time and Gravitation

By V. Fock. Translated from the Russian by N. Kemmer. Pp. xviii + 411. (London and New York: Pergamon Press, 1959.) 100*s*. net.

THE distressing thing about relativity is that the part of it which deals with gravitation—the general theory—is so isolated from the rest of physics. This is understandable, since gravitational forces are unimportant in atomic and nuclear physics, and non-Newtonian effects in astronomical systems are extremely small. Moreover, Einstein's idea of geometrizing gravitation has not yet been successfully extended to other fields of force. For these reasons, the general theory, for all its beauty and profundity, has until recently been rather neglected as a subject for research. This situation changed about five years ago; since then there has been a tremendous surge of interest in general relativity. This interest is based mainly on the hope that, despite its quantitative unimportance for contemporary physics, gravitation and its geometrical description may be qualitatively important in the fundamental physics of the future.

In the light of this development the two books under review form a remarkable contrast. They are both written by famous physicists best known for their contributions to atomic theory and quantum mechanics, and they are both beautifully translated. But there the resemblance ends. For Pauli's book was written when he was a student of twenty-one, barely five years after the publication in 1916 of Einstein's definitive paper on general relativity, while Fock's is the product of a mature mind reflecting on a forty-year old theory. Yet Pauli's book reads as though the theory had already reached completion, while Fock's suggests that both its physical significance and its implications are not yet understood.

This contrast makes Pauli's book a simpler introduction to the subject, but correspondingly less stimulating to the research worker. It is better documented, more systematic in its presentation of standard material (in special as well as general relativity), and shows an astonishing breadth and mastery for so young an author and a subject. Greater glory was yet to come; but in none of his later writings did Pauli surpass in clarity, profundity or authority this juvenile performance.

To a modern eye some of his material lacks the interest which Pauli then attached to it, but this defect is balanced by the addition of twenty-three supplementary notes written in 1956 for this English edition. They contain an account of two of the main developments since 1921, namely, attempts by Einstein and others to unify gravitation and electromagnetism, and, in somewhat less detail, Friedmann's discovery of time-dependent cosmological solutions of Einstein's equations. There is a brief mention of the work of Einstein, Infeld and Hoffmann, and of Fock on the derivation of the equations of motion of material bodies from the field equations, but virtually nothing on such topics of recent interest as the initial-value problem, the quantization of the theory, and the associated problem of the existence and properties of gravitational radiation.

In contrast, it is the problems of deriving equations of motion and the properties of radiation which form the heart of Fock's book. His introduction to special and general relativity contains many interesting twists; but the main importance of his book lies in its detailed presentation of his own heroic calculations. He differs from Einstein, Infeld and Hoffmann in his systematic use of a stress tensor to describe matter, instead of regarding it as a singularity in the geometrical structure of space. He finds approximate solutions of Einstein's equations for both non-rotating and rotating masses, and obtains their post-Newtonian equations of motion and expressions for the gravitational potentials in the wave-zone. The calculations are extremely intricate, but are presented very clearly.

Fock performs his calculations in a particular co-ordinate system—the de Donder or harmonic system. If the space is Minkowskian at infinity, and if certain other conditions are satisfied, these co-ordinates are uniquely defined up to a Lorentz transformation. Fock believes that they are the natural analogue of the inertial systems of special relativity. In his view they do more than simplify certain calculations; they are of deep significance to the theory as a whole. This view is not shared by all students of relativity, most of whom believe that in general no particular significance can be attached to special co-ordinate systems. In their view all the physical implications of Einstein's theory can be expressed in terms of invariants which are completely independent of the choice of co-ordinate system. Only in special spaces (for example, those which satisfy simple boundary conditions at infinity, or which admit a group of motions) can a special co-ordinate system simplify calculations. In his book Fock defends his view in detail, and it is valuable to have this clear statement of his case. Whatever the final decision may be, his own calculations form a permanent addition to our knowledge of Einstein's theory.

D. W. SCIAMA

ENDOCRINOLOGY OF REPRODUCTION

Recent Progress in the Endocrinology of Reproduction

Proceedings of the Conference held in Syracuse, New York, June 9–12, 1958. Pp. xi+532. (New York: Academic Press, Inc.; London: Academic Press, Inc. (London), Ltd., 1959.) 12 dollars.

CONFERENCES and symposia on endocrinological subjects have been multiplying in recent years and it is becoming more and more common for the proceedings to be published *in extenso*. The practice has, however, several disadvantages. Some of the introductory general papers often provide nothing more than a refurbishing of material that has been published already or is in press. It is only when they give a critical and up-to-date account of a particular field which has not recently been covered that such papers are valuable. Other shorter contributions tend to report work in progress in an incomplete fashion, or because the editorial hand is often more gentle with invited papers, sometimes circumvent the full rigours of the refereeing system that submission to an appropriate scientific journal would entail. Finally, the printed proceedings are often long delayed and costly and the general result is further crowding, confusion and reduplication in an already overloaded literature.

Yet, with all these reservations one has to concede a warm, if reluctant, welcome to the published proceedings of another conference on the "Endocrinology of Reproduction", this time held at the New York State University Medical Center, Syracuse, during June 1958.

The arrangement of the programme was a logical and thorough one, beginning with a consideration of ovulation and passing via the hormonal balance in the normal cycle to fertilization, implantation, pregnancy and finally to parturition and lactation. The speakers on these topics were equally well chosen.

It is inevitable that among a collection of twenty-three papers, some should stand out as especially interesting to someone who wants to keep abreast of the current trends of opinion in reproductive physiology. Such are the papers by Chang on the fertilizing capacity of sperm, by Harris on the integrations between nervous and endocrine systems where they meet and overlap to control the process of ovulation and by Folley and his colleagues on mammary growth and lactation. Others like that of Heller on the neurohypophysis during the œstrous cycle, pregnancy and lactation emphasize areas where research effort has been lacking and where fresh work, in this case on changes in water metabolism during the reproductive cycle, might be very profitable. The remaining papers are more in the nature of progress reports on work in hand. There are several on the levels of hormones to be found in the urine both during normal cycles and in pregnancy, and other topics include the capacity of the placenta to produce hormones, and the latest evidence about the status of relaxin as a hormone. A notable and pressing omission from the topics discussed at the meeting is the control of overall fertility patterns in relation to the world's population problem.

At its American price of 12 dollars this book is not perhaps an essential purchase for one's own bookshelves, but it is certainly worth reading.

P. L. KROHN

BRAIN AND BEHAVIOUR

The Central Nervous System and Behavior

Transactions of the Second Conference, February 22, 23, 24 and 25, 1959, Princeton, N.J. Edited by Mary A. B. Brazier. Pp. 358. (New York: Josiah Macy, Jr. Foundation, 1959.) 4.75 dollars.

THE verbatim recording and publication of papers and discussions presented at extended symposia is a characteristically American contribution to contemporary scientific communication. Well done, it conveys a remarkable atmosphere of actuality. Its informality is refreshing, and it permits the reader at some small remove of time to be taken to the brink of current experiment and speculation. Occasionally interruption of the text by interjection or argument is distracting; but more often it is both revealing and stimulating. The spirit of such meetings is epitomized by Dr. Fremont-Smith in his introduction to the present volume when he quotes the admonition "Don't speak when I'm interrupting".

This book presents the transactions of a conference held at Princeton in February 1959 and devoted mainly to the study of changes in animal behaviour induced by experimental cerebral lesions. The participation of a dynamically orientated psychiatrist (Douglas D. Bond) is revealing evidence of the mantle of scientific respectability worn by psychoanalysis in the United States, but still firmly denied to it in neurophysiological circles elsewhere. Dr. Bond's discussion of the possible relation between the behaviour which follows experimental hippocampal–amygdaloid lesions in the animal and that seen clinically in human anorexia nervosa is intriguing, as are some asides on the effect of a number of commonly used drugs such as amphetamine, meprobamate, and chlorpromazine, on animals subjected to similar cerebral lesions.

In other sections of the book Grastyan (Hungary) discusses electroencephalographic changes recorded in the hippocampus of the cat during the development of conditioned reflexes, and Bures (Czechoslovakia) the effect on behaviour of transient depression of cortical activity in the rat by the local application of chemical substances such as potassium chloride. Probably the chapter of greatest general interest is that by Rusinov (Moscow) on electroencephalographic work during the establishment of conditioned reflexes in man. Only here and in Dr. Galambos's (Washington) stimulating "summation" does the discussion briefly develop from technological detail to tentative philosophical generalization.

The book closes with an interesting account of Mary Brazier of a preceding colloquium on the electroencephalographic and higher nervous activity held in Moscow in October 1958. From this it is clear that the academic authorities of the U.S.S.R. have not been behindhand in sharing with the Americans the organization of similar high-level meetings for the exchange of knowledge and ideas in the neurological sciences.

It is depressing to note that although several speakers pay tribute to the contributions of Darwin, Hughlings Jackson and Sherrington to the scientific investigation of behaviour, references to current British work are almost non-existent, and that one British scientist attended the Moscow meeting, none the American. Fortunately the Macy and National Science Foundations, by making this excellent volume available at a relatively modest price, enable us to profit vicariously by the efforts of our more energetic colleagues.

HENRY MILLER

NORTH AMERICAN FRESH-WATER BIOLOGY

Fresh-Water Biology

By Henry Baldwin Ward and George Chandler Whipple. Second edition edited by Prof. W. T. Edmondson. Pp. xx+1248. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1959.) 276s. net.

THIS new edition of an old favourite that appeared in 1918, virtually a new book, covers the fresh-water fauna and flora of North America except for free-swimming cercariæ, spiders and vertebrates. Forty-two groups are handled by fifty-one authors, two of whom are survivors from the first edition. In nearly half the groups the keys go down to species, and these tend to be the groups which have been neglected, in Europe at least, such as Porifera, Coelenterata, Gastrotricha and Tardigrada. The Crustacea are treated fully; but the keys to all the insect orders and to some other large groups go no further than genera. The introductions to the book and to each chapter give no more information about morphology and technique than is necessary for an understanding of the keys, and there is less of a general nature than in the first edition.

Illustrations are plentiful and good, the text is well laid out, and more than that it would be impertinent for anyone not closely acquainted with the American fauna to say. The question is: How useful will this book be in Britain? It covers the United States and Canada, an area that extends almost from the tropics to the Arctic, which means that it includes many more species than are found in Britain and in any European book, since all are on a national basis, "Faune de France", "Tierwelt Deutschlands", "Danmarks Fauna" and so on. There are, for example, 53 genera of Ephemeroptera in America, which is 5 more than the total number of British species; all but one of the 18 British genera are included in the 53. There are 89 species of Cladocera in the

Freshwater Biological Association's key, 121 in Ward and Whipple's and 60 are common, but this is a group well known for its cosmopolitan distribution and in many others the overlap is much less.

The references vary from chapter to chapter; sometimes there are none to European work, sometimes the main ones are included, particularly if they are written in English.

It is clear, then, that whoever uses the new "Ward and Whipple" will have to struggle with keys that are larger than is necessary for his purpose and which probably do not include the species before him. Moreover, there is much more on the European fauna than was available to his predecessor using the first edition. On the other hand, almost all freshwater animals and plants are dealt with between two covers and the book must therefore contain some organism allied to any specimen the identity of which is to be ascertained. This can be comforting to somebody who has prowled in vain around a scientific library searching for a key to the group to which a specimen is thought to belong, and even more comforting to somebody who has no scientific library to prowl around. A second point that will endear this new volume to a new generation is the full treatment of neglected groups. I believe, therefore, that the book will be found not to have lost its old appeal.

T. T. MACAN

OPTICAL ROTATORY POWERS OF ALKALOIDS

Tables of Constants and Numerical Data

11: Selected Constants: Optical Rotatory Power. 4: Alkaloids. By Prof. J.-P. Mathieu and Prof. M.-M. Janot. (Publication subsidized by the Member Countries of the International Commission of Tables of Constants and by the Centre National de la Recherche Scientifique.) Pp. v+211. (London and New York: Pergamon Press, 1959.) 160s. net.

THE present volume is the eleventh in the series of "Tables of Constants and Numerical Data", founded in 1909 by C. Marie, and it is the fourth in the series devoted to the optical rotatory powers of naturally occurring substances. The preceding volumes dealing with optical rotatory power have covered the steroids (1956), the triterpenoids (1958), and the amino-acids (1959), and all four have come under the general editorship of Prof. J.-P. Mathieu with the aid of specialists in the particular fields concerned. In this volume, devoted to the alkaloids, Prof. M.-M. Janot has collaborated with Prof. Mathieu, and Sir Robert Robinson has provided a foreword.

In view of the greater chemical diversity of the alkaloids the material covered in this volume is inevitably more heterogeneous than that considered in the preceding volumes, and the main function of the book is to collect together in one place the data scattered throughout the literature on optical rotation measurements made on alkaloids. The editors have been faced with the well-known problem of defining an alkaloid, and they have therefore based their criteria for inclusion on the considerations that the alkaloids form a group of organic compounds of vegetable origin, always containing nitrogen, possessing more or less pronounced basicity, yielding precipitates with certain 'general' reagents, and being endowed with remarkable pharmacological activities. It is realized, of course, that such a classification is somewhat arbitrary, and the editors have compiled a list of the known alkaloids, including minor alkaloids and many that have no action on polarized light, provided that an empirical formula has been assigned.

In the table of rotatory powers, the alkaloids and their salts are listed in alphabetical order by trivial names with molecular (or empirical) formulæ and melting points. Other column entries are molecular weight, and solvent, concentration, temperature, and wave-length for which the recorded specific rotations have been measured, and, finally, bibliographic references. The table, which has been compiled essentially from data found in original papers, occupies 166 pages, and the bibliographic references, given in a most convenient and compact form, occupy 23 pages, followed by an author index (10 pages) and a formula index (8 pages). The references (1809) span the interval between 1873 and mid-way through 1959, and their distribution over the years provides an interesting sidelight on activity in the field of alkaloid chemistry. Thus, the six decades from 1870 to 1929 provided only 19·3 per cent of the references, and the three decades since have provided respectively 18·4, 14·7, and no less than 47·7 per cent of the references. In fact, about one-third (32·8 per cent) of the bibliography relates to the last five and a half years covered, and it is obvious that, at this time of intense activity in the field of alkaloids, the present volume will be welcomed in laboratories where alkaloids are being studied.

It is a pleasure to note that a return has been made to a conventionally printed style, employing minute but very legible type, and the binding matches that of earlier volumes in the series.

J. WALKER

A MYTHICAL SCIENCE

The Masks of God

Primitive Mythology. By Joseph Campbell. Pp. viii+504. (London: Martin Secker and Warburg, Ltd., 1960.) 35s. net.

THE publishers claim that "The Masks of God" is "undoubtedly a landmark in its own field". Alas! Like so many landmarks it is also a folly.

The author's purpose is "the first sketch of a natural history of the gods and heroes, such as in its final form should include in its purview all divine beings. . . . For, as in the visible world of the vegetable and animal kingdoms, so also in the visionary world of the gods: there has been a history, an evolution, a series of mutations, governed by laws; and to show forth such laws is the proper aim of science" (p. 5). A new-born chick, says Dr. Campbell, will dart for cover when a hawk, or a model of a hawk, passes overhead—but not when the bird is a gull, duck, heron, or pigeon, or model of these latter. This kind of response to inherited, not taught, "innate releasing mechanisms", Dr. Campbell continues, is shared by human beings; and the biology, psychology, sociology and history of the sign stimuli which release these mechanisms of inheritance "constitute the field of our subject, the science of Comparative Mythology" (p. 41).

There is here a major distinction between what is common to all men and what is culturally determined;

there is also a distinction between part of the process of 'making' myths, and mythologies, which the author seems scarcely aware of. From such beginnings, without any analysis of the mechanisms of inheritance, mythologies are classified into those of the hunter, the planter, the ancient city dweller, and the peoples of prehistory; and an attempt is made to show, using the theories of the diffusionist and *Kulturkreis* schools—unconvincingly, I think—how such types of myths might have spread or diffused. The classification is useful: there are some interesting passages on the cuckoo, divine kings, the ritual love-death, shamanism, cave painting, a stickleback, and palæolithic and neolithic man, but the relations between the inherited image—imprinted on man's mind some 600,000 years ago, the poetic vision, cultural determinism, and culture change and diffusion remain —as one would expect—wholly obscure.

Diffusionist theory is necessary to this kind of construct, and some theories might provide models for what to-day is called 'acculturation'. Why cite Forbenius and Haeckel—who failed to construct such a model—and not Perry and Elliot Smith—who did? The seminal work of Hocart, Halbwachs, Van Gennep, Levi-Strauss, and Leenhardt is not mentioned. Indeed, these authors can offer little to one who, though some sort of Jungian, is determined to take his departure from Bastian without taking Neumann into account.

If there were a personal and imaginative synthesis the strange choice of authorities would not matter. For the central problems—how myths come to exist, penetration of the divine or mystical experience, the relation of myths to particular kinds of social structure and culture—are real and outstanding. But they will not yield to grandiose pretensions, second-hand psychology, muddled sociology, bad history, and an appalling confusion of biological and cultural levels.

K. O. L. Burridge

RADIATION AND THE BROAD BEAN

Radiation Biology of *Vicia faba* in Relation to the General Problem

By Dr. John Read. Pp. xxii+270. (Oxford: Blackwell Scientific Publications; Springfield, Ill.: Charles C. Thomas, 1959.) 45*s*. net.

THE roots of broad bean seedlings are stout and not very exacting in their requirements for good growth. The meristematic and differentiating zones are well demarcated, and squash preparations can easily be made to display the chromosomes in dividing cells of the root-tip. The chromosomes themselves are large and only twelve in number. The growth-rate of the roots can easily be measured by their increase in length. These are the main characteristics which have led many of those working on the effects of radiation on living systems to adopt the broad bean as their experimental material.

Dr. Read gives a systematic account of this work, restricting himself almost exclusively to investigations published after 1939. The reader is led in the early chapters through the effects of radiation on growth-rate, to a consideration of the inhibition of mitosis by radiation. It is the contention of the author that many effects of radiation on growth-rate stem from damage to the genetic material, and it is to an analysis of chromosome aberrations in relation to radiation that much of the book is devoted. The various conflicting theories as to the nature of chromosome aberrations are considered in detail in the light of all the available evidence as to the influence of the type of radiation, the dose-rate and the various environmental factors which affect the production of aberrations. Deoxyribonucleic acid synthesis after radiation is considered briefly, as is a comparison of radiation with radiomimetic chemicals in their effects on the bean root. Throughout, the results obtained with broad beans roots are compared with those obtained from other living systems. In a final chapter a valuable summary is made of the comparisons of this type which have been made in previous chapters. Dr. Read presents a formidable case for the utility of his superficially trivial experimental material. There is a bibliography of more than two hundred titles.

The presentation of the book is excellent, the type being large and clear and the text figures bold. Those intimately concerned with the biological effects of radiation will be grateful to Dr. Read for drawing together in such an accessible manner all the important information on *Vicia faba* and radiation.

HISTORY OF ENGINEERING INVENTION

Science as History

The Story of Man's Technological Progress from Steam Engine to Satellite. By Heinz Gartmann. Translated from the German by Alan G. Readett. Pp. xvii+348+51 photographic illustrations. (London: Hodder and Stoughton, Ltd., 1960.) 25*s*. net.

"SCIENCE as History" has a more accurate subtitle "The Story of Man's Technological Progress from Steam Engine to Satellite". It is a popular account of engineering invention and development written around a number of the most important examples. The advance of the steam engine, motorcar and aeroplane, is followed by chapters on telecommunications, radio, radar, atomic physics, automation, and space exploration.

The author has not attempted a critical appraisal of the topics chosen—the work is in no way 'learned'; he has sought sensibly to recount some history in an interesting manner. In some chapters unnecessary detail clouds the overall pattern; for example, so many names appear in the steam engine section that the really important contributors never emerge. There is also a probably unavoidable national bias. When the United States, Britain, Europe and the U.S.S.R. are all working on similar problems, often under conditions of secrecy, it is exceedingly difficult to be just.

Some chapters lack balance; the space devoted to balloons and Zeppelins is twice that devoted to the immensely fertile period of aviation history from 1903 to date. Finally, the treatment of Dr. Eugen Sänger's lecture on relativistic mechanics applied to space flight is positively melodramatic.

In spite of these faults the book is immensely readable, beautifully produced, has a bibliography, and does display an appreciative understanding of the important and exciting developments selected. It deserves a wide audience.

J. L. Stollery

International Commission for Uniform Methods of Sugar Analysis

Report of the Proceedings of the Twelfth Session held at the National Bureau of Standards and at the Shoreham Hotel, Washington, D.C., U.S.A., from June 2nd to June 6th, 1958. Pp. vii+130. (Keston, Kent: International Commission for Uniform Methods of Sugar Analysis, Tate and Lyle Research Laboratories, New York: Sugar Research Foundation, Inc., 52 Wall Street, 1959.) 25*s.*; 3.50 dollars.

THE twelfth session of the International Commission for Uniform Methods of Sugar Analysis was held in Washington, D.C., in June 1958.

Its proceedings, which have now been published, contain detailed papers and discussions concerning some twenty-six problems which are primarily of special interest to those concerned with technical aspects of the sugar industry. The subjects for discussion included, among many others, such matters as the determination of sucrose and reducing sugars in molasses, the inorganic and organic constituents of raw sugars and sugar products, and factors causing deterioration of raw and refined sugars in storage and during transport. In each instance the problem had been referred to a group of experts from the various countries concerned. Their reports and recommendations for analytical methods are printed with full details of the experimental procedures. A verbatim account of the discussion which followed the presentation of each report is then given and finally the decisions of the Commission are recorded.

In some cases the referees' recommendations have been accepted only for guidance by analysts, no final decision being taken. It will be evident that this volume will be of interest mainly to professional analysts; but the methods described may be of great use also to investigators who have to deal with any aspects of carbohydrate chemistry which involve the separation and quantitative analysis of sugars.

E. L. HIRST

Precipitation Processes in Steels

Report of a Conference held in the University of Sheffield, 2–4 July, 1958, and organized by the Department of Metallurgy. (Special Report No. 64.) Pp. xiv+322. (London: Iron and Steel Institute, 1959.) 84*s.*

THIS account of a conference organized by the Department of Metallurgy of the University of Sheffield in July 1958 has been deemed of such interest by the Iron and Steel Institute as to justify its being published as a special report. With this opinion one must heartily concur. Twenty-one papers were contributed, grouped around the general themes of precipitation in ferritic and austenitic steels respectively, intergranular fracture and precipitation during creep. Such precipitation processes in alloy steels are obviously of the greatest practical importance and of very much theoretical interest; the time was ripe for such a discussion, and Prof. A. G. Quarrell, who appears to have initiated it, has clearly performed a most valuable service.

The quality of the contributions is high, a great deal of first-rate original work is included, and it is outside the bounds of possibility to review this in short space. One aspect of these papers, however, is outstandingly evident in the profuse use of electron-micrographs. After getting off to a slowish start in metallographic investigations, this technique has now established itself as an essential tool in this field. Where all is so good, it is quite unfair of a reviewer to single out for special mention the papers concerned with intergranular fracture in steel, but these four contributions, one from France and one from Sweden, go far to clarify a most important and elusive phenomenon.

This is a publication which it would not be easy to welcome in too high terms.

F. C. THOMPSON

Health Physics Instrumentation

By John S. Handloser. (International Series of Monographs on Nuclear Energy. Division 5: Health Physics, Vol. 1.) Pp. x+182. (London and New York: Pergamon Press, 1959.) 42*s.* net.

THIS book is primarily designed for those familiar with the basic physics of radiation detection who now wish to make measurements for radiation control purposes.

The commercial instruments discussed and the laboratory practices described are those currently used in the United States. This does not detract from the value of the book to users in other countries, as the writer in the chapters on portable survey instruments, fixed monitors and neutron monitors gives the basic principles used, and then describes the way in which they have been applied and developed by different instrument designers. The writer thus describes briefly the range of techniques and instruments used for the measurement of neutrons, γ- and β-radiation and leaves the reader to judge which method is most suitable for his problem. In all chapters the brief details are supported by adequate references.

The techniques described cover the range of energies from tens of kilovolts to tens of megavolts. There is no discussion of the measurement of radiation from the highest-energy accelerators as the writer considers that health physics instrumentation in this field is still a research problem.

Chapters are also devoted to counting rooms and their equipment, calibration techniques and miscellaneous instrumentation, and an introduction which discusses units of measurement and acceptable limits of exposure.

The book is a useful introduction to health physics instrumentation for those entering the field and is also interesting reading for those concerned with radiation measurement for protection purposes.

B. S. SMITH

A Manual of Practical Vertebrate Morphology

By J. T. Saunders and S. M. Manton. Third edition. Pp. viii+272. (London: Oxford University Press, 1959.) 30*s.* net.

"THE aim of this Manual is to provide the student with an accurate description of the anatomy of certain vertebrate types which are dissected in an elementary course of Zoology." Since 1931, when the first edition appeared, it is clear that this aim has been well justified. In the second edition (1949) there was a welcome addition of six chapters dealing with the dissection of certain muscle systems in the rat, pigeon, frog and fishes. Until this third edition, however, there has been no guide to the general dissection of a mammal. The new chapter on the rat has been prepared by Dr. M. E. Brown and Dr. S. M. Manton. There is little that I need add, for 'Saunders and Manton' needs no introduction to classes studying vertebrate morphology.

N. B. MARSHALL

AGEING AND RADIATION

By Dr. G. J. NEARY
Medical Research Council Radiobiological Research Unit, Harwell, Didcot, Berks.

STARTING with the pioneer work of Russ and Scott[1] and of Henshaw[2], it has repeatedly been suggested that whole-body irradiation of animals speeds up natural ageing[3-7]. Although highly specific long-term pathological effects can also be produced by irradiation[8], these may not arise in certain circumstances; for example, in animals undergoing chronic irradiation at rather low dose-rates or surviving the acute injury of single doses. Yet such animals die earlier than unirradiated controls, while the spectrum of pathological conditions present at death is about the same in both groups, that is, there is a non-specific shortening of life. Thus the evidence for a speeding up of ageing by radiation refers mainly to the late period of biological deterioration usually termed senescence (see review by Comfort[9]). Apart from fertility, physiological measures of ageing have not yet been studied as intensively in irradiated as in normal animals. Nevertheless, starting only from quantitative data on non-specific life-shortening in mice, I shall argue that there is some intrinsic process of biological ageing, enhanced by radiation, which operates from the start of life and is virtually complete by the time the changes of old age begin to appear. The argument has not been, and probably cannot be, established on a firm statistical basis from the data available. But because experiments in this field are difficult and because the establishment of some relation between natural ageing and that induced by radiation might afford a better insight into the nature of the fundamental mechanisms and lead to more fruitful experimental approaches, an attempt at an inductive generalization seems justifiable.

Theories of Ageing

In the context of ageing, two fundamental questions may be asked: Why does an individual die, and why do comparable individuals die at different times? The answers offered have fallen into two broad categories: (*a*) those which emphasize the element of randomness in mortality; (*b*) those which emphasize the genetically determinate element.

Random theories. Theories in this category, while recognizing that the outcome of the interaction between an environment and an individual depends on his genetic make-up, are concerned with the behaviour of a population of supposedly uniform individuals. Such theories attach considerable significance to the empirical age-specific death-rate, the so-called 'force of mortality', sometimes interpreted as the probability per unit time that any survivor will die in that time interval. For this to be true in an exact quantitative sense, all the individuals alive at a given instant would have to be identical, a qualification pointed out by Medawar[10], but not always sufficiently noted. The fact that the force of mortality in most populations increases with age beyond a certain point has been accepted as evidence of a progressive change in the population with age. Gompertz[11] noted that in human populations the logarithm of the age-specific death-rate increases approximately linearly with age from early maturity onwards, and so this quantity has been regarded as a general measure of physiological state, and its rate of change (approximately constant) as a measure of the rate of physiological ageing of the population, and even by tacit assumption, of each individual member thereof[12]. Sacher[13] has elaborated on these ideas in an elegant mathematical model which assumes that the individuals in the population are initially identical, but that due to random external stresses and physiological interactions there is a progressive drift and dispersion in the physiological states of those individuals. The death of an individual occurs when his physiological state transcends a certain limit. In this model the logarithm of the age-specific death-rate is directly proportional to the *mean* physiological state of the population at that age; the empirical Gompertz relation would thus seem to imply that the mean state changes linearly with time. The reality of the rate of physiological ageing so deduced will depend in any actual situation on the validity, among other things, of the assumption of initial identity of all individuals.

A progressive decline in physiological state or vitality is thus an essential feature of theories assuming random mortality, but a detailed causative mechanism for the decline itself is not usually specified.

Genetically determinate theories. These theories concentrate attention on the individual rather than the population and, in their quantitative aspects at least, on the component cells of the individual. The environment is scarcely considered explicitly, except as a more or less uniform influence; for a given environment the life-span of the individual is predetermined by the initial genetic endowment. In some theories, ageing is regarded as some process of change within cells themselves, possibly in their genetic apparatus[14-18]. These ideas are discussed further in the final section, but it is clear at once that the fate of the individual cannot be considered solely in terms of the fate of a component cell. In an animal, the cells are organized in a complex hierarchy of interacting anatomical and physiological systems. Thus while changes within cells may be the root cause of ageing and finally death, it may be inappropriate to consider the whole sequence of events solely in terms of the primary process. This idea is developed later on in this article.

A comprehensive general statement about the incidence of mortality in a group of individuals may be made in purely formal terms. An individual in a population is characterized by a particular value of some parameter τ, and the number of individuals in the class from τ to $(\tau + d\tau)$ is $N(\tau)d\tau$; there is a probability $p(\tau,t)dt$ that an individual in this class will die in the age interval from t to $(t + dt)$. The age-specific death-rate $\mu(T)$, at age T is then[19]:

$$\mu(T) = \frac{\int_0^\infty N(\tau) \, . \, p(\tau,t) \, . \, \exp\left[-\int_0^T p(\tau,t) \, . \, \mathrm{d}t\right] . \, \mathrm{d}\tau}{\int_0^\infty N(\tau) \, . \, \exp\left[-\int_0^T p(\tau,t) \, . \, \mathrm{d}t\right] . \, \mathrm{d}\tau} \qquad (1)$$

In the special case where all individuals are identical, the incidence of death as between individuals is random, and $\mu(T)$ reduces to $p(T)$. At the other extreme, where the death of a given individual occurs at a characteristic predetermined age. the parameter τ may be equated with the age at death of the individual, that is, $p(\tau,t) = 0$ for $t < \tau$ and $= \infty$ for $t \geq \tau$, so that $\mu(T)$ reduces to $N(T)/\int_T^\infty N(\tau).\mathrm{d}\tau$. In this case the age-specific death-rate is merely an expression of the distribution of individual predetermined life-spans; the concept of a 'force of mortality' liable to strike down impartially and at random any member of a collection of identical individuals is then quite inappropriate. Further, the slope of the Gompertz plot, $\partial \ln\mu(T)/\partial T$, in this case need bear no direct relation whatever to a rate of real physiological ageing either in individuals or averaged over the population.

In an actual population, the factors of randomness and genetic variation are both likely to contribute to the dispersion of life-times, and either may predominate. For the human white female population of the United States at present, Szilard[10] suggests that most of the dispersion represented by the standard deviation of about 10 years is genetic dispersion, since the component due to randomness may be estimated from records of identical twins to amount to only 3 years. Even in non-identical twins, the average difference of life-times is about twice that in identical twins[10].

It is clear, however, that the genetic determination of life-time does not operate in a void, as it were, without reference to the environment. This is shown by the appreciable increase in average human life-times in economically developed countries in the past hundred years or so[11,12]. Much of this increase is due to a reduction of mortality in early and middle age; the change in old age, though real, is much less. The causes of death showing a reduction of incidence are mainly the infectious diseases, and might loosely be termed 'accidents' along with earthquake, famine, flood and the like in the sense that they are not intrinsic and inevitable, but kill certain individuals who might otherwise have gone on to reach old age. Some types of tumour also are not diseases of old age and may be included with the 'accidents'. This kind of division of deaths into 'accidents' and 'senescent' deaths is not new in actuarial analysis[11,13,14], and it acquires a fundamental, as well as empirical, significance in theories of ageing based on changes within cells. Broadly speaking, the risk of 'accidental' death is spread over the whole life-time, whereas 'senescent' deaths are clustered closely in old age, so defining a mean potential life-span.

Jones[14], on the other hand, attaches much greater importance to the 'accidents' and suggests that disease experience short of lethality is itself the cause of ageing, through an autocatalytic process of physiological impairment which is expressed as an impartial susceptibility to further disease. He suggests that the reduction in mortality in later life that has occurred in human populations has been caused by the reduction in diseases in early life. The correlation may not be causal, however, but merely arise from a common factor of improvement of environment[12]. The results of experiments on mice exposed to infection[15,16] designed to test Jones's hypothesis were equivocal[6]. Jones also cites the fact that in human populations the age-specific death-rates for various particular diseases and the rate from all causes show similar rates of increase with age, and regards this as further evidence for an increasing general susceptibility to disease. While this process may occur, particularly during senescence, it is possible that the similarity in rates arises, at least in part, because they all primarily reflect the same thing, namely, the genetic distribution of potential life-span.

A new model of ageing. My model of ageing, arrived at from evidence on irradiated and unirradiated mice summarized below, combines elements from all the foregoing theories. It assumes that there is a common process at work in natural and radiation-induced ageing which is fundamental, inevitable and irreversible. Other processes may also contribute to ageing, some peculiar to natural and some to radiation-induced ageing[1-4], and in particular circumstances any one of these may be the dominant factor, while some may be largely irrelevant by-products of ageing so far as survival is concerned, for example, the greying of hair. The model implies, however, that even if all these other factors could be obviated, an irreducible intrinsic process would remain, which may in fact predominate in certain circumstances for carefully kept populations of laboratory animals.

This intrinsic ageing occurs in two principal successive stages, which between them occupy the whole life-time. First, a stage of intracellular changes probably accompanied by intercellular reactions proceeds insidiously and without marked physiological impairment; this stage is termed 'induction'. When a certain level of inductive change is approached, the second stage of ageing sets in rather abruptly. It involves a different level of organization and consists in physiological interactions which proceed autonomously and autocatalytically when once initiated and which lead to rapid impairment culminating in death; this stage is termed 'development'.

It is an essential feature of the model that, after development is triggered off, further inductive change is superfluous; thus radiation during development has comparatively little effect. Formally, induction corresponds to a progressive destruction of homœostatic mechanisms, while development corresponds to senescence itself. Although the distinction between the two stages is one of degree rather than of kind, it is valid in practice because the level of physiological impairment is an extremely non-linear function of level of inductive change; Yockey[17] has pointed out the analogy with Shannon's channel capacity theorem in communication theory[18]. Physiological ageing therefore is mainly a phenomenon of senescence. The small physiological impairment during induction should not be regarded as the cause of ageing during development in any direct sense; both are effects of the underlying sub-physiological change. The false assumptions (*a*) that all the injury produced by whole-body irradiation of an animal or by the simple passage of time can and must be expressed as physiological injury, (*b*) that this injury is proportional to dose or time, have caused much confusion in the discussion and quantitative analysis both of reparable and irreparable injury by radiation and of natural ageing.

There will be very little element of randomness in the overall production of intracellular change during induction in multi-cellular organisms in a given

Table 1. CHRONIC IRRADIATION OF *CBA* MICE FROM EARLY MATURITY (~ 80 DAYS) TO DEATH (ref. 30 and unpublished work by Neary, G. J., Hulse, E. V., and Mole, R. H.)

Last 70 per cent	*M*	*MST* *SD*	817 55	770 52	770 45	758 33	550 50	825 42	782 54	702 61	494 41	406 25
	F	*MST* *SD*	892 38	859 53	859 34	829 42	565 54	896 64	825 38	685 62	460 68	397 36

environment, but the effects of environmental stresses during development will be subject to random variation. The rate of development may depend more sensitively on individual characteristics than does the rate of induction, since it involves more complex levels of organization.

Intrinsic Ageing : Evidence from Irradiated Animals

Experiments at low dose-rates would seem to offer the best chance for detecting a non-specific speeding up of natural ageing by whole-body irradiation, because, for a given degree of life-shortening, repair mechanisms make the immediate physiological effects least under these conditions. Detailed data on mice irradiated continuously throughout life are available from two groups of workers. Lorenz and his colleagues at the National Cancer Institute in the United States[29] used gamma-rays to irradiate LAf_1 mice (first generation hybrids between two inbred strains, *C57L* females crossed with *A* males). The incidence of various pathological conditions at death was broadly similar in the irradiated and control animals, apart from some increase in tumours, particularly lymphomas. My colleagues and I (ref. 30, and Neary, G. J., Hulse, E. V., and Mole, R. H., unpublished work) irradiated *CBA* mice (an inbred strain) with fast neutrons or gamma rays. In our first experiment[30], the pathology at death was about the same in all groups and there was no clear-cut increase in overall incidence of tumours. In the second experiment the pathological findings have yet to be finally assessed (Hulse, E. V., and Mole, R. H., unpublished work). I have analysed the survival data from all these experiments on the working assumption that the principal effect of the radiation was a non-specific ageing.

The broad indications of data on non-specific life-shortening by radiation are that the *mean* shortening of life in a homogeneous group of animals increases with size of dose for a single exposure, or with size of *mean* accumulated dose for chronic exposure ; in either case, approximately proportional relations are found[4,31,32]. It has therefore usually been assumed that, with chronic irradiation continued until death, the shortening of life of an individual animal should depend on its particular accumulated dose ; thus a given dose-rate should produce the same proportional shortening of life in all the individuals. The cumulative mortality curve of an irradiated group would therefore be equivalent to that of the controls with the time axis contracted, and so the rate of ageing of the irradiated animals could be said to be accelerated compared with the controls ; the dispersion of life-times in an irradiated group would be reduced in proportion to the reduction of mean life-time. The LAf_1 mice of Lorenz *et al.*[29] conform fairly well to this simple picture, but our chronically irradiated *CBA* mice[30] do not show accelerated ageing in this sense. Instead, the cumulative mortality curve for an irradiated group corresponds to that of the controls with the time axis displaced, not contracted ; similarly, the Gompertz plots are displaced but the slopes are not increased by radiation. This result was described by the term 'premature ageing'[30], though 'premature senescence' is more explicit.

In terms of my model of ageing, chronic irradiation accelerates the basic sub-physiological process of ageing so that the duration of induction is shortened, but the ensuing development is almost unaffected by radiation at low dose-rates. It is assumed that *CBA* mice are sufficiently homogeneous genetically for the length of the natural induction period to be practically the same for all individuals, and that the dispersion of life-times arises chiefly from dispersion of length of development period, some of which at least is due to randomness in effects of environmental stress. When such mice are chronically irradiated, all individuals receive the same accumulated *effective* dose and all suffer the same shortening of the induction period. Development thus sets in prematurely, but at the same time for all, just as in the unirradiated animals. Thereafter, the probable course of events is the same for both groups ; for example, the shapes of the mortality curves, the slopes of the Gompertz plots and the dispersion of life-times will be identical apart from random variation. Attempts have been made to see whether these latter features, which I have found subjectively in the data, can be demonstrated or refuted on a firm basis of statistical significance, in order to decide between the alternative hypotheses of premature ageing (contraction of induction period only) and accelerated ageing (contraction of whole life-time). Some approximate arguments on the data of the first experiment alone supported premature ageing[30], but

Table 2. CHRONIC IRRADIATION OF LAf_1 MICE FROM EARLY MATURITY (~ 65 DAYS) TO DEATH (ref. 29)

Values of mean survival time (*MST*) and standard deviation of survival time (*SD*) in days for males and females combined, calculated for all animals in a group and for last 70 per cent of group

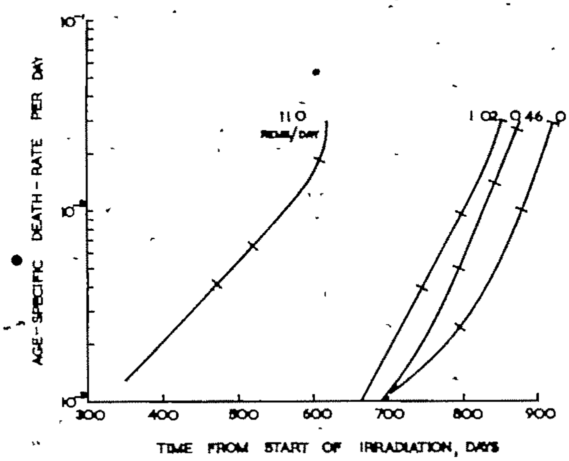

Fig. 2. Gompertz plots, *CBA* mice, females (ref. 30)

a more detailed examination of the data of both experiments suggests that they do not contradict either hypothesis at the 5 per cent level of significance (Neary, G. J., and Westgarth, D. R., unpublished work); or that neither hypothesis fits[33], though premature ageing is closer than accelerated ageing (Wise, M. E., unpublished work). Here, I shall merely present a summary of the data on mean survival-time and standard deviation of survival-time, together with graphs of the Gompertz plots with values of slope and doubling time. Some obvious differences between the *CBA* and LAf_1 mice are then apparent.

The dose-rate of all irradiated *CBA* groups has been expressed in rems/day, using the conversion factors 1 rad of cobalt-60 gamma radiation = 1 rem and 1 rad of our fast neutrons = 12 rems (determined from the intercomparison of life-shortening in our neutron and gamma groups (Neary, G. J., Hulse, E. V., and Mole, R. H., unpublished work). Doses for the LAf_1 mice were given in roentgens and the small difference for radium gamma-rays between rem and roentgen (= 0·98 rem) has been ignored here.

Certain facts stand out when Tables 1 and 2 are compared. First, the trend towards smaller standard deviation with increasing dose-rate and decreasing mean survival-time is much less marked for the *CBA* than for the LAf_1 mice. This point is shown more clearly by taking only the last 70 per cent of mice dying in a group, this being a very rough method of separating the mainly 'senescent' deaths from the mainly 'accidental' deaths (which incidentally may be shown to be far less affected by radiation in time of occurrence—data on first 30 per cent to die). Since for the LAf_1 mice the proportional reduction in standard deviation for a given dose-rate is at least as great as that in mean survival-time, it appears that, unlike the *CBA* mice, there is a considerable dispersion of induction-times, which is the main component in dispersion of total life-time. This conclusion is reinforced by the fact that the standard deviations for the LAf_1 mice are considerably larger than for the *CBA* mice, though their mean survival-times are somewhat smaller. Thus for life-time irradiation of LAf_1 mice at a given dose-rate, there is a considerable dispersion in accumulated effective dose. In fact, the individual effective doses are nearly proportional to the individual life-times, because, as shown below, induction comprises the greater part of the life-time; and so LAf_1 mice display a misleading appearance of simple accelerated ageing by radiation, that is, an apparent contraction of the whole life-time.

An examination of the Gompertz plots supports these conclusions and leads to some additional ones. From Figs. 1–5 and Tables 3 and 4 (refs. 13, 34) it may be seen (*a*) the Gompertz plots are not very linear; (*b*) with increase of dose-rate there is a trend towards steeper plots for the LAf_1, but not for the *CBA* mice up to ~ 15 rems/day; (*c*) for the unirradiated *CBA* mice the death-rates are generally greater and the Gompertz slopes steeper than for the unirradiated LAf_1 mice at a given level of cumulative mortality. If the usual interpretation of Gompertz slope as rate of ageing were accepted, these data would mean that irradiated *CBA* mice were ageing at the same rate as the controls, though their survival-time was nearly halved; and that the control *CBA* mice were ageing about five times faster than the control LAf_1 mice though they lived rather longer. The Gompertz plots for the two kinds of mice must therefore cross at some earlier time; and if each plot were extrapolated back linearly to the beginning, we should have the unlikely result that the initial death-rate of the LAf_1 mice would be some 10^3 times that of the *CBA* mice. In fact the plots do not continue straight very far backwards, and the slopes are smaller at earlier times.

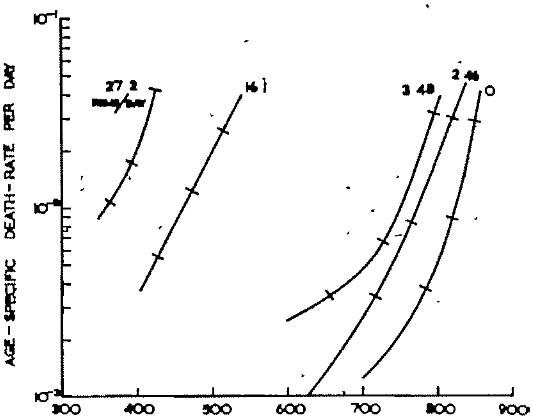

Fig. 3. Gompertz plots, *CBA* mice, males (Neary, G. J., Hulse, E. V., and Mole, R. H., unpublished work)

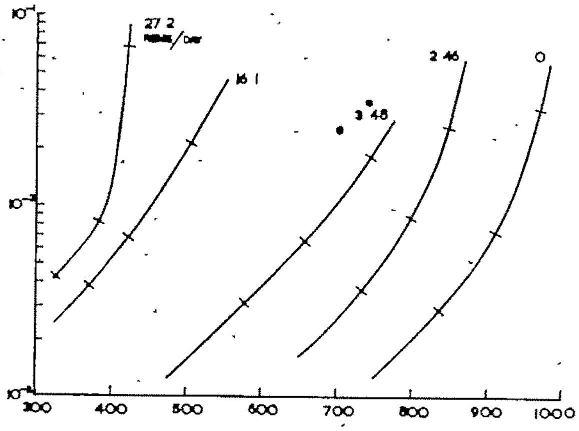

Fig. 4. Gompertz plots, *CBA* mice, females (Neary, G. J., Hulse, E. V., and Mole, R. H., unpublished work)

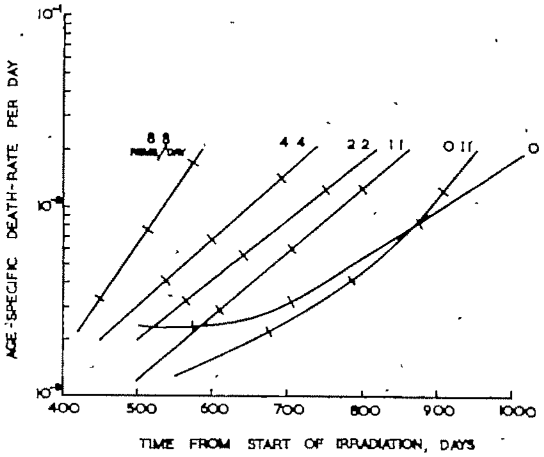

Fig. 5. Gompertz plots, LAf_1 mice, males and females combined (ref. 29)

These results provide no evidence for a process of physiological ageing proceeding at a roughly constant rate throughout most of adult life, as commonly postulated. In so far as the Gompertz slope measures rate of physiological ageing at all, this rate is much less before than during senescence, and the apparent rate before senescence is largely an artefact of the analysis due to 'accidents'. Moreover, it may be the exception rather than the rule for the innate variation between individuals to be small enough not to obscure such evidence of physiological ageing as might ideally be obtained from the dependence of death-rate on age in a uniform group. It is clear that the change in the Gompertz slope is unlikely to be a reliable index of ageing induced by radiation. When applied to the data on life-shortening in the LAf_1 mice, Failla and McClement[34] found it necessary to use the Gompertz relation in a formal sense only, as a mathematical transformation of basic data on mean survival-time. In *CBA* mice the Gompertz slope mainly reflects the rate of senescence, which is practically unchanged by life-time irradiation at low dose-rates; it tells nothing of the acceleration of the primary process of ageing during induction, which is responsible for the premature onset of senescence and for shortening of life.

The apparently much greater dispersion of induction times in the LAf_1 mice than in the *CBA* mice is unlikely to be due to an effect of differences in environmental conditions in the two laboratories, because afterwards a similar behaviour of the LAf_1 breed was found elsewhere[36,37]. Nor can the difference between the LAf_1 mice of Lorenz *et al.*[29] and our *CBA* mice be attributed to the pooling of survival data for LAf_1 males and females, since in the later work[36,37] the data for males and females are given separately. It may be that the considerable incidence of lymphomas in the control animals and its appreciable increase in the irradiated groups (up to 65 per cent in the females at 8·8 rems/day) is an indication that a particular pathological process rather than a non-specific ageing is responsible for the death of a good proportion of the mice. Brues and Sacher[38] observed an increase in the slope of the Gompertz plot for chronically irradiated female *CF* No. 1 mice, a breed usually showing a high incidence of mammary tumours. Alternatively, it is possible that there is a real dispersion of induction periods for non-specific ageing between individuals due to genetic causes, even though LAf_1 mice, being a first-generation cross between two inbred strains, would be expected to be genetically uniform. If the parent strains were absolutely uniform, then the f_1 cross would also be uniform; but if there were some variation in each parent strain, these variations would be combined multiplicatively in the f_1 cross. The possibility of a genetically determined difference in dispersion of induction times between LAf_1 and *CBA* mice thus involves the comparative genetic uniformity of the parent strains *C57L* and *A* and the *CBA* strain, and the influence of the factor of hybrid vigour.

Dose-response and the derivation of values for times of induction and development. I assume that a low dose-rate of radiation, r rems/day, produces the basic intracellular changes responsible for ageing, at a rate λr times the natural rate at any instant; the total instantaneous rate is thus multiplied by a factor $(1 + \lambda r)$. The accumulation of changed cells would be determined by the dynamics of the changed and normal cell populations; if there were competition between these cells, an alteration in the time required to attain a critical level of changed cells might depend in a complicated

way on an alteration in their rate of production[14]. Some model of the intercellular relationship is necessary in order to derive values for times of induction and development from the empirical data on life-shortening. In a number of possible models, an increase in the rate of production of changed cells from normal cells will result in a simple inverse contraction of the time required for the accumulation of a given level of changed cells. Since the critical level is assumed to be the same in irradiated and control animals at the ends of the respective induction periods, durations I and I_0, we have:

$$(1 + \lambda r)I = I_0$$

whence

$$(I_0 - I) = \lambda r I \qquad (2)$$

that is, the shortening of induction period $(I_0 - I)$ is proportional to the dose accumulated in the induction period, rI, the accumulated effective dose. The duration of the development period, D, is unaffected by radiation at low dose-rates and therefore the shortening $(S_0 - S)$ of life-time, S, is equal to $(I_0 - I)$, and so it too is proportional to accumulated effective dose. Time and radiation-dose are thus equivalent factors in ageing, and in this sense the dose-response is linear, although the proportion of cells changed is not necessarily a linear function of time or dose and the resulting physiological injury is probably a very non-linear function of these quantities.

The derivation of values for times of induction and development and the constant λ on the basis of the linear relation (2) for chronic irradiation is straightforward in principle, but with our data the accuracy of determination of development time is very low. Since by hypothesis $(I_0 - I) = (S_0 - S)$, we have $(S_0 - S)/r = \lambda I = \lambda(S - D)$; or, more generally, when irradiation starts at age T and continues until death:

$$(S_0 - S)/r = \lambda(S - T - D) \qquad (3)$$

A plot of mean values of $(S_0 - S)/r$ against mean values of time of survival $(S - T)$, for groups of animals at different dose-rates, r, should thus be a straight line with slope λ and intercept on the abscissa axis D, the mean development time. The data used in Figs. 6 and 7 are for the last 70 per cent of animals in a group to die, so as to reduce the influence of 'accidental' deaths. The values of D for males and females so obtained are in each case about 180 days. In this analysis any error of mean shortening of life or disturbance through side-effects is greatly exaggerated for the low dose-rate groups because of the divisor r in equation (3). Errors in r, the biologically effective dose-rate expressed in rems/day, can also seriously distort the graphs, and since fast neutrons and gamma-radiation were used, the values of r depend on the relative biological efficiency factor for the fast neutrons which the experiments were primarily designed to determine. It is thus not surprising that the spread of points is large in Figs. 6 and 7. If the same treatment is applied to the data on LAf_1 mice of Lorenz *et al.*[29] (males and females not given separately) or of Sacher, Grahn and Gurian[24] (survival data of last 70 per cent not given separately), the spread is too great to permit of any estimate of D. These difficulties should be reduced by using a fixed dose-rate and varying the age at which irradiation starts (Neary, G. J., and Mole, R. H., unpublished work). The estimate of D = 180 days agrees roughly with recent observations that for $BALB/c$ mice which received 500 r. at age 435 days, the age-specific death-rate became significantly greater than in controls only at age 575 days (average for males and females), that is, 160 days before the median life-span of the irradiated animals[19].

The best estimate of λ from our present data may be obtained from equation (2), which for animals starting irradiation at age T, may be written:

$$(S_0 - S) = \lambda r(S - T - D) \qquad (4)$$

By using the value of D obtained from Figs. 6 and 7, the mean accumulated effective doses, $r(S - T - D)$ for the groups at the different dose-rates may be calculated and used to make graphs of life-shortening against dose (Figs. 8 and 9). The values of λ given by the slopes are 0·065 day/rem for males and 0·086 day/rem for females, agreeing with other data on the life-shortening efficiency of chronic irradiation of mice[4,21,29].

Nature of the Induction Process and the Problem of Extrapolation between Species

The linear form of the dose-response for non-specific life-shortening by radiation at low dose-rates is consistent with a cumulative injury due to irreversible

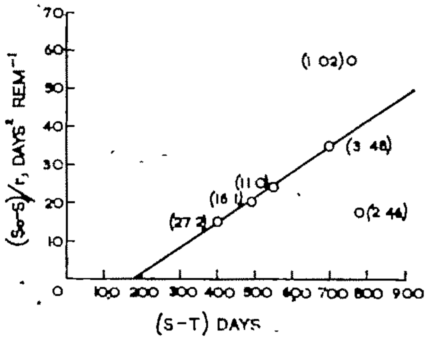

Fig. 6. *CBA* mice, males. Numbers in brackets are daily dose rates. The intercept is the mean development time (see equation 3)

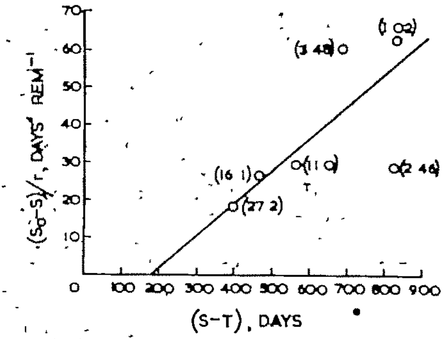

Fig. 7. *CBA* mice, females. Numbers in brackets are daily dose-rates. The intercept is the mean development time (see equation 3)

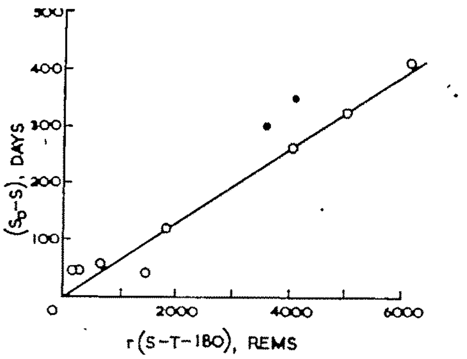

Fig. 8. *CBA* mice, males. Life-shortening against mean accumulated effective dose (see equation 4)

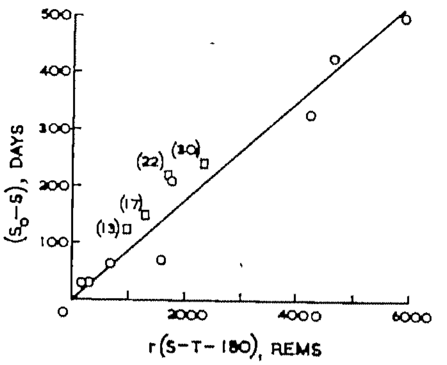

Fig. 9. *CBA* mice, females. Life-shortening against mean accumulated effective dose (see equation 4)
○, life-time irradiation; ⊡, irradiation for limited periods of weeks shown in brackets

changes in cells. This is in marked contrast with the short-term physiological injury, for which there is a very non-linear dose-response and a recovery process with a time-scale measured in days or weeks[8]. The linear relation implies that a given increment of dose would have the same effect at any time up to the completion of induction. This is confirmed approximately in the similar degrees of life-shortening produced by single, fractionated and life-time doses of fast neutrons[32,40]. Some results on our female *CBA* mice given chronic irradiation for limited periods[33] have been included in Fig. 9, and they agree fairly well with the results for life-time irradiation, considering that the animals in most of the limited irradiation groups, unlike those in the life-time groups, were used for breeding experiments. The linearity with life-time irradiation, however, may result from a precarious balance in the intercellular dynamics; if so, the balance might well be upset by a sudden fall in production of changed cells on cessation of radiation. The linearity and independence of age inferred from life-time irradiation and single-dose data could therefore not necessarily be expected for other regimes of irradiation in which, moreover, specific disease processes might assume greater importance.

Although there is approximate independence of the timing of the dose for fast neutrons, this is not the case with *X*- or gamma-radiation, single doses of which are some three times as efficient as doses spread over the whole life-time, though in each case the dose-response is approximately linear[4,31,32]. If the greater life-shortening efficiency of single doses is attributed to a greater efficiency of production of the primary intracellular change, and if the dose-response is indeed linear, then it is difficult to equate the intracellular change with chromosome structural damage[13,14], because the only types of such damage which are produced more efficiently by single doses than by protracted doses have a considerable square-law component in their dose-response[41]. These arise from the interaction of two independently produced sites of potential damage, each with a limited life-time, usually of the order of an hour. The linearity of the life-shortening dose-response for small single doses is somewhat uncertain owing to the low accuracy of the data. It has been shown, however, that the life-shortening effect of a single dose of X- or gamma-radiation is no greater than if the same total dose is delivered in two discrete fractions with intervals of as much as a month between them (Sacher, G. A., personal communication); there is no evidence with the single dose of the interaction that would be expected if 'two-hit' chromosome structural damage were important. Similarly, the relative biological efficiency for life-shortening of fast neutrons compared with X- or gamma-radiation does not increase if the dose is given in several fractions, provided the dose-rate during the actual irradiations is the same[40b,43]. These results suggest that the greater life-shortening efficiency of single doses of X- or gamma-radiation compared with chronic low dose-rates is a dose-rate phenomenon perhaps comparable with the dose-rate effect for mutations in mice[42]. If the primary intracellular process responsible for life-shortening is dependent upon dose-rate, then it cannot be equated with 'one-hit' chromosome structural damage[41]. On the other hand, fractionation of X-ray dose without change of dose-rate has in some experiments produced a decreased efficiency of life-shortening, either in absolute terms[44] or relative to the fast-neutron effect[45]. It is known for cells generally that there are qualitative differences in the spectrum of chromosomal changes produced by single and protracted doses of X- or gamma-radiation or by single doses of different magnitudes, owing to the dependence of the 'two-hit' component on time of exposure and square of the dose. These differences might lead to differences in the ensuing intercellular dynamics, which might help to account for some of the facts observed. In general, however, the influence of possible specific disease processes requires more detailed examination[46]. Thus the possibility that the primary intracellular change is one of chromosomal structural damage cannot be ruled out.

The simpler formal model that the intracellular change responsible for ageing is gene mutation[16,17] offers no simple explanation of a possible dose-rate effect for X- or gamma-radiation, or for the large size of the 'doubling dose'. A chronic dose-rate of about 13 rems/day is required to double the rate of ageing in mice[35], so that the doubling dose per life-time is around 5,000 rems or 1,500 rems as a single dose, which as Strehler[15] points out is about 25 times larger than the genetic doubling dose. It may be that the site damaged is not part of a chromosome at all; ageing in some organisms seems to be primarily a cytoplasmic phenomenon[47].

The bearing of the evidence on the relative biological efficiency of fast neutrons compared with X- or gamma-radiation for life-shortening on the nature of the intracellular change is ambiguous. The relative biological efficiency for single doses[40] is around 2, and for chronic doses[31,32] around 10. Data on the relative biological efficiency for point mutations are not available for mouse cells. Early work on mutations in *Drosophila*[41] gave values of about 1 with single doses, but more recently values near 2 have been found[42]. The relative biological efficiency of single doses of fast neutrons for chromosome damage depends on dose-level and the particular type of damage.

Examples of possible consequences of cell-change which would be relevant to ageing are: (*a*) death of non-replaceable cells; (*b*) reduced competence for particular functions; (*c*) auto-immune reactions between changed and normal cells or between changed cells themselves. Burnet[43] has suggested that ageing may be an auto-immune reaction, and this may perhaps be the essential character of what is here described as development, and most of the cells of the animal may be involved. The cells changed by the induction process may comprise all the cells, or only some particular class of cells. If induction is a process of destruction of a special class of cells, they might correspond to the homœostatic systems postulated by Burnet[44], damage to which beyond a certain level unleashes an uncontrollable chaos of reactions from spontaneous auto-immunity leading to physiological deterioration and finally death.

The idea of ageing as a gradual increase in entropy was early suggested by Perks[45], and more recently formal treatments have been given in terms of information theory[17,46]. The precise meaning of the formalism is not always clear, however; for example, How much of the information in the organism is intracellular and how much intercellular? Would an idealized point mutation in a cell reduce the information of that cell, or is it more important that the cell is now different from its fellows? The incompletely explored distinction between information entropy of form and of function[47] would seem to be important for this question. The loss of information by the whole organism caused by time and chronic radiation may be formally represented:

$$H_0 - f[(1 + \lambda r)t] = H_1 \qquad (5)$$

where H_0 is the initial level of information and H_1 the final level. H_1 is usually interpreted as the value at death, but in my model would be the value at the end of induction. Yockey[17] regards the difference of life-span between individuals as due to genetic differences in the initial level of information and assumes a fixed value for the final critical level.

If, however, loss of information due to induced differences between cells were the important process, so that because of the initial identity of the cells in a given individual all individuals initially contained the same amount of information H_0, the individual variation might be associated with the final level, H_1. That is, there would be individual differences, genetically determined, in the amount of cellular disorder which could be tolerated. This possibility is considered by Quastler[48] and Szilard[18]. There is a third possibility, that individual variation is associated with the term in equation 5 which expresses the effect of time and radiation in reducing information. This is ruled out, so far as radiation is concerned, by the fact that a single dose of radiation produces a uniform shortening of life even though there may be dispersion of induction times; for example, the shortening of life by a single dose in LAf_1 mice is the same in the long-lived as in the short-lived individuals[19,49]. The assumption that individual differences are associated with the final rather than the initial level of information is in harmony with the idea of an increasing divergence between cells leading to auto-immune conflict.

Extrapolation between species for shortening of life by irradiation. There are several difficulties about extrapolating shortening of life by irradiation between species, even if it be accepted that the postulated intrinsic ageing process is the same in different species. In general, the relative importance of this process and the 'accidents' in determining the natural life-time is unknown. Further, for any radiation condition other than very low dose-rates, highly specific processes may be important; even for low dose-rates there have been reports of a prolongation of mean life-time relative to controls[13,49,50].

Boche[51] first suggested that a given dose produced the same proportional life-shortening in different species. This hypothesis has been used as the basis of most attempts to derive the shortening of life per unit dose in man from data on laboratory animals, leading to values from 1 to 15 days per roentgen (or per rem)[24,25,52]. In the present model, however, the shortening of life per rem, λ, is the ratio of 'mutation'-rate per unit time produced by unit dose-rate to that occurring naturally. There seems to be no compelling *a priori* reason why this ratio should increase in proportion to natural life-span, only a loose analogy from the approximate constancy of doubling dose per generation for genetic effects. In organisms as biologically similar as mice and men, it is conceivable that the value of this ratio might be the same, in which case the *absolute* shortening of life per unit dose would be the same, namely, about 0·08 day per rem of chronic radiation. A radiation worker, for example, who accumulated the maximum permissible life-time dose of 200 rems would then suffer a shortening of life of 16 days, instead of a figure of the order of a year derived on the alternative assumption. It is of interest that the life expectation of radiologists does not seem to have been significantly reduced by their exposure to radiation[53].

COMBUSTION AND PROPULSION

HIGH MACH NUMBER AIR-BREATHING ENGINES

THE Advisory Group for Aeronautical Research and Development, familiarly known as AGARD to aeronautical scientists, is both the concept and the achievement of one man—eminent mathematician in the field of aeronautics for so long as to have become almost legendary. Theodore von Kármán saw the need immediately after the Second World War for some organization in Europe to re-create the aeronautical strength of those countries which had been prevented from working in the field, and had, indeed, been largely isolated from the very rapid development which had then taken place during the War.

It was clear that such an organization had to be under the general sponsorship of NATO; but the orthodox solution of an international body composed largely of officials and the military was not what von Kármán desired. Instead, he created what was for all practical purposes an international learned society, having the great advantage of being supported financially by a military treaty organization; although depending upon that support, von Kármán has always insisted on an administrative autonomy for AGARD, which has been largely responsible for its scientific independence and quality. He became its first chairman and has been unanimously re-elected to that post each year since.

AGARD held its fourth Combustion and Propulsion Colloquium, on "High Mach Number Air-breathing Engines", in Milan during April 4–8. Appropriately enough, the sessions were held in the Museum of Science and Technology erected to the memory of that illustrious and most famous citizen of Milan, Leonardo da Vinci; so, surrounded by copies of diagrams from the master's sketch book and working models which showed he had, in any event, considered these problems ages ago, some three hundred and seventy scientists from most of the free European nations, the United States and Canada met for discussion. The team from the United States was extremely strong, and, as would be expected, made the largest and most vigorous scientific contributions, undoubtedly due, in part, to a very liberal interpretation of the security regulations by the American authorities.

The choice of the subject of high-speed, air-breathing engines, in the current fashion for space science, is possibly unusual. In the United States it appears that official support for research into air-breathing engines has largely been terminated in favour of the extensive programmes of rocket research and development for space exploration. The gigantic air-supplying plants at the experimental establishments of the National Aeronautical and Space Agency and the U.S. Air Force which were originally built for gas turbine and ram-jet research have been almost entirely converted into test facilities for rocket research.

It became clear in the opening speeches of the colloquium that the above state of affairs was causing a good deal of concern in many scientific quarters in the United States. Indeed, the first four papers, all by Americans, were in the nature of both an apologia and an explanation for the choice of subject. Von Kármán, in his opening address as chairman, pointed out that although one of the first to advocate the missile and rocket applications to flight, he now felt that the very enthusiasm with which this challenging branch of science and technology had been taken up was causing an unbalanced programme of research and development. He said that it was not unreasonable to expect that, considering the limitations of human physiology, the urge for yet faster manned flight through the atmosphere would be more attractive and more useful than a few space explorations using ion or plasma engines utilizing nuclear power and lasting for several years.

At present, military manned aircraft fly at twice the speed of sound, and engineers are considering seriously the building of civil airliners which will cruise at least as fast. Well-behaved missiles cruise at Mach 10–20, and von Kármán felt that it was in the intermediate range of Mach 3–10 that useful developments could take place, but only if really serious scientific effort was applied to the many research problems involved.

On the military side, von Kármán said that he strongly suspected that future study of the problems would show that the role of manned aircraft was, as yet, far from being terminated and that the development of vertical take-off techniques would broaden even further the usefulness of very high performance aircraft using air-breathing engines.

In the second paper of the opening session, Admiral J. T. Hayward, the only military speaker, who is deputy chief of development, U.S. Department of Navy, supported the same view, pointing out "the advantages of using an oxidizer, which is there for the asking". He went on to describe certain broad fields of military applications of very high speed, air-breathing engines both in missiles and manned aircraft.

Both the first two speakers said that developments of the ram-jet engine appeared to be the likely solution at speeds between Mach 5 and 8, although the disadvantage of this type of engine in having no static thrust and hence having to depend upon some other form of propulsion for take-off was stressed by Admiral Hayward.

The rest of the programme did indeed concentrate upon the problems of ram jets, apart from one session devoted to turbo-machinery. Before this, however, there were two more introductory papers by Prof. A. Ferri, of Brooklyn Polytechnic, and by M. A. Zipkin and L. M. Nucci, of the General Electric Co., which were devoted to somewhat superficial parametric studies of the different applications of ram jets in both the manned and missile fields, which the authors thought would be important in the future.

Ferri pointed out that in certain applications an air-breathing machine is the only practical solution, while in others it is an alternative to the rocket. In the former category he placed transportation and tactical warfare and in the latter a number of missile applications.

In the case of transportation, Ferri said that increase of flight speed not only decreased transit time but it also increased the range of an aeroplane. He pointed out that a great many of the major cities of the world were about 5,000 miles apart, and an aeroplane with such a range would be commercially attractive. It could only be attained economically by flying at Mach numbers of 4–8 rather than 2 or 3 and would use ram-jet engines for cruise, and turbo-jet engines designed essentially for the accelerating phases.

He also described a system for placing a large payload into orbit; and then landing without damage. Such a vehicle would take off like an aeroplane using turbo-jet engines, accelerate gently to orbital speed under full control in time and position, using ram-jet engines with subsonic burning in the lower range of supersonic flight, but at hypersonic speeds the internal flow in the combustion chambers would be supersonic. Such a vehicle would weigh between 130,000 and 400,000 lb. at take-off and could place a payload of 10,000 lb. in orbit. Although requiring much basic research, Prof. Ferri felt such a vehicle would be far more efficient and far more useful than present solutions based entirely on very large rocket motors. He made a strong plea for a small but continuing research effort in the air-breathing engine field, pointing out that if not, the existing technological ability and scientific background accumulated in many years of work would be lost. He considered that a resumption of such work at a much later date would necessitate a far larger effort.

Zipkin and Nucci elaborated the theme of composite, air-breathing systems, reviewing the performance characteristics of present engines and the trends of improvements in future engines. Performance figures from this work were then used to study a number of applications.

The first was the use of an accelerating air-breathing first stage for launching satellites or sounding rockets. In these systems, the launching vehicle might be a supersonic fighter or other very high performance aeroplane which would release the final rocket stage at 60,000–80,000 ft. Such systems, on the authors' assumptions, showed gains of as much as 60 per cent in the ratio of orbital weight to take-off weight, as compared with two-stage rocket systems. It is worth noting that the launching structure weight is much higher in the former case, but since the launcher is not expendable, a net saving in cost should ensue if the number of launchings was high enough, together with a much greater flexibility of operation since satellite launching programmes could be undertaken from conventional airports. This, in itself, would also lead to a much greater choice of initial orbit inclinations.

The second system studied by Zipkin and Nucci was a composite supersonic transport, capable of transporting sixty passengers 3,500 miles at Mach 4. Again, there were two stages and, as would be expected, the staged system was about two-thirds the weight of a single aeroplane, and less fuel was consumed by the former. This is not a convincing example, since a similar, if less strong, argument for staging can be applied to present subsonic transports, again with similar performance gains. In fact, such systems have been tried (for example, the Mayo composite aircraft), but have never been attractive to operators because of the much greater capital and maintenance costs, and of the difficulties of operation.

The main part of the colloquium dealt with the research necessary to develop ram jets up to hypersonic speeds between Mach 4 and 10. Essentially, a ram-jet engine consists of three components, namely, an air intake, a combustion zone and an exit nozzle. Air must be efficiently decelerated and compressed in the intake, then energy added by burning fuel in the air stream and finally the heated gas is accelerated and expanded to ambient pressure. At speeds of around Mach 3–4 such processes are reasonably straightforward, although, since most of the work takes place in the intake and exit nozzles, ram jets are extremely sensitive to exact matching of the three components, otherwise useful thrust (that is, thrust greater than drag) will not result.

As speeds increase into the hypersonic regions, the difficulties increase greatly. In the first place, the stagnation temperatures at hypersonic speeds are very high (around 5,000° R at Mach 8), even though the ambient temperature of the air is that associated with the stratosphere. There appears to be, indeed, a propulsion 'corridor', to high performance which relates altitude and Mach number, and bordered on one hand by maximum stagnation temperature and maximum internal working pressure, and on the other by minimum pressure for combustion. While much can be done to alleviate the temperature problem by radiation cooling and by using the evaporation of the fuel, there remain extremely serious material problems which were discussed at a later session of the colloquium. It is of interest to note that there is the possibility of compressing the air externally under a hypersonic wing, and spraying fuel into the decelerated flow. In other words, the ram jet can possibly be turned inside out with a very great gain of radiation cooling.

The design of an efficient air intake for one particular hypersonic speed is not difficult. However, in any practical ram jet the efficiency must remain high over the wide range of speeds and altitudes through which the engine accelerates to the cruise condition. This necessitates great variations in the shape and area of the intake. Ideally, a continuous variation is required, but, in general, the weight involved forces compromise solutions.

In all current ram jets and turbo jets, the air is decelerated in the intake to subsonic speed; but in the case of the hypersonic ram jet the problem of the intake would be eased if only partial deceleration took place. This, however, throws a greater burden on the design of the combustion chamber since little is known about stable combustion in a supersonic air stream.

It is of interest to note that, at hypersonic speeds, kinetic energy recovery is a more convenient way of expressing the adiabatic efficiency of an intake rather than the pressure recovery ratio used at lower speeds.

Finally, the exit nozzle has also to be designed to deal with the same wide range of Mach numbers and altitude as the intake, and consequently variable geometry is once more necessary. There are, however, two additional difficulties: first, the extremely high gas temperatures severely limit mechanical solutions. The second difficulty is of a more fundamental nature. The transit time of the air through the engine is of a similar order to the recombination times of the dissociated products of combustion. At present there is a great deal of uncertainty as to the amount of recombination which takes place before the hot gases leave the nozzle, the difference between the thrust of the equilibrium flow and the 'frozen' flow thrust of complete dissociation being enough to rule out the latter as leading to a useful engine with a thrust greater than its drag.

It will be seen, therefore, that the development of air-breathing engines for hypersonic propulsion throws open new fields of research, both in gas-dynamics and thermodynamics, which are likely to be very fruitful. The authors of the papers which followed had accepted this challenge, and presented a great deal of new and valuable work, none the less interesting because of its controversial nature. Indeed, the discussions, which at conferences of this nature are not usually very stimulating, were on occasion extremely brisk.

Both J. A. Drake and C. L. Dugger, of Johns Hopkins University, presented papers dealing with the ram jet as an entity. The former especially stressed the need for additional research effort in the determination of exhaust nozzle recombination rates. Dugger's paper consisted of a theoretical comparison of hypersonic ram jets with subsonic and supersonic combustion. His calculations assumed that stable combustion can be achieved in supersonic flow, an assumption which is open to some doubt on present evidence.

On the basis of equilibrium flow, Dugger predicts that a significantly better performance can be achieved with supersonic combustion than with subsonic at speeds in the Mach 8–10 range; in addition, lower combustion chamber pressures and temperatures may ease the design problems. However, making further assumptions about the degree of recombination, he showed that when kerosene is the fuel, the supersonic combustion chamber must be operated at pressures almost the same as in the subsonic case in order to achieve reasonable performance.

The next session was devoted to two papers by J. F. Connors and L. J. Oberry, of the National Aeronautical and Space Agency, and G. H. McLafferty, of United Aircraft, describing basic studies on air intakes. Intakes with both internal and external compression were examined and the great importance of variable geometry in both cases was emphasized. It was also shown that difficult viscous effects will be present which will necessitate complicated boundary layer control devices for maximum performance.

In logical order, the following sessions were devoted to combustion problems and to investigations of the reactions taking place in exit nozzles.

H. Behrens and F. Roessler, of the historic rocket establishment at Saint Louis, which is now under combined French and German direction, described some elegant experiments with supersonic diffusion flames, obtained by passing a supersonic jet of the hot, but not fully oxidized, gases from a solid rocket into air or oxygen. It was shown that with propellants of high heat of explosion stable flames were produced with no ignition delay at the first shock of the jet, while with propellants of low heats of explosion, ignition occurred with a delay, behind the first shock. The latter flames became unstable as the heat of explosion of the rocket propellant became less, although a greater stability was achieved with pure oxygen than with air.

P. P. Wegener, of the Jet Propulsion Laboratory, California Institute of Technology, chose the simpler and better-known system of a reacting mixture of nitrogen tetroxide and dioxide carried through a supersonic nozzle with a stream of nitrogen. By choice of conditions flows which were either in chemical equilibrium or in states between equilibrium and 'frozen' flow could be obtained, the recombination co-efficients being determined from optical absorption or static pressure measurements. As was pointed out in the discussion by K. N. C. Bray, of the University of Southampton, these experiments gave excellent agreement with his own theoretical predictions about non-equilibrium flows through supersonic nozzles and shock-waves.

E. A. Lezberg and R. B. Lancashire, of the National Aeronautical and Space Agency Lewis Research Centre at Cleveland, Ohio, described similar nozzle investigations on a much larger scale using hydrogen/air mixtures. In this case the rate of recombination of the dissociated products of combustion was derived indirectly from performance calculations based upon static pressure and temperature measurements. The results indicated that although deviations from equilibrium flow occur downstream of the nozzle throat, recombination may be occurring throughout the length of the nozzle.

A further paper in the combustion series was a distinguished contribution by A. K. Oppenheim and P. A. Stern, of the University of California, in which the applicability of detonation wave studies to hypersonic combustion was investigated. The authors pointed out that the very stability of a detonation wave makes possible very precise observation and measurement, which could lead to an understanding of many of the problems in a ram jet, such as, for example, the propagation of non-equilibrium disturbances through compressible and reactive gaseous mixtures.

Detonation waves discovered by the early classical work of Berthelot Le Chatelier and others were studied from a thermodynamic point of view by D. L. Chapman and E. Jouget around the turn of the century. These workers demonstrated that detonation waves are complicated systems of shock waves followed immediately by deflagration; and later work, by means of more sophisticated instrumentation, has enabled the structure of the wavefront to be examined in much greater detail. It is clear that the team at the University of California has made great advances in this fascinating field of thermodynamics.

Not the least useful part of the paper by Oppenheim and Stern was the historical review of earlier work on detonations and explosions, together with more than two hundred references to other published work. The paper may well, therefore, become a standard reference in this field.

Following these papers on thermodynamics was the only paper on gas-turbine engines, somewhat out of context, since the speed-range considered was only up to Mach 3, and somewhat unfortunate in that it was one of the only two British papers. Nevertheless, it did reflect the emphasis in Britain of the continued importance of the lower Mach number range. Prof. J. H. Horlock, of the University of Liverpool, presented a very interesting paper on the research in turbomachinery which was still essential for the development of gas turbines capable of propelling aircraft at speeds up to Mach 3. He reviewed the current work on component efficiency, stability of compressors, blade cooling and maldistribution in the intake and compressor, all fields in which he considered there remained many problems requiring fundamental research.

Curiously, no mention was made of combustion problems which are certainly not well understood at Mach 3, nor was there any reference to the great difficulty of dealing with the noise caused by such engines, which may be a dominating factor in the choice of efflux velocity and relative mass flow.

Again, this paper contained a very useful list of nearly sixty references to the published literature.

Finally, the last session was devoted to the materials problems raised by the very high temperatures of hypersonic air-breathing engines. Papers were presented by A. J. Murphy and A. J. Kennedy, of the College of Aeronautics, Cranfield, and by P. Duwez, which were remarkable for their similarity of thought —indeed, each contained an identical diagram relating activation energies for creep, stress rupture and self-diffusion with melting temperature. Working on these lines, but also grading on a basis of low density and high elastic modulus, the advantages of tungsten, molybdenum, chromium and beryllium as refractory materials were stated. Duwez pointed out that since ram jets were constructed mainly from sheet, metals were more attractive than cermets or ceramics; but Murphy and Kennedy stressed the surface reactivity of such metals and the need for research in surface protective methods. Both papers also referred to the use of graphite, with its very high sublimation temperature and its unusual property of increasing tensile strength with temperature up to about 2,500° C.

Duwez, however, considered that materials research would not provide the entire answer to these high-temperature problems, and that porous wall cooling and ablation would be the ultimate solution for very high combustion temperatures. In the ensuing discussion, it was generally felt that the ultimate limit was likely to be an economic one.

So came to an end an extremely useful and fruitful colloquium, which provided an excellent forum for vigorous discussions in a relatively new field of applied science. As is general with AGARD meetings, the contribution of the American workers was both massive and excellent. Unusual, however, was the rather small contribution from Great Britain, the representatives of which were, in general, in the position of assimilating, rather than contributing, new information.

W. CAWOOD

THE PLANT PATHOLOGY LABORATORY, HARPENDEN

By W. C. MOORE, C.B.E.

THE Minister of Agriculture, Fisheries and Food, the Right Hon. John Hare, formally opened the new buildings of the Plant Pathology Laboratory at Hatching Green, Harpenden, on May 13, in the presence of more than a hundred distinguished guests and a staff of nearly sixty. The Minister recalled that the Laboratory, familiarly known for years as "Path. Lab.", was one of the oldest scientific sections of the Ministry. It was founded in 1918 at the Royal Botanic Gardens, Kew, and three years later was transferred to a converted private house in Harpenden. During the next twenty years it had consolidated its position as a scientific liaison centre and a source of advice on all aspects of plant diseases and pests. The big development of the Laboratory had come in the past two decades along with advances in the study of crop protection. The Second World War had again focused attention on maximum food production, and with the need to cut down losses from diseases and pests the Laboratory became an impor-

R 321

tant link in the complex relations which exist to-day between science, industry and the farmer. A private house was well enough with a staff of ten; but it became more and more inadequate as the work and staff increased. By 1955 the problem of accommodation had become acute. It was then that the Lawes Agricultural Trust purchased and leased to the Ministry of Works a site of nearly six acres on which a new Laboratory could be built, and during the period of construction it provided temporary accommodation for a substantial part of the overcrowded staff.

The new building lies on the periphery of the Rothamsted Experimental Station campus and its design is well adapted to the functions of the Laboratory, which are essentially still of a liaison nature. For example, the Laboratory co-ordinates a system of intelligence, survey and forecasting work on plant diseases and pests, and this involves almost daily contact with the regional plant pathologists and entomologists of the National Agricultural Advisory Service. It provides the scientific basis for the administration of regulatory work involved in the import and export of plants, in the internal spread of dangerous plant diseases and pests, and in official crop certification schemes for potatoes, fruit and hops, all of which is done in the closest collaboration with the Ministry's Plant Health Branch, the National Agricultural Advisory Service, and the Plant Health Inspectorate. It also works closely with the chemical industry in so far as it acts as a clearing house for information on the toxicity of insecticides, fungicides and herbicides to man, animal and plant, and houses an Agricultural Chemicals Approval Organization recently set up to grant official approval to biologically efficient proprietary chemicals used in crop protection, and to replace a somewhat similar scheme that had been in operation for nearly twenty years. The Laboratory also prepares and keeps under regular revision the Ministry's advisory leaflets and bulletins on common diseases and pests of plants, edits its own quarterly journal, *Plant Pathology*, and carries out research on problems arising out of administration. Collaboration in the work of inter-governmental organizations such as the European and Mediterranean Plant Protection Organization, the Western European Union and the Food and Agriculture Organization has become an important feature of its activities during the past decade.

The new building does little more than accommodate the present staff of sixty, including thirty-five plant pathologists, entomologists and chemists; but its construction and L-shaped design are such as to allow for ready expansion. The spacious entrance hall gives access to two corridors along which the laboratories and offices for plant pathology and crop protection chemistry are arranged on either side. The third department, for agricultural entomology, and the library are on the first floor above plant pathology. The chemistry wing has a flat re-inforced roof to allow for first-floor extension. About thirty of the rooms are designed to serve the double purpose of office and laboratory. In addition, there are two chemistry research laboratories, three air-conditioned rooms and a laboratory for experimental work on fumigation, separate laboratories for mycology, nematology and bacteriology (including the housing of the National Collection of Plant Pathogenic Bacteria), a combined conference and training room, photographic department, library, insect museum, general office, and workshop.

The two chemistry laboratories are identical in design, and are intended for the chemical evaluation of formulations in one, and of pesticide residues on crops in the other. To save wall space each is virtually divided into two by a central peninsula of four fume cupboards equipped with separate speed-controlled exhaust fans and external air intake fans, thus avoiding warm air being sucked out of the room. Titration benches and laboratory scaffolding with lateral service panels occupy the ends of each laboratory. Hot and cold water, electricity, gas, vacuum, compressed air, distilled water, carbon dioxide and nitrogen supplies are fed to the working benches and units from a service duct under the central corridor. Between the two laboratories are the balance and electrical equipment rooms housing a spectrophotometer and allied instruments. There is also a general purpose chemical laboratory containing large apparatus, such as a centrifuge and a deep freeze, and provided with fixed service panels and mobile benches to allow flexibility of arrangement.

Techniques for controlling pests on planting material either imported or destined for export will be studied in a new fumigation section, starting with methyl bromide fumigation of seeds and continuing with the effect of fumigants on a number of pests and plant species. A large general-purpose laboratory is intended to be used for gas analysis studies and for the biological aspects of the work. In the three air-conditioned rooms temperatures can be controlled between 5° and 30° C., and high relative humidities can be maintained, in order to be able to simulate some of the conditions which obtain during practical plant quarantine work. One room will house a 1.500-litre steel fumigation chamber for plant toxicity studies and for work on vacuum fumigation techniques, while the other two will be used for small-scale studies on the sorption of fumigants by seeds and for the rearing of insect pests.

Ancillary buildings adjoin the main laboratory. The glasshouse block includes insectaries, glasshouses of a total area of 2,000 sq. ft. divided into a number of isolated compartments, a small laboratory for plant inoculations, and a working area with potting bench, etc. Ventilators are protected by removable metal gauze panels, so that any compartment can be made aphid proof. The virus disease section has additional forced fan ventilation. The bench tops are concrete troughs so that the plants can be watered by sub-irrigation. The glasshouses are heated by small-bore hot-water pipes and auxiliary electric fan heaters, both thermostatically controlled; and there are facilities for supplementary lighting when required.

The ancillary buildings also include a room specially designed for washing soil samples to determine pest populations of soils, and a pest assessment sample room equipped to deal annually with large numbers of experimental yield samples of cereals and forage crops. A small, unique, electrically driven, highly versatile, loss-free threshing machine, designed and built at the National Institute of Agricultural Engineering, has been installed along with other equipment, including a sample dryer which can deal with wet samples before threshing as well as grain after threshing, and a modified small commercial grain cleaner.

OBITUARIES

Mr. H. W. Robinson

H. W. Robinson, who died suddenly on April 22, was a familiar and much-consulted figure in the Library of the Royal Society, with which his association was so long, so close and so valuable that the loss seems irreparable. He was born on March 23, 1888, in Wood Green, a part of London with which he was closely associated all his life, being in many ways a prominent local figure, held in affectionate regard by the residents. He joined the staff of the Royal Society in 1902, as a boy of fourteen, and soon became particularly associated with the Library, of which he was appointed assistant librarian in 1930 and librarian in 1935. When, at the age of sixty, he retired from this post, his services were retained by the Society to assist in editing the Newton correspondence, of which, happily, he was spared to see the appearance, some months ago, of the first of the seven volumes that are anticipated. With this work, to which his contributions were a model of clarity and accuracy, he was prominently associated until the day of his death.

Robinson took an enthusiastic interest in everything to do with the Royal Society's Library and with its extensive and invaluable archives. He was a self-taught scholar of considerable attainments, whose specialized acquaintance with many branches of the history of science was remarkable. He was always ready to place this exceptional knowledge, which included the whereabouts of rare books and manuscripts other than those in the Society's possession, at the disposal of students of the history of science, including many from abroad who made use of the Library, and frank acknowledgments of his generous and valuable aid are to be found in many important publications. With Prof. Harcourt Brown and Prof. D. M. McKie he founded the *Annals of Science* and he took a prominent part in founding the British Society for the History of Science.

He was particularly well acquainted with the events of the early days of the Royal Society. He had, for example, made a particular study of Robert Hooke: he identified as written by Hooke the diary in the British Museum that had always been attributed to James Petiver, and, in conjunction with Walter Adams, he edited the "Diary of Robert Hooke", in the possession of Guildhall Library, which was published in 1935. Reference has already been made to his exceptional knowledge of the correspondence of Newton and his contemporaries.

Robinson was a most friendly man, who knew his own mind and inspired confidence. He was devoted to the Royal Society, which he served for fifty-eight years, and the Society repaid his devotion with a warm regard and a respect for his specialized knowledge and achievements. He was very happy when his son Norman was appointed assistant librarian to the Royal Society, thus continuing the association which Robinson himself so long represented.

E. N. da C. Andrade

Mr. J. R. MacCabe

Jack R. MacCabe, a familiar figure to the many visitors to the European Organization for Nuclear Research, died on April 17.

Born at Edmonton, Canada, on May 4, 1914, he entered the University of Alberta in 1930. Two years later, he went to McGill University, Montreal, where, by 1937, he had taken his degrees of bachelor of science and master of science (natural sciences), while working as a demonstrator and lecturer in physiology at the University's Faculty of Medicine.

Jack MacCabe went to Europe soon after finishing at McGill and continued medical and biological studies and research at the University of Munich, up to the outbreak of the Second World War in 1939. When he arrived in Switzerland, he found a position as a lecturer at the International School and at the

Interpreters' School of the University of Geneva, where he remained until 1944. In the meantime, in 1942, he had joined the staff of the well-known aviation magazine *Interavia* and, in 1951, became executive editor of its "Air Letter".

In September 1955, he joined CERN (European Organization for Nuclear Research) and eventually became senior information officer. His considerable energy and intelligence were used to good purpose in meeting the thirst of the informed public for more information about the Organization and in bringing CERN'S existence and achievements to the notice of the lay press and public. He was extremely successful in putting across to visitors the philosophy, the technology and the science of CERN, and his broad outlook and his pleasant personality had won him countless friends among the many visitors to the Organization.

NEWS and VIEWS

Wolfson Research Professorship of the Royal Society: Dr. Dorothy C. Hodgkin, F.R.S.

Dr. Dorothy Hodgkin has been appointed by the Council of the Royal Society as the first holder of the Wolfson research professorship, endowed by the Isaac Wolfson Foundation. Dr. Hodgkin gained recognition as an expert in X-ray crystallography early in her career, while still working with Bernal, contributing frequently to the crystallography section of the Chemical Society's Annual Reports from 1933. Educated at Somerville College, Oxford, she returned there as chemistry tutor; later she was appointed as University reader in X-ray crystallography and became a Fellow of the College. Academic distinctions came quickly—honorary D.Sc. of the University of Leeds, election in 1947 as one of the small handful of women Fellows of the Royal Society, and a Royal Medal of the Society in 1956. She is also a foreign member of both the Netherlands and the U.S. Academies of Sciences. Instead of choosing between career and family, Dorothy Hodgkin has made a brilliant success of both, with three children and one grandchild to her credit, besides being a charmingly informal hostess. With the help of devoted groups of research students, she has contributed much new knowledge to her chosen field of X-ray crystallography. More significantly, however, she has forged ahead in seemingly impossible directions with the investigation of ever more complex biological molecules—calciferol, cholesterol, penicillin, a virus, and finally vitamin B_{12}. With intuitive insight she can not merely extract the utmost information from a complex round of calculations, but can also make the next round uncannily informative by inspired predictions. As research professor she will remain at Oxford to continue this work.

Barnard Medal of Columbia University, New York: Prof. I. I. Rabi

Prof. I. I. Rabi, Higgins professor of physics at Columbia University, New York, has been awarded the Barnard Medal for 1960 for "meritorious service to science". The award, presented every five years by the Trustees of Columbia University, is made on the recommendation of the U.S. National Academy of Sciences. Dr. Rabi was born in Rymanow (old Austria-Hungary) in 1898. He graduated from Cornell University in 1919 with a bachelor's degree in chemistry; he received his Ph.D. in physics from Columbia in 1927. He has taught at Columbia University since 1929. In 1940 Dr. Rabi and a group of physicists organized the Radiation Laboratory at the Massachusetts Institute of Technology; the laboratory was devoted to the development of radar for military purposes. He was awarded the Nobel Prize for physics in 1944 for the general application of the resonance method to the magnetic properties of atomic nuclei. During 1952–56 he was chairman of the general advisory committee to the U.S. Atomic Energy Commission. He is a member of the President's Science Advisory Committee and was chairman in 1957.

The Barnard Medal was established by the will of the late Dr. Frederick A. P. Barnard, president of Columbia University during 1864–89. It is presented to "the person, if any, whether a citizen of the United States or any other country, who within the preceding five years has made such a discovery in physical or astronomical science, or such a novel application of science to purposes beneficial to the human race, as in the judgment of the National Academy of Sciences of the United States, is esteemed most worthy of such honor". Former Barnard medallists include Albert Einstein, Niels Bohr, Enrico Fermi, Frédéric Joliot and Mme. Irène Joliot-Curie, and M. A. Tuve.

United Kingdom Scientific Mission in Washington: Dr. H. T. Hookway

Dr. Harry T. Hookway has been appointed director of the United Kingdom Scientific Mission in Washington, D.C., and scientific attaché at the British Embassy there. He will succeed Mr. E. S. Hiscocks, who is returning to Britain in the autumn on completion of a three-year tour of duty to become director of the Tropical Products Institute. Dr. Hookway, who is thirty-eight, is the assistant director of the National Chemical Laboratory, where he has been since joining the Department of Scientific and Industrial Research in 1949. He is well known for his work on polymers, ion-exchange resins and saline-water conversion, and was the United Kingdom representative on the International Steering Committee for Co-operative Research in Electrodialysis (the purification of brackish water) during 1953–58. Educated at the Trinity School of John Whitgift, Croydon, and the University of London, Dr. Hookway held research posts in industry, working on oil additives, before becoming, in 1947, lecturer in organic chemistry in Battersea Polytechnic (now the Battersea College of Advanced Technology), where he obtained his Ph.D. in 1949.

Seismological Observatory, Wellington, N.Z.: Mr. R. C. Hayes

On May 31, Mr. R. C. Hayes, superintendent of the Seismological Observatory, Wellington, New Zealand, retired after forty years scientific work in the N.Z. Government service. He joined the staff of what was then the Hector Observatory in 1920, and worked under the late Dr. C. E. Adams until 1936, when he was appointed acting-director of what had become the Dominion Observatory. In 1948, the Observatory assumed its present name, and Mr. Hayes became director. This title was changed to superintendent when the Observatory became part of the Geophysics Division of the N.Z. Department of Scientific and Industrial Research in 1951.

Under the direction of Mr. Hayes, N.Z. earthquake recording grew from two Milne pendulums—at Wellington and Christchurch—to a network of modern instruments extending from Afiamalu in Samoa to Scott Base in the Antarctic. He has pioneered many branches of seismological work in the south-west Pacific, publishing papers on deep-focus earthquakes, crustal structure, ground tilting, and the general seismicity of the region, as well as assuming the responsibility for a growing burden of standard measurements, and training the staff to deal with them. He was the first to direct attention to the appearance of the phase *sSoS* in seismograms, and to its usefulness as an indicator of focal depth. The work of the Observatory also included the keeping of a national time service; and during the International Geophysical Year, Mr. Hayes undertook the organization of the N.Z. latitude and longitude programme. He personally made many of the observations with the Danjon astrolabe, as well as undertaking an augmented programme in seismology. Observational astronomy has been an important spare-time interest, and for many years Mr. Hayes carried out regular sunspot observations from his home at Karori. He also made a complete sweep of the southern heavens with a 4-in. refractor, and compiled a catalogue of all the nebulæ, clusters, and double and coloured stars visible through it. In addition to his scientific interests, Mr. Hayes is a keen musician and a church organist.

Crystal Physics at Cambridge:

Dr. W. A. Wooster

A FAREWELL dinner was given on June 10 by Prof. C. E. Tilley, head of the Department of Mineralogy and Petrology at Cambridge, to mark the retirement of Dr. W. A. Wooster. Invited by the late Prof. A. Hutchinson to start courses for undergraduates in theoretical and experimental crystal physics, Dr. Wooster was appointed in 1927. These courses, in conjunction with courses in X-ray crystallography, have formed a good basis for the understanding of the modern science of crystals. Dr. Wooster has published two books, "A Text-book of Crystal Physics" and "Experimental Crystal Physics", the latter of which has been translated into four foreign languages. During the War, in collaboration with his wife, Dr. Wooster established a private laboratory where it was possible to make some contribution to the national needs in connexion with diamonds and quartz crystals. The first hydrothermal synthesis of quartz in Britain was carried out in this laboratory. Dr. Wooster has also been concerned with the development of X-ray crystallographic instruments. During the past decade he has worked in the Cavendish Laboratory on diffuse reflexions of X-rays from crystals, and with his research students he has developed methods of determining the elastic constants of crystals. Dr. Wooster intends to do research work in his own laboratory and to continue his efforts for international co-operation in science through the World Federation of Scientific Workers.

Mullard Cryomagnetics Laboratory at Oxford

THE development of iron-free magnets giving large magnetic fields over a fairly large volume has been in progress at the Clarendon Laboratory, Oxford, using a 2-mW. generator installed in the Simon Building in 1949. Such magnets led to success in nuclear orientation experiments in 1951, and nuclear cooling experiments in 1956. At present the magnets give fields up to 50 kilogauss over a volume of 500 cm.^{3}, and are used at four 'stations', two of which, owing to the serious overcrowding of the Laboratory in all departments, are housed in a lean-to shack. A much-needed extension of the Simon Building has been made possible by the generous gift of £25,000 by the Mullard Co., together with grants from the Oxford University Higher Studies Fund and other University sources. Two floors of this extension will be devoted to the high magnetic field work, and will be known as the Mullard Cryomagnetics Laboratory. Seven magnet stations are planned, with fields up to about 120 kilogauss. These will be used for further development of nuclear orientation and nuclear cooling under the direction of Dr. N. Kurti, reader in physics, together with work in the field of solid state physics including semiconductors, antiferromagnetics and ferrimagnetics. It is hoped there will be sufficient facilities to accommodate occasional visitors who wish to carry out important experiments requiring high magnetic fields.

The Royal Society of Edinburgh

To help visitors to the Library and Museum of the Royal Society of Edinburgh, the Curator, Dr. Douglas Guthrie, has prepared an account of the many portraits and has added suitable biographical notes ("Year Book of the Royal Society of Edinburgh, 1959–60"). Altogether, the note contains descriptions of twenty former presidents, ten general secretaries and thirty other distinguished men of science. Among the presidents are such well-known names as Sir Walter Scott, who was the only 'literary' president ever to hold office; Sir James Hall; Sir David Brewster, whose mathematical career was dogged by his 'heretical' religious views; Lord Kelvin, president on three occasions; Sir Alfred Ewing, who built up the school of engineering at Cambridge; Thomas Stevenson, a member of the famous family of lighthouse engineers and father of Robert Louis Stevenson; the famous botanist, Prof. F. O. Bower; Sir Edward Sharpey-Schafer, whose method of resuscitation known as the 'prone-pressure system' became widely adopted; and Sir D'Arcy Wentworth Thompson, "so versatile that he could speak acceptably on almost any subject, even in an age of specialists". Other distinguished men of science include such names as James Watt, William Murdock, Sir Humphry Davy, David Hume, Georges Cuvier, J. J. Berzelius, Lord Raleigh, Sir Joseph Barnes, Sir J. J. Thomson; they reveal the debt which the world owes to the Royal Society of Edinburgh. Portraits of the first four presidents illustrate the paper.

The European Federation of Corrosion

THE British Association of Corrosion Engineers has been elected a member of the European Federation of Corrosion. The object of the Federation, which is a non-profit making union, is to promote European co-operation in the field of research on corrosion and methods of combating it for the benefit of the community at large. Membership of the Federation is restricted to non-profit-making European technical and scientific societies the activities of which are connected with the field of corrosion or the protection of materials. The Federation seeks to achieve its objects by convening joint European meetings for the discussion of subjects of general interest; by convening meetings of working parties for the discussion of specific problems; by the creation of working groups for investigating special problems; by the organization of study trips; and by other means. The General Secretariat of the Federation is managed jointly by the Dechema in Frankfurt a.M. and the Société de Chimie Industrielle in Paris.

The British Association of Corrosion Engineers was formed last year (see *Nature*, 183, 1779; 1959) generally to promote the dissemination of technical information about corrosion matters; to develop the free interchange of information among members; and to promote such educational and other facilities as may be required for the establishment of corrosion engineering as a recognized profession. Individual membership (two guineas a year) is open to everyone interested and associated with corrosion engineering. The address of the Honorary Secretary is 97 Old Brompton Road, London, S.W.7.

The British Hydromechanics Research Association

THE twelfth annual report of the British Hydromechanics Research Association covers the year October 1958–September 1959, in which the membership increased by 14 to 89 ordinary and 104 associate members. Brief summaries are given of some of the research in progress, including the construction of a new apparatus for testing mechanical and radial-face seals, an attempt to explain the sealing mechanism of fabric-rubber seals for reciprocating shafts, and a study of the effects of internal leakage of energy from centrifugal pumps through neck rings. Careful tests with a modern design of a large fan showed that velocity measurements in a rectangular discharge-duct at equidistant points in the cross-section gave results 2·7 per cent or more too high. Work is also complete on model tests for the National Coal Board to study flow-conditions and determine pressure losses in gallery-type fan drift junctions and shaft insets, and experimental work has been completed on the influence of size distribution on the flow-characteristics of liquid/solid mixtures, where the solid particles are larger than about 100 mesh. The National Physical Laboratory electronic simulator has been used to investigate surge problems associated with the design of the siphon draw-off tower for Tryweryn reservoir, and the possibilities of de-priming a siphon while passing a high discharge were also examined. Results have been obtained for the fatigue of four flexible high-pressure hoses, and work continued on a model valve for automatic control systems. As a result of tests on a model of the four tidal gates and diversion channel, and on another large model of one pair of gates for a new tidal outfall proposed by the Cheshire River Board for the River Birkett at Birkenhead, a silt deflector and other hydraulic improvements have been added to the original design and gates calibrated as a means of measuring river flow.

Medical Research in France: the Paris Hospitals

French Science News (No. 1, 1960, January–March) includes a special article on medical research in the Paris hospitals, covering both the more or less autonomous organizations such as the Pasteur Institute, the Cancer Institute, the National Blood Transfusion Centre, the Atomic Energy Commission at Saclay with the d'Orsay Hospital and laboratory and the research centres set up within the Hospitals of Public Assistance. These hospitals include about twenty research organizations which have the advantage of being in intimate contact with the patient any time it is necessary. Some of these centres have been grouped since 1955 into the Claud Bernard Association, founded in June 1953, to facilitate the development of medical and biological research in these hospitals. The article outlines the organization and orientation of research in these various centres, including the leukaemia and blood disease research centre, the research centre for the medical application of isotopes, the allergy and immunology research centre, the renal insufficiency research centre, the centre of immuno-pathology, the biological research centre for new-born infants, the neurophysiology, the pharmacological, the experimental surgery, and the cardiological research centres, the gerontological centre, the medical biochemistry research laboratory, the laboratory for medical biochemical research, the neurorespiratory revival centre of the clinic for infectious diseases, the clinic for medical and social rheumatology, the dietetic and human nutrition research unit, and the gastro-enterological research centres, Saint-Antoine and Bichat Hospitals.

Darwin's Notebooks on Transmutation of Species

IN his "First Notebook", on transmutation of species, Darwin satisfied himself that it had occurred when populations were isolated and no longer able to prevent variation that resulted from sexual reproduction, and is normally kept in check by breeding throughout the population. In this way varieties become split off from the species and eventually become species themselves, while old species become extinct, thereby increasing the separation between surviving species, many of which after being split into daughter species become genera. In his "Second Notebook", which represents his train of thought from the beginning of February until the first half of July 1838, Darwin was already concerned with the problem of expressing his views on paper and gave himself instructions for presenting his theory. Like the "First Notebook" (see *Nature*, 185, 580; 1960), the "Second Notebook" has been edited by Sir Gavin de Beer and issued with explanatory notes (Bulletin of the British Museum (Natural History). Historical Series. 2, No. 3: Darwin's Notebooks on Transmutation of Species. Part 2. (February to July 1838.) Pp. 75–118. (London: British Museum (Natural History), 1960.) 15*s*.). The "Second Notebook" not only describes Darwin's methods of presenting his theory but, incidentally, gives his views on slavery, education, and "the improvement of women".

English Rural Life

THE report of the Museum of English Rural Life for 1959 is, as usual, far more than a formal statement (pp. 22, 5 plates. Reading: Museum of English Rural Life, The University, 1960. 1*s*.). This Museum in the University of Reading is still engaged in its threefold task of collecting objects from the countryside, accumulating a library of documentary information and carrying out research on the material acquired. The Museum is, however, concerned that, owing to lack of financial support, it is not possible to send experienced field workers on collecting and recording expeditions to obtain information when so much detail is being lost almost daily. A voluntary panel of Museum correspondents gives much assistance, and again it is stressed that the Museum is not in competition with other institutions having collections of rural material, but is seeking rather to increase the total amount available for study. Miss Anne Sheppard contributes an illustrated article on traditional dairying which includes a catalogue of the Museum material on this subject. It is emphasized that the rapid increase in milk-production during this century, and the policy of supplying an ever-increasing population with milk and its products, have stimulated scientists and engineers to produce methods and machines far removed from the original crafts.

New Principle in Weaving

The first new basic principle in the weaving of woollen and worsted cloth to be introduced since the Middle Ages has recently been announced by the Wool Industries Research Association (Wool Industries Research Association. Report of the Director of Research for 1959. Pp. 39. Publication No. 214. Headingley, Leeds: Wool Industries Research Association, 1960). Since foot-power looms were first used, the warp threads have been raised and lowered according to the pattern required; the weft has been shot across and beaten into place by the 'reed' and the selvedges of the cloth have been maintained at their proper width by the 'temple'. Ever since that time—particularly since the introduction of power looms at the end of the eighteenth century—the strain on the warp threads due to beating-up of the reed has been a common cause of the threads breaking. The new invention is the full-width temple of the Wool Industries Research Association, which not only maintains the width of the cloth during weaving, but also virtually relieves the warp threads of all extra strain due to the beating of the reed. The new temple holds the cloth firmly across its whole width about a quarter of an inch behind the place where each new pick is inserted. The essential principle is that the weft is forced into its proper place by means of a reduction of the tension in the cloth rather than an increase of the tension in the warp threads.

The Library Association

Besides its reference to approaches made by the Library Association to the Minister of Education, requesting the introduction of legislation to implement recommendations of the Roberts Report, the annual report of the Association for 1959 deals with several matters of interest to the scientist and technologist (pp. 27. London: Library Association, 1960). A deputation met the Secretary and other officers of the Department of Scientific and Industrial Research in July to press the Association's proposals regarding the scope and organization of the National Lending Library for Science and Technology. It was urged that the professional staff of the Library should be chartered librarians, and further representations on the issue of staff were afterwards made to the Consultative Committee for the Library set up by the Department later in the year. A strong protest was made to the Department regarding the composition of that Committee. Criticisms and suggestions regarding the draft regulations for borrowing facilities at the Library were also made at the invitation of the Department. Representations were made to the Publishers Association regarding an increase in the number of imperfect copies, and evidence was submitted to that Association; and in protesting to the American Chemical Society following the large increase in the subscription rates of *Chemical Abstracts*, the Association urged that the concessional rates of subscription granted to teaching institutions should be available to public libraries also. The report records a total membership of 12,536, of which 1,164 are institutional and 3,601 Associates and 1,601 Fellows on the Register at December 31, 1959.

Bibliographical Citation

A second edition of the articles by C. C. Barnard, "Bibliographical Citation", first published in *The Librarian* in 1950, has now been issued to facilitate even wider circulation (Bibliographical Citation. By Cyril C. Barnard. Second edition. Pp. ii+20. Reprinted, with revision, from *The Librarian*, May, July and August 1950. London: James Clarke and Co., Ltd., 1960. 2*s.* 6*d.* net). These notes embody the results of Mr. Barnard's own long experience and of his critical study of what has been written on this subject. The purpose of lists of references, bibliographies and of reading lists is clearly distinguished, and citations of manuscripts of printed books and of periodicals are likewise discussed separately. On the subject of abbreviations for periodicals, Mr. Barnard writes cogently and logically, and for this section alone his pamphlet merits attention by every scientist who is concerned with the citation or location of such references. Elementary as the four canons enunciated by Mr. Barnard appear to be, they are not always observed even by learned and professional societies, particularly those canons relating to ambiguity and to the order of words. These canons prescribe that the abbreviation should be: (1) readily intelligible without the use of a key; (2) free from ambiguities; (3) full enough to enable a reader to find the full title in an alphabetical list of periodicals; and (4) follow the same order of words as the original title. Finally, Mr. Barnard gives some guidance to authors on the arrangement of citations in lists. This scholarly pamphlet could well be widely used in technical colleges and universities to check the widespread habit of imperfect and incorrect citation which all too many graduates appear to acquire as students and maintain uncorrected in their professional life.

A Revised Geological Time-Scale

Throughout the past year, in the columns of *Nature* and elsewhere, there has been keen discussion on the geochronology of the fossiliferous formations. Until recently the geological time-scale established by Prof. Arthur Holmes in 1947 found world-wide acceptance; but much new evidence on the ages of rocks, deriving principally from argon/potassium and rubidium/strontium datings, consistently demands an extension of this chronology, with the beginning of the Cambrian period carried back from 520 million years to about 600 million years. The full arguments favouring "A Revised Geological Time-Scale" have now been presented by Prof. Holmes (*Trans. Edinburgh Geol. Soc.*, 17, 183; 1960; preprint, price 3*s.* 6*d.*, published by Oliver and Boyd, Edinburgh). On this scale the geological periods open at the following dates: Cambrian, 600 ± 20; Ordovician, 500 ± 15; Silurian, 440 ± 10; Devonian, 400 ± 10; Carboniferous, 350 ± 10; Permian, 270 ± 5; Triassic, 225 ± 5; Jurassic, 180 ± 5; Cretaceous, 135 ± 5; Tertiary, 70 ± 2 million years. A contemporary review of much the same data, on "Aspects of Radiogeology", has been published by Prof. C. F. Davidson (*Liverpool and Manchester Geol. J.*, 2, 311; 1960); and another comparable analysis of "The Distribution of Mineral Dates in Space and Time" has been made in California by Dr. Gordon Castil (*Amer. J. Science*, 258, 1; 1960). Although in North America the various dated orogenies exhibit a crudely concentric pattern with the younger dates outwards, similar arrangements have not been found elsewhere. On the contrary, the age determinations from Africa, Australia and Eurasia are in direct conflict with the much canvassed hypothesis that the continents have accreted around nuclei of greenstones (see also p. 34 of this issue).

Brain

A RECENT issue of *Brain* (83, Pt. 1), a journal of neurology, includes two communications on the muscular disease myasthenia gravis, one by E. R. Bickerstaff and A. L. Woolf and the other by Violet MacDermot. In both studies, biopsy specimens of muscle from patients were used and the nerve endings studied, following vital staining with methylene blue. Histochemical methods for demonstrating the distribution of cholinesterase were also used by the first authors. In both communications, photomicrographs or drawings show that in the muscle of patients there is an abnormality of the distal nerve fibres with an unusual pattern of nerve branching. Elongation of the motor end-plates was a regular finding. These changes were found in muscles in which the classical staining methods showed no abnormality of the non-neural tissues. The authors were unable to establish any definite correlation between the observed changes and the disorder of neuromuscular transmission, though they make a number of cautious suggestions regarding the possible nature of the primary defect in this disease. Another communication (by R. A. Taylor) describes an unusual family in which, through five generations, certain members have shown attacks of acute neuritis, usually brachial in location. Of 119 individuals, 23 per cent of the males and 22 per cent of the females were affected by the condition, which, the author considers, is transmitted by an autosomal dominant gene with a high degree of penetrance.

Chromosome Numbers in *Amaranthus*

IN further studies of the genus *Amaranthus*, Prof. W. F. Grant (*Canad. J. Genet. Cytol.*, 1, No. 4; 1959) has reported on the chromosome numbers for 30 species. These taxa represent approximately two-thirds of the described species. With the exception of one tetraploid species (*A. dubius*, $2n = 64$), all the species are diploid, and somatic chromosome numbers of 32 (14 species) and 34 (15 species) are found in all sections of the genus. The genus is thus characterized by two basic chromosome numbers, namely, 16 and 17, which are found with equal frequency in the different taxa. In contrast to aneuploidy, euploidy has contributed very little to speciation within the genus. Chromosome number determinations for two natural hybrids of which one is considered to be the result of triple hybridization, namely, *A. cruentus* ($2n = 34$) × *A. hybridus* ($2n = 32$) = hybrid ($2n = 32$), and *A. cruentus* ($2n = 34$) × *A. powellii* ($2n = 34$) × *A. retroflexus* ($2n = 34$) = hybrid ($2n = 32$) have indicated differences in chromosome numbers between the putative parents and the hybrids. A survey of the natural interspecific hybrids reported in the literature indicates that at least half the species of the genus have been involved in hybridization. Natural interspecific hybridization and aneuploidy are considered as the major factors which have lead to species variation, speciation, and to the taxonomic complexity of the genus.

Electronic Figure Reader

THE EMI Co., Ltd., has recently held a series of public demonstrations of its 'figure reading electronic device'—*Fred*. This is a relative newcomer to the field of machines which are able to read directly from printed characters; but, because it uses a specially designed type face, it is unlikely to provide a general solution to the pressing problem of direct input to data processing machines. Nevertheless, for the more limited objective of cheque sorting for the banking industry, this new British development is likely to have a considerable future, particularly in view of the fact that an accurate arrangement of the documents is unnecessary.

Science and Faith

"QUESTIONS of Science and Faith" is one of a series, "Foundations for Faith", likely to appeal to those who have reached the final stage of their school course or are in the early terms of their university studies (pp. 63. London: The Tyndale Press, 1960. 2*s*.). A short bibliography is added for any who wish to pursue the subject further. Writing as a biochemist, Dr. Hawthorne covers most of the points raised by students genuinely interested in the validity of the Christian faith. Misunderstandings are removed concerning the so-called conflict between science and religion. The Bible, creation, the origin of life, and miracles, are some of the themes included in this short survey. It is to be commended for its clarity and is a welcome addition to the growing volume of literature which seeks to view the world of science in its relation to the realm of the spirit.

Royal Meteorological Society: L. F. Richardson Prize

THE Council of the Royal Meteorological Society has decided to institute a new award, to be known as the L. F. Richardson Prize, for the encouragement of research by young meteorologists. The Prize will consist of £25 together with a book, and will be awarded for meritorious papers contributed to the Society's *Quarterly Journal* by members who were under the age of twenty-eight at the time the papers were submitted for publication. It is intended that the award shall be made annually, subject to the attainment of certain standards. The full regulations for the new award will be printed from time to time in the Society's *Quarterly Journal* and in its monthly magazine, *Weather*.

Training Grants in Plastics Technology

APPLICATIONS are invited from young men and women now working in the plastics industry for a limited number of training grants towards the cost of full-time study on an approved course leading to a degree, diploma or other equivalent qualification in science or technology, or in industrial design. The grants are to be awarded by the trustees of the Plastics Industry Education Fund and will be made for periods of one year at a time. The value of the grants will normally be of the order of £100. Applications must be submitted in writing to the Secretary, Plastics Institute, 6 Mandeville Place, London, W.1, by July 15.

International Conference on High-Energy Physics

THE tenth annual international conference on "High-Energy Physics" is to be held at the University of Rochester during August 25–September 1. The Conference has been authorized by the Commission on High Energy Physics of the International Union of Pure and Applied Physics. Other sponsors are the U.S. National Academy of Sciences, the U.S. National Science Foundation, the U.S. Atomic Energy Commission, Office of Ordnance Research and a number of industrial organizations. Approximately 175 delegates from more than 30 countries will attend the conference including India, Australia, Sweden, Brazil, Pakistan, Israel, Mexico, Turkey, Yugoslavia, Argentina, Poland and Greece. The U.S.S.R. has signified its intention of sending a 40-man delegation. One of the most important aspects of the Conference will be the first official reports on activities of the new 25×10^9-eV. accelerator at the European Centre for Nuclear Research in Geneva. The chairman of the Conference is Prof. Robert E. Marshak, chairman of the Department of Physics and Astronomy, University of Rochester, and also secretary of the organizing committee, and from whom further information can be obtained.

Biology of Space Travel

THE Institute of Biology is arranging a symposium to consider various biological problems connected with space travel. It will be held during September 29–30, and the topics to be considered will include: the possible existence of some form of life on other planets; the danger of contamination of other planets and the Earth by space vehicles; effects of high and extremely low gravitational forces on the human body; the effects on man of radiation in space; maintenance of life in space ships; psychological problems connected with the choice of personnel for conditions of solitude and confinement. Further information can be obtained from the General Secretary, Institute of Biology, 41 Queen's Gate, London, S.W.7.

Announcements

THE following have been elected officers for the year 1960–61 of the Salters' Company: *Master*, Mr. R. S. H. Callingham; *Upper Warden*, Sir Alexander Todd; *Second Warden*, Mr. T. G. Hicks.

DR. W. R. AYKROYD, senior lecturer in the Department of Human Nutrition at the London School of Hygiene and Tropical Medicine, and recently director of the Nutrition Division of the Food and Agriculture Organization of the United Nations, has been made an honorary member of the American Institute of Nutrition.

THE United Nations Educational, Scientific and Cultural Organization Centre for Scientific Co-operation in Latin America, Montevideo, has issued as Vol. 4 of "Scientific Institutions and Scientists in Latin America" a list of scientific institutions of Argentine (pp. vi+136. Montevideo: Unesco, Centro de Co-operación Científica para America Latina, 1959).

THE seventeenth International Congress of Pure and Applied Chemistry is to be held in Munich during August 26–29. Further information can be obtained from the secretary-general of the International Union of Pure and Applied Chemistry, Dr. R. Morf, c/o Sandoz, S.A., Basle 13.

THE fifth World Forestry Congress, organized by the Government of the United States and sponsored by the Food and Agriculture Organization, will be held in Seattle, Washington, during August 29–September 16. Further information can be obtained from Dean Hardy L. Shirley, State University College of Forestry at Syracuse University, Syracuse 10, N.Y.

DURING August 29–September 9 the "Association des Cours Internationaux de Lyophilization" will be holding the second international course on "Lyophilization" at the Institute National des Sciences Appliquées in Lyons. Further information can be obtained from Dr. Louis R. Rey, Laboratoire de Physiologie, Ecole Normale Supérieure, 24 rue Lhomond, Paris 5e.

UNDER the auspices of the International Federation of Electron Microscope Societies, the Nederlandse Vereniging voor Electronenmicroscopie is organizing a European regional conference on "Electron Microscopy". This is to be held at Delft during August 28–September 3. Further information can be obtained from A. L. Houwink, secretariat of the European Regional Conference on Electron Microscopy, Julianalaan 67a, Delft.

THE first International Pharmacological Meeting is to be held in Stockholm during August 22–25, 1961. The meeting is to be held under the auspices of the Section of Pharmacology of the International Union of Physiological Sciences. Further information can be obtained from the secretary-general, A. Wretlind, First International Pharmacological Meeting, Karolinska Institutet, Stockholm 60.

THE first International Congress of Histochemistry and Cytochemistry is to be held in Paris during August 28–September 3. The Congress is organized under the auspices of the Société Française d'Histochimie in collaboration with histochemical societies in many other countries. Further information can be obtained from the secretary-general, Dr. R. Wegmann, First International Congress of Histochemistry and Cytochemistry, 45 rue des Saints-Pères, Paris 6e.

THE Czechoslovak Academy of Science is to organize an international conference on "Semiconductor Physics" at Prague during August 29–September 2, under the auspices of the International Union for Pure and Applied Physics, and which will continue the series of conferences held in Reading (1950), Amsterdam (1954), Garmisch–Partenkirchen (1956) and Rochester (1958). Further information can be obtained from Dr. Miloš Matyáš, Institute of Technical Physics, Prague 5, Cukrovarnická 10, Czechoslovakia.

ERRATUM. Mr. M. W. Hardisty, writing with reference to the communication "Sex Ratio of Ammocoetes" in *Nature* of June 18, p. 968, states that the symbols ♂ and ♀ should be reversed.

THE DECIMAL SYSTEM IN BRITAIN

DURING the past two years, committees appointed by the British Association and by the Association of British Chambers of Commerce have been examining the merits or demerits of the adoption by the United Kingdom of the decimal system of coinage and/or the metric system of weights and measures. A joint report, to which Sir Alexander Fleck contributes a foreword, has now been issued*, based on inquiries made of some 2,000 organizations, including trade associations, chambers of commerce, individual companies, learned societies and professional institutions. The report is in four parts, examining first the question of decimal coinage and then that of the metric system. In each of these parts, earlier inquiries in the United Kingdom are reviewed, and then the implications and merits of a change are considered, the cost factors and, for the metric system, the international aspects. In the third part, the improvement of the Imperial system is discussed, and in the fourth, the educational aspects such as the problems for schools and adult education.

On all the available evidence, the Committees consider that there is a strong case for the adoption of a decimal system of coinage, and, as Sir Alexander Fleck points out, this is a policy that lies wholly within our own control to determine: no international complications are involved. The Committees found little dissatisfaction expressed with the present system of coinage in industry and commerce, but wide approval of the concept of decimal coinage. There was some disagreement as to the preferred method of decimalization, but an overwhelming wish to retain the pound sterling as the major unit. If this is accepted, the pound/mil, or pound/cent, with the cent suitably subdivided, systems appear to be the most suitable, and these systems are also the most popular. Decimalization of the coinage would be helpful by simplifying money calculations, with particular advantages in the fields of business machines and education. It is primarily a domestic question; but any system which involved abandoning the pound as the major unit might lower the status of British currency. Decimalization of the coinage would give only slight advantage in international trade, and while, so far as the Committees could ascertain, the transitional costs of decimalization would be heavy, they would not be unduly large in relation to the resources of the country and the long-term benefits that would accrue. The question should be considered on its own merits independently of the system of weights and measures, but decimalization of the coinage should precede any future plan for the adoption of the metric system.

Since the evidence before the Committees was received mainly from industry and commerce, it may not accurately reflect public opinion either on the principle or the method of decimalization. General approval and understanding on the part of the public would be essential, and the report is intended in the first place to stimulate such informed discussion. The Committees believe, however, that the time has come for a decision to be made in principle on this question, and this decision can only be made by the Government. They recommend that the Government should aim at taking an early decision in principle for or against the adoption of a decimal coinage; but that before taking such a decision further inquiries should be made, including a sounding of public opinion and efforts to inform the public on the issues involved. The Committees find that a minimum of three years notice would be required to make essential preparations for the adoption of decimal coinage, and this period of notice should provide ample time to familiarize the public with the new system.

Even more emphatically, so far as weights and measures are concerned, gradualness is the keynote of the Committees' recommendations, although they do not recommend compulsory adoption of the metric system by the United Kingdom at the present time. The metric system is already legal for most purposes in the United Kingdom, and it would be possible for adoption to proceed piecemeal on a voluntary basis. For the purpose of the inquiry the view was taken that 'adoption' of the metric system by the United Kingdom meant a general adoption over a limited term of years, at the end of which the metric system would become the generally accepted system, and the Imperial system would fall into disuse.

The Committees found that little use is made to-day of the metric system in the United Kingdom except for scientific and laboratory purposes and in a few specialist fields, particularly the pharmaceutical and optical industries and scientific instruments. There is little sign here of any significant trend towards increased use, except in manufacture for, or packing for, export to metric countries, and there is no strong feeling in industry or commerce that Britain is being adversely affected either internally or in exports to metric countries by the retention of the Imperial system. Conversely, the same appears to be broadly true of manufacturers in metric countries in their efforts to sell in non-metric countries. The Committees agreed that the question of units of weights and measures is of minor importance compared with many other factors influencing the flow of international trade. There is a majority opinion that the United Kingdom should keep in line with the Commonwealth and the United States.

Although there is general agreement on the desirability of increasing standardization, there is some divergence of opinion as to how this should be achieved. At present, there still appears to be an inadequate body of agreed international standards as between the various metric countries, and certain sections of the engineering industry hold that the United Kingdom would be ill-advised to abandon such standardization as already exists in the non-metric world. Moreover, non-metric usage exists in a few industries on a world-wide basis, for example, in the oil industry, shipping, and to a high degree in aircraft manufacture and air navigation.

Generally, it is clear that transitional costs would be very heavy in some spheres, particularly engineering, but the financial benefits are difficult to assess. Should the United Kingdom decide to adopt the metric system, at least ten and sometimes 20–30 years would be required for the complete change-over, and the longer the period of change-over the lower the total transitional costs. Educational benefits are real, but are not easily measurable in terms of money. The Committees stress the existence of a general feeling that the metric system will in course of time become more widely used in the rest of the world and the United Kingdom. They recommend, therefore, a regular two-yearly review by the Board of Trade in consultation with industry and commerce, and in conjunction with corresponding bodies in the Commonwealth and the United States, and paying particular attention to trends in Japan and India and the under-developed countries of Asia and Africa. These reviews should indicate what stimulus might be given to more rapid change-over to the metric system in the United Kingdom and in what sections of industry and commerce metric usage could be introduced with most benefits and the least transitional dislocations. It is suggested that there may be a case for the British Standards Institution publishing further metric standards to facilitate manufacture in metric dimensions for export.

---

* Decimal Coinage and the Metric System: Should Britain Change? (A joint report of Committees appointed by the British Association for the Advancement of Science and the Association of British Chambers of Commerce.) Pp. xi+107. (London: Butterworths Scientific Publications, 1960.) 7s. 6d.

The Committees agree that there is real advantage to be gained now by increased rationalization of the Imperial system, and they recommend that this should be further studied. This is a specialist matter for each industry; but they suggest that all Government departments and nationalized industries could examine the practicability of eliminating intermediate units of weight between the ton and the pound avoirdupois; alternatively, use of the cental (100 lb.) should be encouraged in place of the hundredweight, and there should be a short ton of 2,000 lb. in place of the long ton of 2,240 lb. They also recommend that the apothecaries' troy and pennyweight systems be removed from school curricula, and that the rod, pole or perch of 5½ yards and the corresponding square measure of 30¼ square yards be officially abolished, and that use of the decimalized inch in place of fractions be increased. Finally, under educational aspects, they recommend that even if no action be taken on decimal coinage or the metric system, much greater emphasis should be placed forthwith on the teaching and use of decimals and the metric system in the educational curriculum of Britain from the earliest stages. This would not only promote 'decimal thinking' at an earlier age than at present, but would also be of value to entrants into industry and commerce, where the practical use of decimals is increasing.

Appendixes to the report present extracts from evidence received on decimal coinage and the metric system, and group the countries of the world according to their adoption or not of the metric system.

SELECTION OF EXECUTIVES

DURING the years immediately after the Second World War, it was the fashion for amateur and professional psychologists to see 'significance' in a great variety of phenomena, from handwriting to the choice of a wife, from remarks made during a group discussion to readiness to become angry at an interview, from imagined shapes seen in an ink-blot to the design created with a set of mosaics. That any one of these actions can be significant of itself was an assumption which has invalidated much of the psychology of personality testing during the past ten years, and such is the subject of a recent article in the *European Productivity Agency Bulletin* (No. 34; February 1960).

The recent trend has been a healthy one. Amateur psychologists are not so respected in their assessment of significant revelations. Professional psychologists have considerably limited their claims and disciplined their methods, thereby increasing their effectiveness. But much indisciplined personality testing still goes on. Recently, a works manager was appointed solely on the judgment of the managing director's wife's interpretation of the applicant's handwritten signature to a typewritten letter. A brilliant technologist was rejected in favour of a less-qualified man because he did not take a lead in a discussion with other candidates during a specially organized hotel dinner. A psychiatrist employed by a large organization in London interviews candidates for the higher staff grades and deliberately sets out to anger them, judging from the time it takes them to lose their tempers whether or not they have initiative.

Warren Lamb suggests that it is an imposition to subject a candidate to having his individual actions judged as to their significance and what they reveal without being able to defend himself. The existence of significance testing is due to two fallacies underlying the most scrupulous application of pure psychological research within industry and commerce: (*a*) that a test situation can be so devised that the candidate's response will be identical with what it would be on other occasions; (*b*) that a quality once measured (for example, dominance, perseverance) will apply in all conditions.

Validating procedures have so narrowed down the aims under (*a*) that the results of properly validated present-day performance tests are so prescribed as to make only a minor contribution to industrial selection and appraisal. The simplest of casual observation will dispose of (*b*). One would not have to search far to find the dominant business man and the submissive husband. A recent survey of top-ranking business executives in England revealed that the greatest common characteristic was extreme shyness.

Is it possible to have any form of personality testing which does not depend upon attributing significance to any one action or response? One method has been devised based on an analysis of constant elements in a person's movements.

No two people move in exactly the same way; in habitual adjustments of posture, gestures, handling of objects, a way of walking and so on, there are distinct individual differences. It has been found that everyone has certain movement co-ordinations which are constant to all his activities. That is to say, there are certain elements in the total movement which remain constant whatever the person's behaviour or emotion. For example, these elements will remain constant during an occasion when the person is sitting relaxed enjoying a casual conversation, and on another occasion when he is giving a demonstrative, angry, fiery political speech. Sets of observations taken on each occasion, and analysed separately, produce an identical result.

A person's movements are different on varying occasions. It is only part of his movement—a part even of each action—which remains constant. The full range of the constant elements will never be present in any one action. A large number of observations are needed, based on a statistical sampling method in order to have sufficient data to analyse. It has proved practicable to obtain this data in the course of a normal business interview.

The development of this work needed a more penetrating investigation into the details of a movement than has usually been the case with other investigations. The present methods have been made possible by the work of Rudolph Laban. The codification of the elements of movement upon which Laban established his notation has made it possible to record the process of variation of at least seven different movement components occurring simultaneously in the course of one action.

Movement analysis reveals those capabilities which can be expressed spontaneously. A person who can present himself or exercise authority spontaneously would not have to depend upon 'props' such as the correct dress or a conferred status. A distinction can be made between those whose authority is fixed, dependent upon a static set of circumstances, and who would have little range of the relevant movement variation, and those whose authority is spontaneous and adaptable, and who would have a good range of variation.

If a person is asked to perform a number of actions unassociated with any particular purpose and built up from within his range of constant elements, he enjoys the movement. If he is asked to perform actions built up from outside the range, he invariably feels awkward and unco-ordinated. Many experiments with people of many different vocations have shown this to be true. The range of constant elements is the range within which a person 'feels right'.

That there is a relationship between mental functioning and physical movement is implied in the development of psychosomatic medicine during the course of the present century.

The application of this work within industry has been on the basis that if a person is able to work within a set of conditions by meeting the needs from within his range of constant elements (that is to say, the range within which he 'feels right'), then he has aptitude for that set of conditions. This gives a precise definition to what is meant by 'aptitude', a word which is often used loosely as a synonym for ability, potentiality, capacity or even intelligence.

In order to make an 'aptitude assessment', it is necessary to specify the particular set of conditions, and this is done according to current techniques of job evaluation, differentiating between those aspects of the job which can be satisfied through purely technical competence and those aspects which can be met effectively only through the appropriate aptitude. It is obvious, but often little considered, that a man of a certain technical competence may be able to apply his skill effectively in one set of conditions and ineffectively in another. The aptitude assessment which derives from the analysis of constant elements in movement is a measure of a person's readiness to apply his technical skills or knowledge within a specified set of conditions.

Whereas much investigation of the 'significant response' type seeks to classify phenomena, reduces differences and generalizes, the methods of aptitude assessment based on movement observation follow a contrasting procedure. There is no classification of phenomena, differences are magnified, both within the individual and the conditions, and the resultant assessment is a particular yardstick, applying only within specified conditions. The procedure brings forward the exceptional, distinctive 'man of the moment', as against the average, conformist 'type for the job'.

The procedure is not itself exceptional and is akin to existing practices. An appreciation of the techniques is easily gained during practical study. A number of intensive two-week courses have successfully been given to executives wishing to incorporate the techniques within their own company practices.

T. H. HAWKINS

SCOPE FOR EXPANDING PULP AND BOARD INDUSTRIES IN BRITAIN

THE conclusions and recommendations of two reports prepared by Sandwell and Co., Ltd., on pulp and board mills in Great Britain (see *Nature*, March 26, p. 894) were used as the basis of a discussion organized by the Society of Foresters of Great Britain and held during November of last year. This Society is concerned with "the knowledge of technical forestry in all its aspects" and it was fitting that on this, the first, of its ventures into special discussion meetings it decided to examine the implications of the Sandwell reports. The proceedings of this meeting have now been published as a supplement to the Society's journal, *Forestry*, which is available to non-members*. The programme was designed to give a balanced picture of the problems involved in development and the individual views of industrialists, technologists, and competitors for the wooden raw material. The growers' point of view was discussed under forest management considerations and the whole idea was subjected to the economist's evaluation, and a careful summing up.

As the Society of Foresters of Great Britain included few industrialists in its membership, invitations were sent to leading personalities in the industries concerned. Dr. T. H. Frankel, of Sudbrook Pulp Mill, Ltd., a subsidiary of Wiggins Teape and Co., Ltd., said that in his view the Sandwell reports implied that the smaller the mill the less efficient it would be. In exploring the possibility of setting up a pulp mill in the Scottish Highlands, he stressed the unlikelihood of a newsprint mill being sited in Britain. He examined some of the technical and economic problems of the industry and urged that the criterion for growers of timber should be to produce the maximum bone-dry weight, bark free, per acre per annum. The development of the chipboard industry was reviewed by Mr. F. O. Lynam, of Airscrew Co. and Jigwood Ltd., who criticized the Sandwell Board Mill Survey because it did not do justice to the possibilities of development. Its most important conclusion, he believes, is that even in a large plant the economic price would have to be about £11–£12 per ton of bone-dry wood. Mr. B. J. Rendle, of the Forest Products Research Laboratory, and Dr. L. Chalk, of the Department of Forestry, University of Oxford, explained the anatomical criteria for industrial use and the problem of 'juvenile' wood, respectively. If it were known what the pulp mills would like to have, this could be taken into account in plans for improving trees by selection and breeding and by forest management. The problem of 'juvenile wood' is often over-simplified, especially by the assumption that it is a matter of age.

---

* The Development of Pulp and Particle Board Industries and Their Effect on Forest Management. Pp. 68. (Oxford University Press, 1960.) 5s.

The requirements for the coal mining industry were reviewed by Mr. B. C. Hollingsworth, of the National Coal Board, who explained that the Board has followed a policy of purchasing home-grown timber, of which it has greatly increased its consumption since 1947 and still has room for increased softwood demand. Rising production from thinnings may well meet the needs of the pulp and of the coal industries, and the arrival of a new market for the raw material would solve problems and confer benefits on all consumers as well as on producers. The prospects of greater demand from the furniture industry were explored by Mr. J. P. Pritchard, of the Furniture Development Council. In his opinion there are several ways in which growers and chipboard manufacturers could help to raise the demand for their products. The industry was progressive and expanding, like the size of the firm, thus making possible greater expenditure on design and development. As a consultant in wood technology, Dr. S. E. Wilson, who is well placed to examine the needs for housing and packing, declared that the principal aim of domestic forests in Britain has been, and still was, to supplant the imported deals, battens and boards used mainly in the building and packaging trades.

The Forestry Commission's director of forestry for England, Mr. G. B. Ryle, questioned the view that in Britain we should be justified in running our forests primarily for the pulp and board industries. Forest management, he said, implied three things in this context: the right trees for the industry; the optimum rate of growth and right specifications and operational efficiency.

The evaluation of the economists was provided by Mr. G. W. Troup, of Albert E. Reed and Co., Ltd. He said that he could not give the final answers on the prospects for small-scale pulping in Britain—about which the Sandwell reports had been rather discouraging—but he did suggest some of the questions which remained for investigation, for example, on such matters as roundwood yields and price and costs trends. One of the interesting points emphasized in the economics discussion was that the 'Outer Seven' proposals have no bearing on pulp mills, although they will affect board mills because the existing tariff protection will be gradually reduced over, at the most, ten years. This will almost certainly lead to greater integration in the pulp and paper and board industries, for example, in the Scandinavian countries, and thus add to the competitive power of imported supplies.

Many searching questions and observations were a feature of the seven discussions which followed the main papers, and many leading authorities among the members and guests of the Society of Foresters were asked to open the discussions in a formal and thorough fashion. It was held by Mr. K. N. Rankin, of the Economic Forestry Group, when he summed up what had emerged from the meeting, that there is a clear need for all to see themselves as one industry—growers, saw-millers, and processors. There is need for over-all planning as one industry and for the utmost efficiency in all sectors in order to be competitive by world standards. The objects of the planning should be 100 per cent utilization of forest products and the highest return on the capital employed in the industry. With these objectives in mind, Mr. Rankin went on to suggest what kind of pattern production should follow. Pulp and paper demand is rising at 7 per cent per annum and if supplies cannot keep pace there is a fair prospect of rising prices. The directions in which growers could more satisfactorily produce what is wanted was also reviewed in some detail. Mr. Rankin ended with the challenging questions: Why should we not export more timber products and why should we not have vertical as well as horizontal integration in the industry?

J. J. MacGregor

ATOMIC ENERGY RESEARCH IN DENMARK

The third annual report of the Danish Atomic Energy Commission describes the activities of the organization during the period April 1, 1958–March 31, 1959 (pp. 85. Copenhagen: Danish Atomic Energy Commission, 1959). It deals with the erection of the Risø Research Establishment; the reactors *DR*1, *DR*2 and *DR*3; the work of the six departments of the Establishment; international co-operation in the peaceful uses of atomic energy through the International Atomic Energy Agency, the Organization for European Economic Co-operation and the European Atomic Energy Society; and includes the texts of the addresses delivered by Mr. Viggo Kampmann, Minister for Finance, and by Prof. Neils Bohr, the president of the Commission, at the inauguration of the Establishment on June 6, 1958.

During the period under review the Commission met seven times and its executive committee thirty-three times. Prof. Neils Bohr continued as chairman of the Commission, with Dr. H. P. Christensen as vice-chairman, and H. H. Koch as chairman of the executive committee. The total staff on March 31, 1959, numbered 385, of which 214 were employed in the technical and scientific division and distributed over the six departments. The secretariat, headed by the chief of Commission secretariat, had a staff of twenty-six, including three law and one economics graduates. The office of the Commission was at the Christiansborg Palace, but the secretariat had a subsidiary office at Risø.

The physics department of the Establishment consists of the physics laboratory, the meteorology station and the reactor *DR*1. During the year a cooling system for the reactor was installed, and the power brought up to 1,100 W. Various technical measurements were carried out on the reactor, and training procedures and instructions for courses were revised and improved. The solid-state group continued work on instruments for the study of radiation damage to metals and graphite, and other groups were occupied with planning a new laboratory and its equipment in connexion with the linear accelerator ordered from the United States and with the assessment of the energy and particle balance in a very hot hydrogen plasma.

In the electronics department an analogue computer, the equipment for a 'gas-flow' proportional counter for use at the waste-water treatment plant at Risø, and a fluorimeter for the measurement of uranium content in samples with concentrations of about 10^{-9}, in addition to a number of special pieces of apparatus, have been constructed. The work of the reactor engineering department was largely concentrated on the study project for the heavy-water-moderated power reactor with an organic cooling medium to be known as *DOR*. The department has been concerned also with constructional and safety problems related to reactor-powered ships.

In addition to its direct educational and training activities in technical and scientific subjects, the report states that the Commission tries to satisfy general public interest in nuclear energy and in the Research Establishment by publications, radio and television broadcasts and exhibitions. A documentary film about Risø is being prepared. Visits to the Establishment are limited to Saturdays, and during January 1–March 31, 1959, about 1,200 persons visited Risø.

The report concludes with a list of the publications by members of the staff of the Commission, and with a detailed map of the layout at the Research Establishment.

AGE OF THE BASE OF THE CAMBRIAN

IN a recent publication[1], Prof. Arthur Holmes has proposed a revision of his 1947 time-scale. This revision was necessitated by the wealth of new age measurements made since 1947, and it is a tribute to Prof. Holmes's insight that his first time-scale, proposed in 1911 when the science of geochronology was in its infancy, has required only relatively minor revisions since that time. In view of Prof. Holmes's past successes in drawing correct conclusions from fragmentary data, it might seem unwise to question his present conclusions regarding the age of the base of the Cambrian system. Furthermore, it is true that imaginative speculation frequently proves more fruitful than sterile scepticism. Nevertheless, in this case, I feel that a critical discussion of the grounds for fixing the age of the base of the Cambrian is in order in the hope that workers may recognize that a problem exists. Otherwise the figure 600 ± 20 million years may prematurely find its way into texts and into the minds of Earth scientists as an established fact of geology.

At the outset, it must be realized that the concept of the base of Cambrian is different from that of the base of the other periods. The base of the Devonian, for example, is defined by the disappearance of characteristic Devonian fossils as one moves down the column and by the appearance of Silurian fossils. In contrast to this, the base of the Cambrian is either defined locally as an unconformity beneath strata containing Cambrian fossils or by the failure to discover lower Cambrian fossils in lower strata. In the first case, there is no reason at all for the local unconformity to have world-wide time significance, and in the latter case, the evidence is of necessity purely negative; the apparent absence of a Cambrian fauna may be due to causes other than age. For purposes of discussion, it is more useful to fix some definable horizon within the Cambrian, for example, the base of the Middle Cambrian and at least for some purposes mentally lump the Lower Cambrian with the Precambrian. This point of view does not significantly alter the discussion of the evidence cited by Holmes; it merely sharpens the definitions employed. This approach relegates to future research such difficult questions as the time of the first appearance of *Olenellus* and its simultaneity in various regions of the Earth. It will be shown that the data used by Holmes do not yield a firm upper limit to the age of the base of even the Middle Cambrian, and it therefore follows that they do not permit an upper limit to the age of any part of the Lower Cambrian, however it may be defined. (In order to avoid any ambiguity it should be pointed out the expression 'an upper limit to the age' is used to mean that the age is less than a certain number of years. In this expression the word 'upper' is therefore used in a numerical, not a stratigraphical, sense.)

The principal data used by Holmes in placing an upper limit to the age of the base of the Cambrian are those of Kulp (reported by Campana[2]) and Greenhalgh and Jeffery[3] for absite from pegmatites overlain by the Precambrian Adelaide System in South Australia. Since the Adelaide System lies below recognized Lower Cambrian strata, it is clearly pre-Middle Cambrian.

These authors report ages in million years as follows:

	^{206}Pb/^{238}U	^{207}Pb/^{235}U	^{207}Pb/^{206}Pb	^{208}Pb/^{232}Th
J. L. Kulp	520	600	915	585
Greenhalgh and Jeffery	610	674	895	675

Following Greenhalgh and Jeffery, Holmes interprets these data as a "typical loss of radon pattern", and in accordance with this a probable age of 674 million years is assigned to the sample analysed by Greenhalgh and Jeffery, with 915 million years considered an improbably high upper limit. However, it should be pointed out that there is no age pattern for a single mineral which is diagnostic of loss of radon. There are two independent uranium–lead ages, that calculated from the ratio lead-206/uranium-238 and that calculated from the ratio lead-207/uranium-235. In the data under consideration, the former age is younger than the latter, and this pattern can arise equally well from any of several mechanisms, namely, preferential loss of lead relative to uranium, additions of uranium, gain of radiogenic lead of some isotopic compositions, or preferential loss of an intermediate daughter product of the uranium-238 series, for example, radon. By simply examining the pattern of discordant ages one can never distinguish between these possibilities. The relative importance of the different possible causes of discordance must be evaluated by independent methods. I am not aware of any experimental data for absite, but measurement of the radon-loss from minerals possessing reasonably well-defined crystal structures has shown such loss to be of minor importance[4,5]. In contrast to this, there is abundant evidence from intercomparison of uranium–lead ages with ages measured by other methods that loss of radiogenic lead or, equivalently, gain of uranium, is a common cause of discordance in uranium–lead ages. If this more common process is responsible for the discordant data on the sample in question, the limit of 915 million years is a lower limit to the age rather than an improbably high upper limit. The lead-208/thorium-232 age contributes little to the argument since for unknown reasons these ages are almost always badly discordant.

Greenhalgh and Jeffery also report a potassium–argon age of 520 million years on a sample of biotite from the same rock. Even if one postulates loss of radon as the cause of discordance, this result cannot be reconciled in any simple way with the absite data. Taken altogether, the absite and biotite data indicate that for some reason the minerals in question have been open with respect to either the parent or daughter elements, or both, since the time of their original crystallization and their apparent ages are scarcely suitable for fixing a critical point in the geological column.

Some further data bearing on this matter are the results of measurements of Tilton *et al.*[6] on igneous rocks in the Wichita Mountains of Oklahoma. As pointed out by Holmes, the result of 500–550 million years places at best a limit on the age of a portion of the Upper Cambrian, since there are no Middle or Lower Cambrian strata in the region. It should be further noted that the granitic samples which have been dated are not seen in actual contact with the Cambrian strata and the inference that they are pre-Upper Cambrian is based on the assumption that they are the same age as the neighbouring Carlton rhyolite which is actually overlain by Reagan sandstone of Upper Cambrian age, or on the correlation of these rocks with pre-Reagan granites found in sub-surface drillings.

The remaining evidence cited by Holmes is that based on analysis of uraninite from Katanga, Belgian Congo. The results of age measurements of these samples are reasonably concordant and indicate an age of about 625 million years for the uranium mineralization. As quoted by Holmes, L. Cahen states that the uranium mineralization is later than the Kundelungu formation, which is assigned to the Precambrian by the absence of Cambrian fauna and by the presence of 'Late Precambrian' fossils. Cahen further concludes, as is necessary for the argument, that we can dismiss the idea that the Kundelungu sediments are much older than the uraninites. While this is the best evidence given by Holmes for saying that the age of the base of the Middle Cambrian is less than 600 million years old, the evidence is obviously not clear-cut, in view of the dubious status of Precambrian palæontology and the uncertainty in the inference that the uranium mineralization does not greatly post-date the Kundelungu sedimentary rocks. It would be of considerable interest if Dr. Cahen would discuss critically the reasons for his opinions quoted above and by Holmes.

These remarks have been made with the hope of acquainting workers both in the field of geochronology and stratigraphy with this unsolved problem. A start might be made by demonstrating unequivocally that the base of the Middle Cambrian is less than 1,000 million years old. Rocks of this age are found in many parts of the world, but I do not know of any localities where the relationship of dated rocks of this age to the Cambrian is clearly established. If the possibility that rocks of Grenville age (1,000 million years) and their age equivalents in other regions are Upper or Middle Cambrian can be definitely excluded in this way, then one may go to the rarer areas of rocks in the 600–900 million years age-range in order to see if more strict limits can be obtained.

G. W. WETHERILL

Department of Terrestrial Magnetism,
Carnegie Institution of Washington,
Washington 15, D.C.

[6] Tilton, G. R., Davis, G. L., Wetherill, G. W., and Aldrich, L. T., *Trans. Amer. Geophys. Union*, 38, 360 (1957).

WHILE in principle I am in general agreement with Dr. Wetherill, I feel that he over-rates some of the difficulties to which he refers and exaggerates their geochronological consequences.

The "base of the Cambrian" is not a natural phenomenon that can be discovered and objectively investigated. It is a mental concept, entirely dependent on definition and, until agreement is reached, subject to argument and dispute. Geologists are still actively discussing whether the criteria for defining it should be: (*a*) palæontological, for example, the first appearance of the earliest trilobites or of other fossils elsewhere associated with them; (*b*) stratigraphical, for example, the first deposits of the corresponding marine transgression; (*c*) palæoclimatological, for example, tillites and other evidence of the glaciations commonly regarded as having occurred towards the close of the pre-Cambrian; or (*d*) geochronological, a hope for the future which may eventually command widespread assent[1]. Meanwhile, most geologists consider (*b*) and (*c*) to be inappropriate because the events concerned are likely to have varied from place to place much more widely in time than the appearance of the earliest Cambrian fauna. Adopting the "lowest formation in which the biozone of *Olenellus* or its equivalent is represented" as the base of the Cambrian, I found 600 ± 20 million years to be "a reasonable estimate" for the beginning of the Cambrian Period in the light of the evidence then available[2]. Surely this is neither "imaginative speculation" nor "fixing the age". I see no reason why any geologist, however naïve, should suppose the figure provisionally adopted to be "an established fact". However, referring to "Earth scientists", Dr. Wetherill thinks otherwise, and in so far as there are now many Earth scientists who are not geologists he may be right. If so, his warning to them will serve a very useful purpose.

With regard to the age pattern for the South Australian absite (Greenhalgh and Jeffery's data) it is true, as Dr. Wetherill points out, that it could arise from a variety of different mechanisms, among which he seems to favour loss of lead and/or gain of uranium. In this case, 895 million years would approximate to the real age, leaving the lead-208/thorium-232 age to be regarded as wrong. In contrast, I was impressed by the equality of the lead-208/thorium-232 and lead-207/uranium-235 ages (675 and 674 million years, respectively), particularly because this coincidence means that all four 'ages' can be brought into concordance by the single assumption of loss of radon. Greenhalgh and Jeffery[3] say: "One might expect some radon loss in a mineral such as this abaite which has been situated in a porous shear zone since its formation in Upper Proterozoic times". If this be the correct interpretation, loss of argon from biotite would be expected to be even greater. The argon-40/potassium-40 age of 520 million years found by Greenhalgh and Jeffery for biotite from the same rock is readily accounted for by loss of argon and is therefore not so irreconcilable with the abaite data as Dr. Wetherill supposes.

However, this disagreement over the interpretation of inconclusive data is of minor significance in the light of the age determinations of Lower Cambrian and Late Precambrian glauconites summarized on p. 195 of my paper[2]. Working at the Massachusetts Institute of Technology, Cormier obtained a rubidium/strontium age of 584 ± 30 million years for glauconite from a sandstone in the Murray Shale formation of Blount Co., Tennessee. It is notable that the first diagnostic Lower Cambrian fossils appear in shales 500 ft. higher up in the section. This result agrees closely with the argon-40/potassium-40 ages of Lower Cambrian glauconites which have been dated by Russian workers.[1] One particularly valuable set of results refers to drill-cores from the Serdobskaya Borehole R-2, which passes through flat-lying Lower Cambrian strata and penetrates well into the Late Precambrian formations of the Upper Sinian, which are also flat-lying. Here, in the central part of the Russian Platform, which has long remained undisturbed by igneous or tectonic activities other than gentle vertical movements, only a slight disconformity separates the Cambrian from the Sinian. There could scarcely be a better environment for the retention of radiogenic argon. The age determinations, summarized in Table 1, have been recently revised by Polevaya, Kazakov and Murina[4], using $\lambda_e = 0 \cdot 557 \times 10^{-10}$ yr.$^{-1}$ and $\lambda_\beta = 4 \cdot 72 \times 10^{-10}$ yr.$^{-1}$ for the age calculations. In the last column the ages are re-calculated with $\lambda_e = 0 \cdot 585 \times 10^{-10}$ yr.$^{-1}$ to correspond with current American and British practice.

Table 1

	Depth from surface	$\frac{^{40}Ar}{^{40}K}$	Ages in m.y. (± c. 10%) P., K. and M.[4]	Ages in m.y. (± c. 10%) Re-calculated
Lower Cambrian	1,380 m.	0·0398	606	566
Disconformity	1,630			
Upper Sinian	1,758	0 0499	734	692
	1,787	0·0499 0 0515	732 753 } 743	692 710 } 701

Dating of these specimens by the rubidium/strontium method is in progress and it may reasonably be hoped that Dr. Wetherill's doubts will be resolved during the next two or three years. Perhaps even better evidence may be forthcoming from the dating of Lower Cambrian and Late Precambrian lavas. Here a start has already been made, stimulated by the International Geochronological Conference organized by the New York Academy of Sciences in March, and likely to be still further advanced as a result of the discussions of the Cambrian/Precambrian problem which are scheduled for the forthcoming meetings at Copenhagen of the International Geological Congress.

ARTHUR HOLMES

NUCLEAR FISSION IN THE EARLY HISTORY OF THE EARTH

By PROF. P. K. KURODA

Department of Chemistry, University of Arkansas, Fayetteville, Arkansas

IT has long been speculated that at least part of the heavier isotopes of xenon in the Earth's atmosphere are fissiogenic[1–3]; but it was not possible to treat this problem on a quantitative basis until Reynolds[4] showed that the abundance ratio of the stable xenon isotopes in the Richardton meteorite was different from that in the Earth's atmosphere[5].

The difference indicates that at least 10 per cent of the atmospheric xenon-136 is fissiogenic. This is much greater than that expected from the uranium-238 spontaneous fission alone, but can be explained as due to the spontaneous fission of some of the extinct trans-uranium elements and/or the induced fission of uranium-235 in the early history of the Earth. The contribution from the natural fission processes is estimated to be at least 10^4 times that from the recent artificial nuclear explosions.

Differences in the isotopic rations of xenon in the Earth's atmosphere and in the meteorite may be written as:

$$\delta_i = \left(\frac{Xe^i}{Xe^{130}}\right)_T - \left(\frac{Xe^i}{Xe^{130}}\right)_M \qquad (1)$$

where Xe^{130} is used as a reference standard for the following reasons: (*a*) the abundance of this nuclide is fairly large, and hence the errors in the mass-spectrometric measurements are expected to be small; (*b*) it is shielded by tellurium-130 (the half-life for the double β-decay of tellurium-130 was estimated by Inghram and Reynolds[4] to be $1 \cdot 4 \times 10^{21}$ years), and the amount produced by fission can be regarded as negligible; (*c*) possibility of the production of this nuclide by other nuclear reactions appears to be comparatively small[6].

Table 1. COMPARISON OF THE ISOTOPIC COMPOSITIONS OF XENON IN THE ATMOSPHERE AND IN THE RICHARDTON METEORITE

Mass No. (i)	Atmosphere $(Xe/Xe^{130})_T$	Meteorite $(Xe^i/Xe^{130})_M$	δ_i	Δ_i
124	0·024 ± 0·000	0·035 ± 0·004	−0·011 (±0·004)	−0·0005
126	0·022 ± 0·000	0·029 ± 0·004	−0·007 (±0·002)	−0·0003
128	0·470 ± 0·003	0·528 ± 0·082	−0·058 (±0·085)	−0·0002
129	6·47 ± 0·06	9·18 ± 0·29	−2·71 (±0·35)	−0·02
130	1·000 ± 0·000	1·000 ± 0·000	0·000	0·000
131	5·18 ± 0·05	5·05 ± 0·17	+0·13 (±0·22)	+0·01
132	6·58 ± 0·05	6·15 ± 0·16	+0·43 (±0·21)	+0·03
134	2·56 ± 0·01	2·40 ± 0·06	+0·16 (±0·07)	+0·02
136	2·17 ± 0·01	1·98 ± 0·03	+0·19 (±0·04)	+0·03

The values of δ_i calculated from the data by Reynolds[4] and Nier[5] are shown in Table 1.

The large negative value of δ_i for xenon-129 is due to the decay:

$$I^{129} \xrightarrow{1{\cdot}7 \times 10^{7}\ \text{yr.}} Xe^{129}$$

as pointed out by Reynolds[4]. The small negative values of δ_i for the lighter isotopes are probably due to mass fractionation or cosmic-ray-induced nuclear reactions.

Suess[7] derived the following equation which correlates the ratio of the terrestrial abundance ($N_{\text{ter.}}$) and the cosmic abundance ($N_{\text{sol.}}$) of the rare gases with the mass (M/m_1):

$$-\log \frac{N_{\text{ter.}}}{N_{\text{sol.}}} = 10 \cdot e^{-0{\cdot}045 M/m_1} + 7{\cdot}1 \qquad (2)$$

Differences (Δ_i) in the isotopic ratios of xenon in the Earth's atmosphere and the cosmic abundance ratios $(Xe^i/Xe^{130})_C$:

$$\Delta_i = \left(\frac{Xe^i}{Xe^{130}}\right)_T - \left(\frac{Xe^i}{Xe^{130}}\right)_C \qquad (3)$$

can be calculated from equation (2).

The values of Δ_i thus calculated are shown in column 5 of Table 1.

It is interesting to note in Table 1 that the values of δ_i and Δ_i vary in the same direction; but the absolute value of δ_i is always much greater than that of Δ_i, suggesting that the effect of the mass fractionation is probably small.

A maximum contribution from the uranium-238 spontaneous fission can be calculated from the terrestrial abundance ratio of uranium to xenon. The number of atoms of Xe^i produced by the uranium-238 spontaneous fission is:

$$(Xe^i)_f = \frac{\lambda_f}{\lambda_\alpha + \lambda_f} (U^{238}) [\exp\{(\lambda_\alpha + \lambda_f)T\} - 1] \,.\, Y_i \qquad (4)$$

where λ_α and λ_f are the decay constants for the alpha decay and the spontaneous fission of uranium-238, respectively, (U^{238}) is the number of atoms of uranium-238 in the system, Y_i is the fission yield for Xe^i, and T is the age of the system.

From equations (1) and (4):

$$\delta_i = \left[\left\{\frac{(U^{238})}{(Xe^{130})}\right\}_T - \left\{\frac{(U^{238})}{(Xe^{130})}\right\}_M\right] \cdot \frac{\lambda_f}{\lambda_\alpha + \lambda_f} \cdot [\exp\{(\lambda_\alpha + \lambda_f)\, T\} - 1] \,.\, Y_i \qquad (5)$$

Damon and Kulp[8] found that the present rate of escape of helium-4 and argon-40 from the Earth's crust is far too small to account for the quantity of argon-40 in the atmosphere, and concluded that most of the argon-40 was introduced into the atmosphere in the first billion years of Earth history from the mantle and crust. The positive values of δ_i for the heavier isotopes of xenon indicate that the uranium/xenon ratio in the meteorite system is smaller than that in the terrestrial system and hence:

$$\delta_i < \left\{\frac{(U^{238})}{(Xe^{130})}\right\}_T \cdot \frac{\lambda_f}{\lambda_\alpha + \lambda_f} [\exp\{(\lambda_\alpha + \lambda_f)(4{\cdot}5 \times 10^{9})\} - \exp\{(\lambda_\alpha + \lambda_f)(3{\cdot}5 \times 10^{9})\}] \,.\, Y_i \qquad (6)$$

From the total amount of uranium in the crust and in the mantle (1·3 p.p.m. uranium in the crust and 0·01 p.p.m. uranium in the mantle; mass of crust = 23·7 × 10^{24} gm.; mass of mantle = 4,060 × 10^{24} gm.) and the number of atoms of xenon in the atmosphere = 8·14 × 10^{36}, given by Damon and Kulp, we have from equation (6), $\delta_i < 0{\cdot}004$ for xenon-136. (Damon and Kulp gave a range of 0·01–0·1 p.p.m. for uranium in the mantle; but in view of the recent data obtained by Hamaguchi, Reed and Turkevich[9], which indicate that older analyses for uranium were generally too high, the lower value 0·01 p.p.m. uranium was accepted.)

The observed value of $\delta_i = 0{\cdot}19 \pm 0{\cdot}04$ for xenon-136 is much greater than the calculated maximum contribution from the uranium-238 spontaneous fission, thus indicating that the uranium-238 spontaneous fission alone could not have caused such

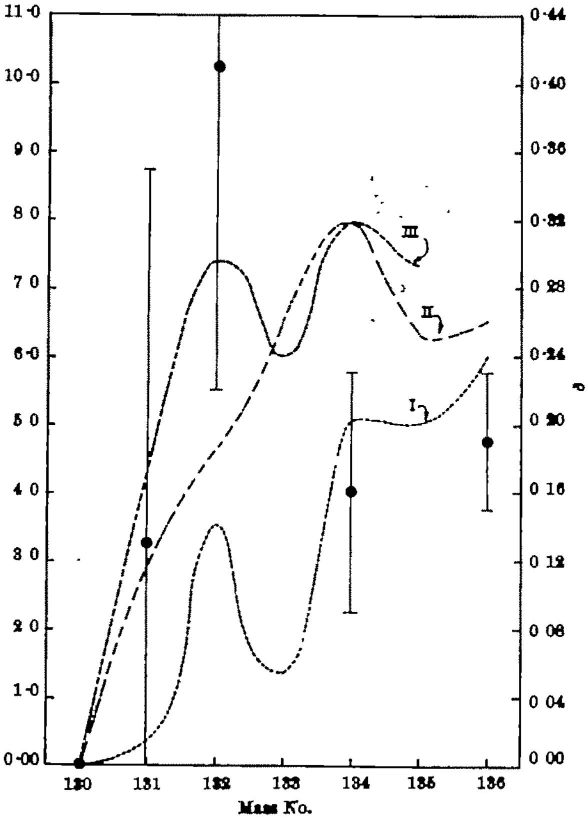

Fig. 1. Comparison of the value of δ_i with the mass-yield curves for various types of fission. I, uranium-238 spontaneous fission; II, uranium-235 neutron-induced fission; III, curium-242 spontaneous fission

The mass-yield curve for uranium-235 neutron-induced fission was taken from the report by Katcoff (ref. 18), that for curium-242 spontaneous fission was taken from the data by Steinberg and Glendenin (ref. 19), and that for uranium-238 spontaneous fission was constructed from the xenon data by Wetherill (ref. 13) and from the iodine data by Kuroda, Edwards and Ashizawa (ref. 10) and Ashizawa and Kuroda (ref. 11) a large difference in the xenon-136/xenon-130 ratio between that in the atmosphere and in the meteorite.

The values of δ_f are plotted in Fig. 1, together with the mass-yield curves for the spontaneous fission of uranium-238 and curium-242, and also for the neutron-induced fission of uranium-235.

The mass-yield curve thus obtained from the values of δ_f differs from that for the uranium-238 spontaneous fission in that the fission yield at mass 132 seems to be abnormally high. The presence of a peak at mass number 132 in the mass-yield curve for uranium-238 spontaneous fission was found by Kuroda *et al.*[10],[11]. It is interesting to note a similar peak in the curium-242 spontaneous fission mass-yield curve. This leads to a speculation that the abnormally high yield at the mass 132 might be due to the spontaneous fission of some of the extinct trans-uranium elements.

The only known trans-uranium element, which might have been present in an appreciable quantity in the early history of the Earth is plutonium-244. The half-life of plutonium-244 (8×10^7 years) is not too short as compared with the time-interval between the formation of the element and that of the Earth.

If it is assumed that plutonium-244 and uranium-238 were formed in equal abundance at the time of formation of the element, then the plutonium-244/uranium-238 ratio at the time of the formation of the Earth would have been approximately 0·05.

The ratio of the α-decay half-life and the spontaneous fission half-life of plutonium-244 is $8 \times 10^7/2{\cdot}5 \times 10^{10} = 3{\cdot}2 \times 10^{-3}$, while that of uranium-238 is $4{\cdot}5 \times 10^9/8{\cdot}0 \times 10^{15} = 5{\cdot}6 \times 10^{-7}$. Thus, the ratio of the contributions from plutonium-244 and uranium-238 is calculated to be:

$$\frac{0{\cdot}05 \times 2 \times 3{\cdot}2 \times 10^{-3}}{5{\cdot}6 \times 10^{-7}} = 570$$

or the contribution from the plutonium-244 spontaneous fission would have been several hundred times greater than that from the uranium-238 spontaneous fission.

Another important source of contribution to the atmospheric inventory of xenon is the neutron-induced fission of uranium-235. It has been pointed out by Kuroda[12] that an assemblage of uranium and water could have easily become a self-supporting chain-reacting system in the early history of the Earth. The ratio of induced fission versus spontaneous fission in some of the pitchblende ores is known to be as high as 30–50 per cent[13-15]. Kenna and Kuroda[16] have recently estimated from the radiochlorine data that the ratio in Belgian Congo pitchblende is 50 ± 5 per cent. Considering the fact that the age of the pitchblende is only about 500 million years, it is quite reasonable that the ratio in such uranium ore deposits could have been much greater than unity in the early history of the Earth.

In connexion with the contribution of uranium-235 induced fission, it is of some interest to compute the contribution from the recent nuclear bomb tests. According to Libby[17], the estimated total stratospheric injection of strontium-90 since 1952 is 66 megaton-equivalents, which correspond to an addition of about 0·5 ton of xenon-136. The total inventory of fissiogenic xenon-136 in the atmosphere is calculated to be of the order of 10^6 ton, or at least one million times greater than the contribution from nuclear bomb tests.

This work was supported by the U.S. Atomic Energy Commission. I am grateful to Prof. Edward Anders of the University of Chicago for his valuable suggestions and encouragement.

GLUCOSAMINE VALUES OF MURAMIC ACID AND OTHER AMINO-SUGARS BY THE ELSON AND MORGAN METHOD

By R. E. STRANGE

Microbiological Research Establishment, Porton, Wiltshire

WHEN muramic acid is determined by the Elson and Morgan method as described by Rondle and Morgan[1], its glucosamine value on an equal weight basis (light absorption at 530 mμ of the coloured derivative divided by that of the derivative formed from an equal weight of glucosamine multiplied by 100) is about 30 per cent[2]. If 0·5 *N* sodium carbonate used in this method is replaced by a buffer containing equal volumes of *M* sodium carbonate and *M* sodium bicarbonate *p*H 9·6[3], other conditions being the same, a glucosamine value of about 50 per cent is obtained[4]. Crumpton[5] has pointed out that glucosamine values for mannosamine and galactosamine reported by different laboratories vary significantly, presumably due to variations in the method of estimation. In my experience such values are reproducible within the limits of error of the method, and the use of a predetermined value is not likely to introduce serious errors when conditions of analysis are kept constant. However, pure samples of certain amino-sugars are not always available and this leads to the use of independently reported figures. Errors will arise if

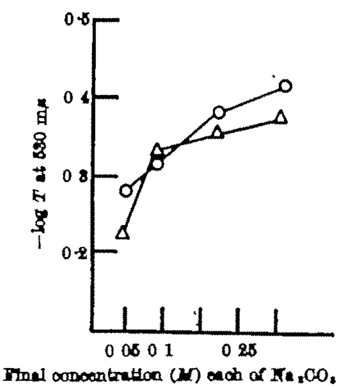

Fig. 1. Absorption values at 530 mμ of the coloured derivatives obtained in the Elson and Morgan reaction from 100 μgm. muramic acid (○) and 60 μgm. glucosamine hydrochloride (△) when the concentration of buffer salts present during reaction with acetylacetone is increased

the concentration of an amino-sugar as glucosamine determined using one set of conditions is converted to concentration of specific amino-sugar by means of a factor determined using different conditions.

Solutions containing weighed quantities of crystalline muramic acid, galactosamine hydrochloride and glucosamine-6-phosphate were determined by three modifications of the original Elson and Morgan method. The methods were : (1) according to Rondle and Morgan[1]; (2) as for (1), but a buffer containing equal volumes of *M* sodium carbonate and *M* sodium bicarbonate, *p*H 9·6[2] was used in place of 0·5 *N* sodium carbonate; (3) as described by Boas[3] (2 ml. of sample heated with 1 ml. *N* sodium carbonate containing 2 per cent (v/v) acetylacetone for 45 min. at 90° C.). Each amino-sugar was tested in triplicate by these methods, the average of the spectrophotometric readings at 530 mμ being compared with that given by an equimolar solution of glucosamine hydrochloride. With the exception of muramic acid[4], the coloured derivatives absorbed most strongly when light with a wave-length near 530 mμ was used. In all cases the glucosamine value varied with the method used, results for muramic acid being 48, 75 and 34 per cent with (1), (2) and (3) respectively (Table 1). The difference in results obtained with methods (1) and (2) was not due to difference in the *p*H value of the reaction mixtures containing acetylacetone for this was nearly the same (*p*H 9·5–9·6). Nor was there a significant change in *p*H in either case during heating for 20 min. at 100° C. Therefore, the only difference was the composition and concentration of the alkaline salts present. When the final concentration each of sodium carbonate and sodium bicarbonate was varied from 0·042 to 0·25 *M*, acetylacetone concentration being kept constant, the amount of coloured derivative formed with Ehrlich's reagent increased with increasing buffer concentration, particularly in the case of muramic acid (Fig. 1). The *p*H values of the reaction mixtures decreased as the buffer salts were reduced, but this was probably significant only in the case of the lowest concentration.

The lowest result for muramic acid, obtained using the Boas method, could not be due to the alkaline salt concentration, for this was twice that used in method (1). Here the *p*H value of the solution during reaction with the same concentration of acetylacetone as used in (1) and (2) was near 10, and it was shown that *p*H is an important factor by the following experiment : buffers of *p*H 8·8, 9·1, 9·6 and 9·8 were prepared by mixing appropriate volumes of *M* sodium carbonate and *M* sodium bicarbonate. Acetylacetone (2 per cent v/v) was added to each buffer (which reduced the *p*H values in all cases) and the resulting solutions were used in the determination of equimolar amino-sugar solutions according to method (1). Figs. 2 and 3 show how the amount of chromogen produced and the glucosamine values for each amino-sugar depended on the *p*H of the buffer used. Glucosamine values for muramic acid were 160 and 64 per cent when buffers with initial *p*H values

Table 1. GLUCOSAMINE VALUES FOR EQUIMOLAR SOLUTIONS OF AMINO-SUGARS DETERMINED BY THREE MODIFICATIONS OF THE ELSON AND MORGAN METHOD

Method	Per cent (at 530 mμ)			
	Muramic acid	Glucosamine-6-phosphate	Galactosamine hydrochloride	Glucosamine hydrochloride
(1) Rondle and Morgan (ref. 1)	48	82	83	100
(2) Rondle and Morgan with sodium bicarbonate + sodium carbonate buffer (ref. 3)	75	96	93	100
(3) Boas (ref. 5)	34	98	69	100

of 8·8 and 9·8 respectively were used, whereas under these conditions values for glucosamine-6-phosphate showed the opposite trend (70 and 100 per cent respectively). Galactosamine gave significantly more colour when a buffer of *p*H 9·6 was used and thus showed an intermediate response.

The amount of coloured derivative formed from an amino-sugar in the Elson and Morgan reaction depends on both the *p*H and concentration of the alkaline salts present during the reaction with acetylacetone. Amino-sugars vary with respect to their stability in alkaline solutions, for example when muramic acid and glucosamine were incubated in 0·1 *N* sodium hydroxide for 1 hr. at 38° C. losses of hexosamine-reacting substance were 90 and 13 per cent respectively. The solution of alkali-treated muramic acid contained ammonia, and after acidifying the mixture with hydrochloric acid, a significant amount of substance was extracted with ether which gave a positive reaction for hydroxy fatty acid. After treatment with copper lime, the ether-extracted material gave a positive reaction for lactic acid[6]. About 10 per cent of the weight of original amino-sugar was recovered as lactic acid, and since significant amounts of this product were not obtained when either glucose or glucosamine was similarly treated it seems probable that the side chain on carbon atom 3 of the hexosamine moiety of 3-O-α-carboxyethylhexosamine[7] is released as lactic acid on treatment with alkali under relatively mild conditions. During this process the hexosamine moiety is destroyed.

From the results reported here it is clear that, particularly in the case of muramic acid, the conditions used for the determination of amino-sugars by the Elson and Morgan reaction should be rigidly controlled. Whenever possible, a pure sample of the amino-sugar being determined should be included as the standard, and the use of independently reported glucosamine values is not recommended.

I am grateful to Prof. W. T. J. Morgan for a sample of galactosamine hydrochloride and to Mr. A. G. Ness for some analyses.

PHYSICAL INCOMPLETENESS OF INFLUENZA VIRUS PROPAGATED IN DE-EMBRYONATED EGGS

By MARTIN HANIG and JOSEPH M. STEIM

Department of Biophysics, University of Pittsburgh, Pittsburgh 13, Pennsylvania

'FAST' and 'slow' sedimentable components of the *PR*8 strain of type *A* influenza virus may be selectively propagated in de-embryonated eggs[1,2]. Because the 'slow' form lacks several of the biological characteristics of the 'fast' form, it has been called 'incomplete' virus[1]. Hanig and Bernkopf[2] observed that the two forms exhibit 'fast' and 'slow' classes of sedimentation coefficients with overlapping distributions. These authors considered, nevertheless, that the 'fast' and 'slow' classes were distinctly different, and the overlapping was interpreted as resulting from differences in viscosity caused by differences in dilution of the various preparations. 'Incomplete' virus corresponding to slowly sedimenting overlapping components can also be propagated in embryonated eggs[3,4]. This effect has alternatively been ascribed to varying degrees of 'incompleteness' in a physical sense, a most attractive interpretation implying a parallelism in the development of the physical particle and its biological characteristics[5]. This may be the proper explanation for the overlapping observed in 'incomplete' virus propagated in embryonated eggs. Here, a gradual transition from 'complete' to 'incomplete' virus seemingly takes place during the several successive passages which appear to be necessary when using embryonated eggs for propagation[6–9]. In de-embryonated eggs, however, either component may be obtained directly in a single passage and alone, within the resolution of the optical system of the ultra-centrifuge.

Other differences between the two hosts are also apparent. The infectivity to agglutination ratios (*I*/*A*), after 24 hr., employed to characterize the viruses from the successive passages in embryonated eggs, seem to be appreciably lower than the ratios obtained from the 'incomplete' virus directly propagated in de-embryonated eggs. Thus, the mean infectivity to agglutination ratio reported[6–10] is 2·7 for virus from the third passage, the form which typifies the 'incomplete' virus from embryonated eggs. The mean, however, of the infectivity to agglutination ratios reported for the 'incomplete' virus propagated in de-embryonated eggs for the present investigation and elsewhere[1,2] is 5·0. Another, more obvious, difference is that virus grown in de-embryonated eggs is propagated only in the allantoic membrane while that from embryonated eggs may also be formed in other tissues, notably the yolk sac[8].

These differences suggested that, for influenza viruses, extrapolation of interpretations based upon observations in one host to another, even very similar, host may not be a valid procedure without well-considered justification. It then follows that the interpretation of Hanig and Bernkopf[3] that the 'fast' and 'slow' forms of virus propagated in de-embryonated eggs are distinctly different physical entities may be correct. Should this be so, it is evident that if there is a physical transition from one form of the virus to another, it must take place in one discrete, large step rather than in many intermediate steps unless the intermediate forms are transient and unidentifiable. Accordingly, this communication is concerned with a more rigorous investigation than the earlier one[3] concerning the 'fast' and 'slow' forms of *PR*8 virus selectively propagated in de-embryonated eggs.

Variations from preparation to preparation in the sedimentation coefficients of influenza virus may be caused by the intrinsic viscosity of the virus solutions *per se*[11] determined at different concentrations. Concomitantly, variations may be caused also by the presence of extremely viscous contaminants such as the normal 30 *S* component[12,13]. It is to be expected, then, that the sedimentation coefficients determined at a number of decreasing concentrations for a single preparation and extrapolated to infinite dilution would eliminate both viscous effects and would yield values more representative of the 'fast' and 'slow' classes of virus.

'Fast' and 'slow' forms of the *PR*8 strain of type *A* influenza virus were propagated in 17-day de-embryonated eggs for 24 hr. by the method of Bernkopf[3] employing inocula diluted to 10^{-5} and 10^{-1}, respectively. Each of four preparations of eight dozen eggs yielded about 1,600 ml. of the 'fast' component. A similar four preparations of the 'slow' component were prepared. Purification and concentration were accomplished by (*a*) two, three or four alternate high- and low-speed centrifugations at 4° C., or (*b*) a combination of these preceded by adsorption and elution from chicken erythrocytes. One preparation of the 'fast' component was divided in half and each portion was purified by (*a*) and (*b*). The sedimentation coefficients at infinite dilution ($S^{w}_{20}\,\infty$) were not significantly different for the two halves, 688 and 695 (Table 1, 6, 6*a*) indicating that the method of preparation probably had little effect on the sedimentation coefficient at infinite dilution. All operations were carried out in *p*H 7·4, *M*/15 phosphate buffer as follows: (*a*) infectivity was titrated in embryonated eggs[1] and calculated according to the Reed and Muench method[14]; (*b*) hæmagglutinating activity was measured by a modification of Salk's method[17].

Each preparation of virus of 6–8 mgm./ml. was diluted into five aliquots of decreasing concentrations in *p*H 7·4, *M*/15 phosphate buffer[15]. The uncorrected sedimentation coefficients, *S*, were determined at 20° C. in a Spinco model *E* analytical ultra-centrifuge employing a Philpot–Svensen optical system. Exposures were made at 4-min. intervals for 10 sec. at 12,590 r.p.m. Bar angles varied from 30°–45° depending upon the concentration of the sample in a 2°, 12 mm. cell. Both 'fast' and 'slow' components exhibited typical influenza virus boundaries in that there was considerable flattening of the schlieren peaks during a determination. No difficulty was encountered, however, in locating the maxima of the patterns. For each preparation *S* was plotted against *C* and extrapolated to infinite dilution by the method of least squares. In the range of concentrations employed, the curves were essentially linear whether plotted as $1/S$ versus *C*, or *S* versus *C*. The extrapolated values of *S* were corrected to the viscosity and density of water at 20° C. using $\rho_{20} = 1·0081$ and $\eta_{20} = 1·0467$ centipoise for the stock *p*H 7·4, *M*/15 phosphate buffer.

In calculating *S* for the 'fast' and 'slow' forms the apparent partial specific volume, $\bar{V}$, employed was 0·80 for both forms. This is the mean value of $\bar{V}$ reported by Lauffer and Stanley[16] for the 'fast' component propagated in embryonated eggs and the 'slow' form propagated by us in de-embryonated eggs. We were compelled to resort to this device because of insufficient 'fast' material from de-embryonated eggs on which to complete a determination. The value reported by Lauffer and Stanley was $\bar{V} = 0·79$ and that determined by us employing identical procedures was $\bar{V} = 0·806$. Because of the intrinsic experimental uncertainties in the determination of $\bar{V}$, we have considered these two values to be not significantly different from each other or from the 'fast' form in de-embryonated eggs, and have arbitrarily assigned $\bar{V} = 0·80$ to both our 'fast' and 'slow' components. Calculations of the sedimentation coefficient at infinite dilution using the separate values of $\bar{V}$ in no way affects the interpretation of the results.

The results of the extrapolations of the sedimentation coefficients to infinite dilution (Table 1, Fig. 1) show that the two forms of virus fall into two discrete distributions. That produced from the 10^{-4} inoculum has a mean of 697 svedbergs, and that from the 10^{-1} inoculum a mean of 541 svedbergs with standard errors of the mean, SE_{m}, of 4·3 and 4·1, respectively. This difference in sedimentation behaviour is quite unambiguous. Statistical analysis for the significance of the difference between means shows that $t = 14·97$. Indeed, even when the extreme values of the two distributions that most closely approach one another, rather than the means, are chosen to calculate *t*, the result is still clear, $t = 12·60$. Both these values of *t* are beyond the limits of conventional tables of probability and correspond to $P < 0·001$ so that the

two distributions could be from the same population. In view of these results, the hypothesis[6,7,10] that overlapping continuous values of sedimentation coefficients for the two forms of virus are indicative of biological transitions of 'incompleteness' is untenable for virus propagated in de-embryonated eggs. The ranges of S reported earlier for the 'fast' and 'slow' forms of virus were correctly interpreted by Hanig and Bernkopf[2]. They arise simply from the dependence of S upon concentration in the ultracentrifuge cell.

It is still possible that virus with many intermediate sedimentation coefficients could be produced by inocula of dilutions intermediate between 10^{-1} and 10^{-4}. This experiment has not been performed in de-embryonated eggs. In embryonated eggs, inocula diluted to 10^{-3} result in two distinct components which sediment concurrently and which correspond to the 'fast' and 'slow' components of de-embryonated eggs[2,16]. In an extensive study, Gard *et al.*[10] have reported for 'incomplete' *PR*8 virus obtained from embryonated eggs that the sedimentation coefficients ranged widely when extrapolated to infinite dilution. They do not, however, report details of their extrapolation procedures, so that a comparison of their results with ours, unfortunately, is not possible.

On the basis of the data available, it is valid only to state that for embryonated eggs there may or may not be continuous transitions from one form of the virus to the other and that the 'fast' form ranged from 757 to 810 svedbergs, while the 'slow' form ranged from 430 to 679. For the two forms of virus propagated in de-embryonated eggs, however, it is clear that they are completely disparate with $S^{w}_{20}\infty = 697 \pm 4{\cdot}3$ and $541 \pm 4{\cdot}1$. It is also clear that any hypothesis which attempts to explain a physical transition of one form of virus into the other when propagated in de-embryonated eggs must consider strongly the evidence that the transition probably would take place in a single, large, discrete step. At present, a conservative interpretation would be simply that, in the de-embryonated allantoic membrane, concurrent biological and physical developments proceed up to a certain point in the cell and then stop before release. The inoculum diluted 10^{-1} results in the physically 'slow' and biologically 'incomplete' form. The inoculum diluted 10^{-4} goes a discrete step further resulting in release of the physically 'fast' and biologically 'complete' virus. In embryonated eggs an inoculum diluted 10^{-3} results in the concurrent growth of both discretely different forms before release from the host cells.

Thus sedimentation coefficients extrapolated to infinite dilution have clearly demonstrated that there is no detectable gradual transition in $S^{w}_{20}\infty$ from one component to the other. Rather, the probability is much less than 1 in 1,000 that the two distributions, $541 \pm 4{\cdot}1$ and $697 \pm 4{\cdot}3$, could be from the same population. It follows from this that any hypothesis attempting to explain a physical transition of one form of virus to the other when propagated in the allantois must consider the evidence that the transition most probably would take place in a single, large, discrete step.

This investigation was supported by research grant *H*-2789 from the National Heart Institute of the National Institutes of Health, United States Public Health Service, and taken in part from a thesis submitted by one of us (J. M. S.) to the Graduate School of the University of Pittsburgh for the degree of master of science.

BIOLOGICAL FUNCTION OF FRUIT

By DR. I. GINDEL

Agricultural Research Station, Rehovot, Israel

RESEARCH work carried out by me has revealed the accepted conceptions concerning the biological function of fruit, that is, the influence of the fruit on seed germination, to be misleading. It should be kept in mind that many cultivated fruits have changed entirely from their original form. This is particularly true of fruits having a pulpy pericarp, which, through selection, hybridization and cultivation, has steadily increased in size, for example, apple, peach, pear, etc. Thus only an ecological approach, a study of the fruit in its natural form and habitat, can elucidate its biological functions.

The developmental cycle of fruit may be divided into four periods: (1) from fertilization until final development in size; (2) the period of chemical changes within the fruit, partly visible to the naked eye by changes in colour of the fruit; (3) the period of final fruit ripening during which a corky layer is

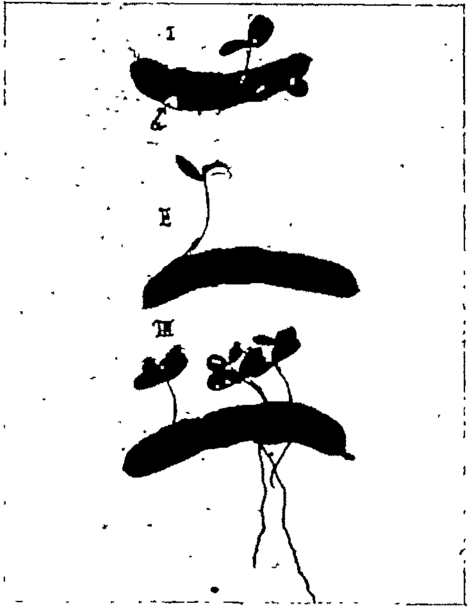

Fig. 1. Three developmental stages of the carob bean germ

formed between the pedicel of the fruit and the branch of the mother-tree ; (4) the period of chemical changes in the fruit when found on its natural litter.

While relatively sufficient information is available on the first three periods, data are scarce with regard to the fourth one. Research has been confined to the period when the fruit is best suited for consumption, or in determining storage conditions most suitable for preserving the fruit.

Fruits from indigenous indehiscent forest-trees and shrub species were collected soon after they had matured and stored at room temperature until sowing. One hundred fruits from each tree sample were sown in sandy seed-beds on the grounds of the Agricultural Research Station, Rehovot.

Fig. 2. A germ breaking through the split stony coat of a mango seed

Only healthy whole fruits were used, since my assumption is that the fruit represents a vital organism which, like the seed, continues to live after reaching maturity.

These experiments were supported by observations on the seeds of various fruit trees grown in Israel, for example, apple, anona, avocado, melon, tomato, pumpkin, grapefruits, lemons, *Artocarpus integrifolia* and others. These fruits were left in various storage conditions until maturity and carefully cut to see if their seeds had meanwhile germinated.

Table 1 shows percentage germination of various forest seeds when left within their fruits. Only the seeds of fruits not attacked by fungi or insects germinated. The low percentage obtained is not representative for the various species as the fruits were sown in poor sand ; on natural litter percentage of germination would obviously have been greater.

Table 1. GERMINATION OF SEEDS WITHIN THEIR FRUITS

Species	Germination (per cent)	Length (days)
Arbutus andrachne	32	62
Celtis australis	78	102
Ceratonia siliqua	9	76
Elaeagnus angustifolia	14	49
Laurus nobilis	19	106
Melia azedarach	64	61
Pyrus syriaca	40	102
Rhamnus alaternus	44	61

Fig. 1 shows the developmental stages of the carob bean germ. Fig. 2 shows a germ breaking through the split stony coat of a large mango seed.

When testing fruits of *Arbutus andrachne*, *Ceratonia siliqua* and *Mangifera indica*, the seeds of which germinated in the sown beds, we found that, before sowing, their pH was 4·12, 4·85 and 4·2, respectively. After germination within the fruits their pH increased to 5·38, 6·34 and 5·5, respectively. Even the germination of the seed of the avocado in its fruit is no rare occurrence. In this fruit there is a pH change after harvesting from 6·8 to 7·05 at the time of germination of the seed.

Germination of seeds within the fruit itself was observed in tomato, apple, *Cucurbita maxima*, avocado, anona, grapefruit and lemon. Within the last two fruits green cotyledons developed from the germinating seeds when the fleshy pericarp was still entirely closed. The roots of the germs were in all cases tightly attached and had partly penetrated into the body of the fruit.

From our experiments and observations it seems therefore clear that the so-called inhibiting substances which prevent the seed from germinating change, in the course of the metabolism of the fruit, into new compounds which favour seed germination. The biochemical composition of the fruit reaches a stage whereby the radicle of the germ is enabled to come in touch with the pulpy content of the fruit and thus provide it with its first food before it reaches the mineral soil in the forest litter.

It appears, therefore, that the fruit is naturally a disseminating organ the structure of which is adjusted to the ecological conditions of its habitat. The better results obtained by extracting the seeds artificially should not diminish the positive function of the fruit in Nature as a disseminating organ.

The supposition that flavour and taste of fruit attract the senses of animal and man to eat and disseminate the fruit is therefore not necessarily justified, and it is only a happy accident in Nature that man or animal consumes the fruit at a stage suitable to his taste. The conclusion drawn by different workers that the fruit in Nature is an inhibitor to the germination of its seeds or should be destroyed by insects or fungi and freed for germination also does not seem warranted.

Examining the sown fruits from time to time showed that seed germination occurred wherever the fruit was fresh. On the other hand, wherever germination did not take place, the fruit was found to have been destroyed by fungi or insects. Within the germinating fruit the roots steadily increased in size by making use of the food in the pulpy pericarp, many of these roots branching within the fruits rather than penetrating the soil through the perforated coat.

AUSTRALIAN BIVALVE GASTROPODS

By ROBERT BURN*

As already intimated by me (*Nature*, April 9, p. 179), *Edenttellina typica* Gatliff and Gabriel[1] has been collected alive at Torquay, Victoria, and it is congeneric with the Japanese *Tamanovalva limax* Kawaguti and Baba[2]. Thus the latter genus is a synonym of the former. Furthermore, I suggest that the Victorian and Japanese species are conspecific with *Edenttellina corallensis* Hedley[3] from Queensland and *Scintilla ? chloris* Dall[4] from California, but not with *Edenttellina typica* as described and figured from South Australia by Verco[5] and Hedley[6]. My reasons for suggesting this synonymy are given in the discussion following the description of the Victorian species.

Overseas correspondents inform me that the Eocene Paris Basin fossil genus *Berthelinia* Crosse[6] is applicable to the present species, and with this I wholly agree. This means that the two synonymous recent genera must themselves become synonyms of this earlier name. It is then under this genus that I thus describe the animal and shell of the Victorian species: *Berthelinia typica* (Gatliff and Gabriel).

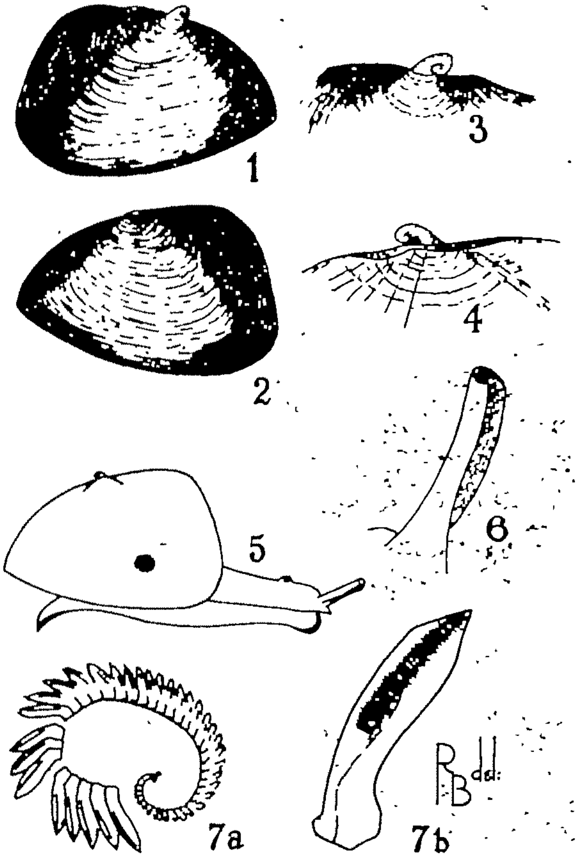
Notice of a second species from the same habitat was also given in my communication in *Nature* of April 9. This species presents a new problem within the order Sacoglossa, for the protoconch, although always present on the umbo of the left valve, shows lateral torsion away from the vertical plane of the initial whorl. Together with other shell characteristics and the very different animal, the species deserves generic separation, and to this end I propose the name *Midorigai australis gen. et sp. nov.* for it. *Midorigai* is chosen to perpetuate the Japanese ordinal name for the sacoglossan opisthobranchs.

A specimen of each species has been presented to the Japanese authors in exchange for topotypes of their own find. The remainder of the material, including the exchanges, has been presented to the National Museum of Victoria, Melbourne.

I wish to thank Mr. C. J. Gabriel of Melbourne for allowing me to examine cotypes and topotypes of both *Edenttellina typica* and *E. corallensis* from his collection. To Tom Iredale of Sydney go my special thanks for directing my attention to this matter in the first place and for urging me to try to resolve the *Edenttellina–Tamanovalva* problem.

Berthelinia typica (Gatliff and Gabriel)

The animal (Figs. 1–7) does not differ essentially from that described for *Tamanovalva limax* Kawaguti and Baba (ref. 2, 179–180, Fig. 1, 4–5). The few points of difference are: (1) the smaller size of the whole animal; (2) the more elevated rounded protuberance upon the neck containing the eyes; and (3) the slightly larger and broadly pointed oral tentacles. The length of my largest specimen is 6 mm. The body colour is leaf-green; the neck, transparent edges of the foot and the mantle inside the shell are minutely speckled with cream pigment. The rhinophores have larger denser patches of creamy yellow towards the tips, while the lateral slit is similarly pigmented. The mantle in each valve

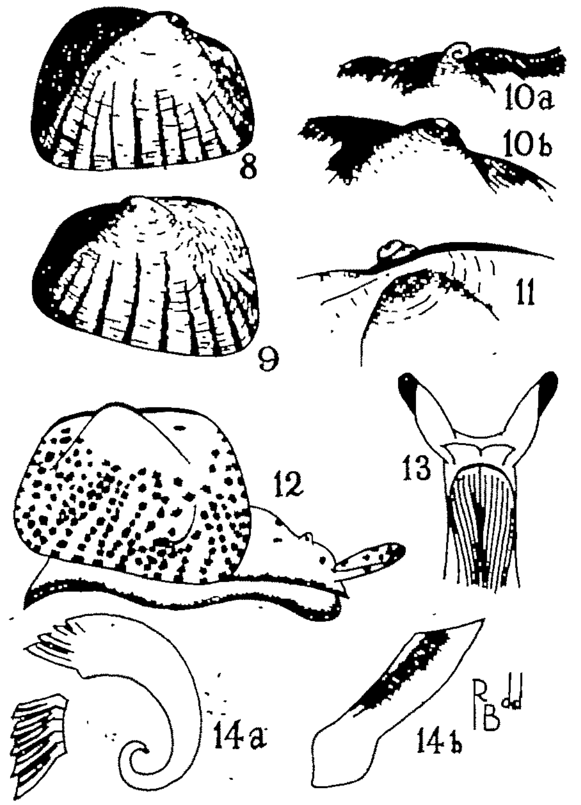


Berthelinia typica (Gatliff and Gabriel).

(1) Left valve of shell. (2) Right valve of shell. (3) Detail of protoconch on umbo of left valve. (4) Detail of hinge line of left valve. (5) Living animal from right side. (6) Dorsal aspect of right rhinophore. (7) Radula: *a*, complete series; *b*, detail of a large tooth

---

* Present address: 24 Autumn Street, Geelong West, Victoria, Australia.



Midorigai australis gen. et sp. nov.

(8) Left valve of shell. (9) Right valve of shell. (10) Detail of protoconch: *a*, dorsal aspect; *b*, lateral aspect. (11) Detail of hinge line of left valve. (12) Living animal from right side. (13) Underside of head and anterior foot. (14) Radula: *a*, complete series; *b*, detail of a large tooth

contains red pigment cells in patches of varying area; in some specimens the whole mantle is thus red pigmented. The adductor muscle shows as a grey-blue circular patch on each valve.

The radula contains 41 or more teeth similar to those of *T. limax* (*loc. cit.*, Fig. 8). The spiral series of teeth is broken into three sections, 6 large teeth in the lower series, 3 similarly sized teeth in the ascending series, and 32 or more evanescent teeth in the descending series.

The shell is as figured by each of the authors cited and I add figures of the present specimens (Figs. 1–4). The protoconch is elevated, erect, of 1¼ whorls in the vertical plane. The valves are smooth with fine growth lines visible. The adductor muscle is firmly attached to the left valve and easily detached from the right, the scar is circular, nacreous inside the valves and visible externally. There are no teeth in the hinge line. There is a strong leathery transparent periostracum over each valve, the thickening and strengthening of which provides the ligament upon which the valves hinge at the umbones. The largest shell measures 5 mm. long, 2·5 mm. high and over the paired valves 1·5 mm. The shell is pale translucent olive-green, the protoconch white, the ligament brown and the periostracum colourless or pale horn colour.

Material examined: 1 specimen, Torquay, February 2, 1960; 3 specimens, Torquay, March 5, 1960.

The species lives on the green alga *Caulerpa scalpelliformis* (R. Brn.) C. Ag. which grows either in isolated colonies of a few leaves in the narrow crevices between rocks or as single stipes some little distance apart among the denser brown algae on the top of rocks, in the channels at the outer edge of the reef where there is strong tidal influence. The small specimens live upon the pale green stalks and roots of the alga; consequently these specimens are paler in colour. The adult specimens feed on the sharp flat sword-like edges of the alga; a minute hole is pierced by the radula and the surface juices are sucked out, leaving a narrow band easily discernible by its yellowish colouring. The animal when irritated exudes great quantities of white viscous fluid from the hyperbranchial ducts opening on the posterio-ventral margins of the mantle. At rest, the species retracts the head within the shell, which takes up a vertical position on the alga, as though attached by a strong byssus; in this attitude it resembles most closely a small green species of Pelecypoda.

Crosse[6], originally described *Berthelinia* from a single juvenile valve; later, together with Fischer[7], he described the complete shell, clearly indicating the position, shape and size of the adductor muscle scar, and most important, the erect protoconch in the vertical plane of the valve. There can be no doubt that this genus is applicable to the present species. The comparison of the Victorian and Japanese species clearly indicates that they are congeneric and, except for a few minor points, conspecific. I have dissected out and examined the radula of each species, and I find that both contain a similar number of teeth, 41 or more, which is more than indicated by Kawaguti and Baba. That the teeth are in three series in both radulae is possibly due to the contraction of the body during preservation, but as *Midorigai australis* preserved in the same manner exhibited only two series, I feel that the three series may be a generic characteristic.

Although the Japanese authors do not mention it, I find that there is a thin transparent periostracum present on each of the valves of *Tamanovalva limax*, and that it is thickened in the same way as in my specimens, thus providing the 'invisible' ligament. It is quite possible that Verco's South Australian specimens are not this species, but instead are some new species with teeth in the hinge line and a large vertical protoconch of about two whorls; the shell is also more attenuated posteriorly, and the adductor muscle scar and the animal are unknown. The South Australian specimens described first by Verco and later by Hedley cannot be traced at the present time.

My specimens and the Japanese topotypes resemble most closely *Edentellina corallensis* Hedley; the topotypes of this species in Mr. Gabriel's collection cannot be separated in any real way from *Berthelinia typica* cotypes in the same collection. Thus I must reduce *E. corallensis* and also *T. limax* to synonyms of *B. typica*. The Californian *Scintilla ? chloris* Dall is larger, length 9 mm., but is still remarkably similar to the present species, and I think should be added to the synonymy of it.

Midorigai gen. nov.

This new genus is proposed for those sacoglossan slugs similar to *Berthelinia*, but with the following differences. The shell is more obese, the shape more square, the protoconch very much smaller and in a nearly horizontal plane across the hinge line of the two valves. There are two adductor muscles; the lower, larger one is horizontally oval, with an anterior flange rising up towards the upper, much smaller, muscle just below the anterior hinge line. The foot is narrower than the neck. The rhinophores are stout and at mid-length swollen; the oral tentacles are large and pointed. The vaginal pore is in front of the lower adductor muscle. Radula is as usual in the Sacoglossa, teeth more coarsely denticulate laterally than in *Berthelinia*. Body-colour is dark green, the mantle within the shell is spotted with large cream spots, the neck and rhinophores with a few paler cream patches.

Midorigai australis sp. nov.

In the type species (Figs. 8–14) the body is stout and the foot is nearly as wide as the neck. The neck is high and rises up towards the shell from immediately behind the eye prominence. The eye prominence is broadly elevated and close to the rhinophore bases. The auriculate rhinophores are stout, swollen at mid-length with the bases constricted; the tips are rounded and not square as in the previous species. The oral tentacles are large, square-lobate with the anterio-lateral corners sharply pointed. The anterior edge of the foot is bilabiate, the upper lip medianly slit, the lower continuous and rounded in shape. The sole is medianly grooved for its whole length; on each side of this groove there are six faint grooves originating near the anterior end of the foot, and these carry the mucus or pedal fluids from the glands within the bilabiation of the anterior part of the foot. The foot is flattened anteriorly and folded along the median groove posteriorly. The penial aperture is behind the right rhinophore base, but in front of the level of the eyes; the vaginal pore is small and in front of the lower adductor muscle. The tail of the foot is very little shorter than the posterior of the shell. The length of the largest animal was 5·5 mm. The anus opens above the posterior ridge of the foot within the shell. The ducts from the hyperbranchial glands open in the margins of the mantle behind the anus. The gill is bluish, larger than in *B. typica*, and situated between the anus and the adductor muscles. The lower larger adductor muscle is placed in the anterior part of the shell, but rather far back from the anterior margin; it is horizontally oval with an anterior flange of muscle running forward and curving upwards to the much smaller elongate-oval adductor muscle near the hinge line. This latter muscle can be observed by careful scrutiny of the living animal.

The radula has as usual two series of teeth in its uniseriate spiral. There are 5 teeth in the ascending series, and about 34 in the descending series; the whole spiral is more tightly coiled than in *B. typica*. The teeth are coarsely denticulate laterally, the tips being sharply angled towards the cutting edge.

The body colour is dark green, the rhinophores have large yellowish patches spread sparsely over them, and patches of the same size extend over the body. The mantle within the valves is densely spotted with large rounded spots of yellow-cream; some of these form wavy series which originate in the squarish yellow patches unequally spread along the mantle edges. The sole is pale green, the anterior edge of the foot whitish. The eye prominence is white, the eyes black.

The shell of the largest specimen measures 4·4 mm. long, 3 mm. umboventrally and 1·75 mm. broad. The left valve is the more convex of the two and is a little higher at the hinge line than the right, which fits under this higher upper edge; the ligament thus takes a vertical position, not a horizontal position as in *B. typica*. The protoconch is small and flatly coiled in its horizontal position on top of the umbo of the left valve; it encroaches upon the right valve for half its diameter. There is a strong translucent periostracum over the thin valves, which is strengthened and is coloured dark brown where it forms the ligament. The ligament extends twice as far in front of the umbo as behind it. There are no teeth in the hinge line. The valves are pale translucent olive-green with darker rays of green radiating out from the umboes. The protoconch is yellowish and thus inconspicuous. The interior of the valves is nacreous, particularly the lower adductor muscle scar.

Material examined: 1 specimen (holotype) Torquay, February 21, 1960; 5 specimens (paratypes) Flinders, Victoria, March 20, 1960; 1 specimen Torquay, April 2, 1960.

At Torquay this species lives upon the green alga *Caulerpa scalpelliformis* along with *Berthelinia typica* and the oxynoid sacoglossan *Oxynoe viridis* (Pease). At Flinders it lives upon the tender tips and needle-like leaves of the 'rat-tail' green algae *Caulerpa brownii* (C. Ag.) Endl. and *C. simpliciuscula* (Turn.) C. Ag. Both these algae grow outwards from the vertical walls of deep rock pools and channels at the extreme edge of the reef at Flinders. The animal exudes copious quantities of white viscous fluid from the posterior gape of the shell. The ventral margin of the closed valves gapes a little to allow the foot to protrude. In motion, the foot is thrust forward and the shell drawn towards the head in two or three jerky movements. The right valve contains none of the viscera.

This species can be separated from *Berthelinia* by the following criteria: (1) the small protoconch placed half on the right valve; (2) the right valve smaller than the left; (3) the foot narrower than the neck; (4) the swollen rhinophores; (5) the two adductor muscles; (6) the two series of teeth in the radula; and (7) the darker colouring and the spotting within the shell. Perhaps the shell both Verco and Hedley called *Edentellina typica* is more closely related to this species than to *Berthelinia*.

That a second genus and species should occur along with one known for fifty years is truly remarkable, but no more so than the plentiful occurrence of *Berthelinia typica* (= *Tamanovalva limax*) in Japanese waters. Wider researches in similar habitats will probably reveal more forms of the same types as those described here.

Note added in proof. Dr. K. Baba, of Osaka (*in litt.*, received May 25, 1960) considers *B. typica* to differ specifically from *B. limax* because of its different shell shape and somewhat differently formed apices of the radular teeth. I regard these two species as the known extremes of zoogeographical variation within a single species, with *B. corallensis* and *B. chloris* as intermediate intergrading forms. Further material of all forms will perhaps allay the present differences of opinion.

LETTERS TO THE EDITORS

ASTRONOMY

Origin of the Solar System

There is a considerable degree of order in the solar system which current theories seem capable of explaining only in part. The present communication describes a new approach which has led to a proposed model for its formation which seems to be much more successful in explaining the regularities observed.

This model, in common with some others which have been advanced, envisages the passage of a star into the neighbourhood of the Sun. The order of magnitudes under consideration at present envisages a star of one hundred Sun masses moving with a velocity of 100 km./sec. and approaching the Sun to within a distance of ten times the solar radius. The Sun is imagined as initially spinning about an axis not in the plane of the orbit of the star. A tide is raised on the surface of the Sun which increases in height as the star approaches. Eventually a position is reached where a portion at the tip of the tidal bulge facing the Sun is under a greater gravitational pull from the star than from the Sun itself, and this portion then breaks away and, moving under the combined gravitational attractions of the star and the Sun, forms the planet Pluto.

This loss of material at the solar surface sets up waves which will travel around the Sun from the unaffected obverse tidal bulge towards that part of the Sun facing the oncoming star. The wave-crest approaches the oncoming star which eventually draws off another portion of the solar material to form the planet Neptune. A new wave is initiated to give the planet Uranus, and then Saturn and Jupiter are formed in a similar way. At this stage the star is approaching most closely and is able to draw material out from the Sun almost continuously, a great deal of which material it may even capture. Indeed a large planet could have been formed at this stage and captured by the star. The residue of the ejected material forms the belt of asteroids, which lie for the most part between the orbits of Jupiter and Mars. Finally, as the star recedes, the four smaller planets—Mars, Earth, Venus and Mercury—are formed.

Fig. 1 shows the possible scheme of operation. It is hoped that the regular time-intervals between the production of each planet will account for the well-known but hitherto unexplained Bode's law. In support of this idea it may be noted that the same law, with different constants, also applies to the innermost satellites of those planets possessing appreciable satellite systems (Table 1). The proposed mechanism for their formation is similar to that given above, but with the planet itself acting as the parent body. However, the agreement with Bode's law is not so precise because of the perturbing influence of the Sun.

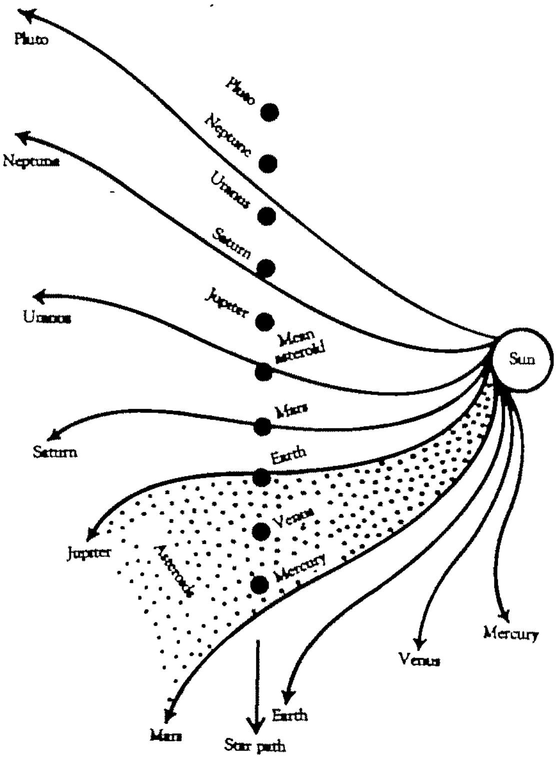

Fig. 1. Suggested scheme for the origin of the solar system. The position of the passing star when each planet leaves the Sun is indicated by ●

An interesting point concerns the time taken by the whole process. If the waves on the surface of the Sun are considered as gravity waves on a deep liquid of wave-length equal to the circumference of the Sun, travelling a distance equal to one half the circumference, it is found that the time for the journey of each wave is about 80 min. Thus the material for the formation of the planets will have been removed from the Sun in a total time of 12 hr. Of course, many hundreds of years will have elapsed after the passage of the star before Pluto, the outermost planet, had completed its first orbit.

Full consideration of the model gives reasonable qualitative explanations for the following observed

Table 1

Jupiter			Saturn			Uranus		
Satellite	Bode-type law	Orbit radius (× 10⁴ km.)	Satellite	Bode-type law	Orbit radius (× 10⁴ km.)	Satellite	Bode-type law	Orbit radius (× 10⁴ km.)
1	19 + 0 = 19	18·1	1 (Mimas)	18·6 + 0 = 18·6	18·6	1 (Miranda)	14 + 0 = 14	13·0
2 (Io)	19 + 22 = 41	42·2	2 (Enceladus)	18·6 + 4·8 = 23·4	23·8	2 (Ariel)	14 + 6 = 20	19·2
3 (Europa)	19 + 44 = 63	67·1	3 (Tethys)	18·6 + 9·6 = 28·2	29·5	3 (Umbriel)	14 + 12 = 26	26·7
4 (Ganymede)	19 + 88 = 107	107·1	4 (Dione)	18·6 + 19·2 = 37·8	37·8	4 (Titania)	14 + 24 = 38	43·9
5 (Callisto)	19 + 176 = 195	188·4	5 (Rhea)	18·6 + 38·4 = 57·0	52·7	5 (Oberon)	14 + 48 = 62	58·7

phenomena and physical properties of the solar system: (i) The occurrence of a law (it is hoped Bode's law) for the radii of the planetary and satellite orbits. This is a result of the regular time-sequence of their production. The departure from the law for the outermost planets is also explained. (ii) The relative masses of the planets (including Mars) and of the satellites in each system. (iii) The large eccentricities of the orbits of Mercury and Pluto. (iv) The inclinations of the planetary orbits to the ecliptic. (v) The periods of rotations of the planets about their axes. (vi) The inclination of the planetary equators to their orbits. (vii) The inclination of the solar equator to the ecliptic and the variation of its period of rotation with latitude. (viii) The retrograde spin of Uranus and the retrograde orbits of its satellites. (ix) The retrograde orbit of Triton, the inner satellite of Neptune, and the large eccentricity of its other satellite, Nereid. (x) The origin of the satellites Titan and the Moon.

It is hoped to carry out calculations on the University of Manchester Mercury computer to see whether the basic ideas behind such a system are feasible, and, if so, to find values of the constants that would give an approximation to the system as it exists at present.

I wish to acknowledge the many helpful discussions I have had with Prof. H. Lipson during the period in which these ideas were being formulated.

Note. After this short communication had been prepared, it was found that a communication on a similar topic had appeared in *Nature* of May 21, p. 621, by Egyed. The theory presented here would seem to have the advantage that it explains the origin of the solar system in terms of readily understood physical principles without invoking rather exotic phenomena, such as the variation of G with time. Other observations, for example, the distribution of angular momentum in the solar system, also seem more readily explained by the mechanism proposed here.

PHYSICS

Photo-Injection of Charge into Dielectric Liquids

ALTHOUGH many workers have studied the electrical breakdown of pure highly insulating liquids, few have been concerned with the fundamental processes of charge production and movement. This is because of the experimental limitation set by the extremely low natural conductivity. By applying high electric fields or high-energy radiation the conductivity of very pure dielectric liquids may be enhanced; but in both cases it remains difficult to devise experiments to study the mechanism. The difficulties may be partly overcome by a new method of increasing the conductivity. This is by ultra-violet illumination of the electrodes: some preliminary experiments on this effect are reported in this communication.

Dornte[1] was apparently the only early worker to observe a dependence of the current in pure dielectric liquids on ultra-violet radiation. More recently, Le Blanc[2] used the effect to measure the charge mobility in liquid n-hexane, but neither of them investigated it further. It has probably been overlooked by other workers because of their use of glass test cells or of air-saturated liquids. It has recently been found that the ultra-violet photocurrents can be induced in a dielectric liquid only if it is thoroughly degassed, and for the work described here this was achieved by final distillation at a pressure of less than 10^{-6} mm. mercury. Similarly, dissolved oxygen has been shown to be a critical impurity in the electrical breakdown of pure liquids[3].

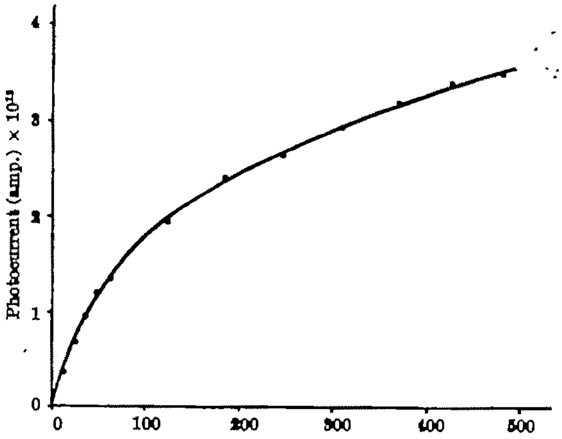

Fig. 1. Typical variation of photocurrent with applied voltage (1-cm. diam. electrodes spaced 7 mm. apart)

The liquid used in the present work was highly purified n-hexane having a residual conductivity of 10^{-16}–10^{-17} mho/cm. With low applied fields the current can be increased by a factor of at least 10^3 by focusing the ultra-violet radiation from a medium-power mercury discharge lamp on to the cathode. The photocurrent varies markedly with voltage as shown by the typical result of Fig. 1. The cell used for this work was completely sealed off at a pressure of 10^{-6} mm. after filling with the degassed liquid. By freezing out the hexane in a side bulb with liquid nitrogen the photoelectric emission from the same cathode could be studied in a good vacuum. As expected, the photocurrent in vacuum shows good saturation with voltage, and with a field of 170 V./cm. the currents are between 200 and 2,000 times greater than in the liquid for the same illumination.

By using optical filters it has been possible to obtain a rough measure of the spectral response for the photocurrent in both cases. For an aluminium cathode in vacuum the photoelectric threshold corresponded to a work function of about 4·1 eV. Approximately the same long-wave threshold was obtained for the photocurrent induced in hexane with a low applied field. There is no doubt that photocurrents are produced in the liquid by radiation of wave-lengths up to 3000 Å., that is, far beyond the absorption limit (~2000 Å.) for the liquid itself. This indicates that the current originates at the cathode, but the lack of saturation, and other features to be described, show that the process is very different from photoelectric emission into a vacuum. For this reason the release of charge from the cathode into the liquid is better described by the term 'photo-injection'.

Further investigation of the spectral response of the liquid photocurrent has indicated that the threshold wave-length increases slightly as the applied voltage is increased, although the effect contributes only very little to the lack of saturation shown in Fig. 1. It has also been found that the form of the dependence upon voltage varies with wave-length. For example, the curve of Fig. 1 was obtained using the unfiltered radiation from a mercury lamp, but a more nearly ohmic characteristic is obtained by isolating wave-lengths near the threshold.

The transient response of the photocurrent on suddenly illuminating the cathode has also been studied, and this can be related to the charge mobility as measured by Le Blanc[2]. With the equipment used so far it has only been possible to record transit times of the order of seconds for the movement of the injected charge between the electrodes. This has indicated a mobility of about 5×10^{-4} cm.^{2}/volt sec. at room temperature, that is, slightly lower than found by Le Blanc. However, it is disturbing to find that with very low applied fields the transit time appears to depend on the wave-length of the ultra-violet illumination. The transients are further complicated by slow variations with time.

From these measurements there appears to be no doubt that photo-injection of charge into a dielectric liquid is possible. The dependence upon voltage shows, however, that it is not justified to assume, as is commonly done[4], that electron emission into a liquid is similar to that into vacuum. The injection of charge through a space charge barrier at the interface of the liquid and the metal seems much more likely[5], but many experiments are required before it is possible to work out the details. The ability to inject charge into a dielectric liquid opens up several interesting possibilities for investigating charge movement. Further work is being carried out and will be reported in more detail elsewhere.

This work was made possible by the award of the Henley Research Fellowship and by the loan of apparatus from the Central Research Fund of the University of London.

An Ionization Detector for Permanent Gases

THREE highly sensitive gas ionization methods for the detection of volatile substances have been reported: the hydrogen flame ionization detector[1], the 'argon' detector[2], and the electron affinity ionization detector[3]. These devices are practical and efficient in the measurement of low concentrations of organic vapours; they suffer, however, the disadvantage of a slight or negligible response to most permanent gases. This communication describes a sensitive ionization method of measuring the concentration of all permanent gases, except the noble gases, in an argon carrier-gas stream.

The physical basis of the method is as follows. When argon containing free electrons is exposed to an electrical field, the temperature of the free electrons is rapidly raised to a level far above that of the argon atoms. This is because only a small proportion of the energy gained by the electrons from the field is lost during their elastic collisions with the argon atoms[4]. Collisions between free electrons and the molecules of other gases, except the noble gases, are by contrast non-elastic and result in the loss of a large proportion of the energy of the colliding electron. The addition of a small quantity of some other gas to argon causes, therefore, a reduction of the free-electron temperature at a given field intensity. There are several possible methods for observing variations of the free-electron temperature in argon when it is contaminated with other gases. The quenching of the normal response of an 'argon' detector has been suggested[5]; a more direct method is described here.

An ionization chamber of plane-parallel geometry is filled with argon and contains a source of free electrons. The chamber is connected directly across the input of a d.c. amplifier, and the anode of the chamber fed through a condenser with positive pulses of short duration (between 1 and 10 μsec.). When the chamber contains only pure argon, little or no current is observed to flow; this is because during the short period of the pulse there is insufficient time to permit the deflexion and collection of the fast-moving free electrons. With contaminated argon, however, the electron temperature is lower and they are moving slowly enough to permit their collection during the application of the pulse. The chamber therefore provides a signal current related to the concentration of the contaminant gas.

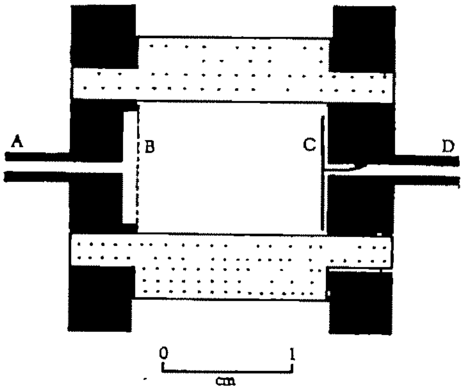

Fig. 1. Construction of the detector. (*A*) Gas inlet and anode connexion; (*B*) gas-flow diffuser made from 100-mesh wire gauze; (*C*) radioactive source; (*D*) gas outlet and cathode connexion. Black, brass; stippled, polytetrafluoroethylene

Fig. 1 shows the construction of a practical detector; its dimensions and the materials of its construction are indicated with the figure. The most convenient shape of electrical pulse to apply to the chamber is a half-wave rectified sine-wave. With a detector of the type illustrated, the frequency of the sine-waves used to generate the pulses should be between 0·2 and 0·7 Mc./s. and the amplitude of the pulses between 50 and 100 volts. Electrons are set free from the argon within the chamber by irradiation with soft β-particles from a sheet of metal foil containing tritium as the active element. The quantity of tritium should be sufficient to provide a d.c. saturation current of between 3 and 10×10^{-9} amp.

Fig. 2 shows the variation of current-flow in the detector with the frequency of the applied pulses. In pure argon no current flows when the frequency is higher than 0·27 Mc./s. When other gases are present at a concentration of 0·1 per cent by volume, there is an extension of the range of frequency over

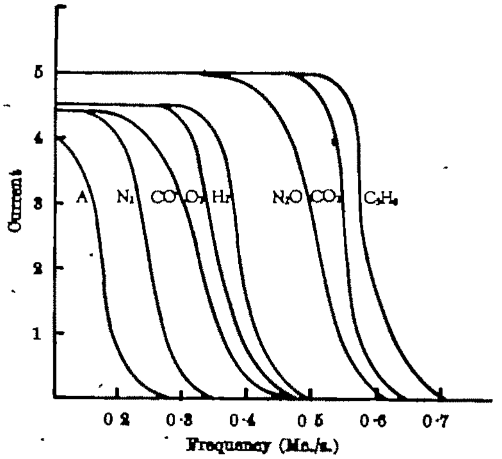

Fig. 2. Response of the detector to pure argon and to 0·1 per cent by volume concentration of various other gases in argon. Abscissa, frequency in Mc./s. of the applied half-wave rectified sine-waves. Ordinate, current drawn from the detector × 10^{8} amp.

which a current flows in the chamber. In general, the more complex the molecule of the contaminant gas the higher the frequency at which a current can still be observed. In practice it is possible to distinguish between such gases as nitrogen, oxygen, carbon dioxide and organic vapours simply by adjusting the frequency of the pulses applied to the detector.

When operated at a frequency of 0·27 Mc./s., the detector illustrated is capable of responding to all but the noble gases. The background current in pure argon is less than 10^{-10} amp. and the noise-level at a total time constant of 1 sec. less than 10^{-13} amp. The least detectable concentration of diatomic and of polyatomic gases in argon is approximately one in 10^7 and one in 10^8 by volume respectively. Helium or nitrogen can replace argon as the carrier gas, but the sensitivity is then greatly reduced.

The response of the detector is linear with gas concentration up to 1 per cent by volume of the diatomic gases. Using the detector illustrated in Fig. 1 the response to polyatomic gases is somewhat non-linear, especially at high frequencies. Recent experiments have shown, however, that the response to the concentration of polyatomic gases is dependent on the dimensions of the chamber and the magnitude of the primary electron current. There is reason for believing that with a modified design a linear response to the concentration of all gases can be achieved.

The device described would appear to have promise as a transducer for the concentration of permanent gases and of vapours such as water vapour which are otherwise difficult to measure.

I am indebted to Dr. S. R. Lipsky, of Yale University, for his advice and suggestions, and to Mr. P. Simmonds for expert technical assistance.

Yield Stress exerted on a Body immersed in a Bingham Fluid

It is well known that finely divided, flocculated, aqueous suspensions of clay behave as Bingham fluids at concentrations less than about 25 per cent by volume. That is, their equation of flow is:

$$S = S_0 + \eta D$$

where S = shear stress applied, S_0 = minimum shear stress which will cause shearing, D = rate of deformation of the suspension, η = plastic viscosity.

Because such suspensions can resist stresses below a maximum value (often called the yield stress) without shearing, they should be able to hold bodies, in a certain range of density and size, stationary within themselves. A body should move only when the difference between its density and that of the suspension is sufficient for it to develop a force greater than that exerted on it through the yield stress of the suspension. The problem is to determine the magnitude of this limiting force, which we will call F_s.

For a cube falling with its faces horizontal and vertical, Yancey, Geer and Sokaski[1] have assumed that the minimum value of F_s would result from the yield stress S_0 acting over the bottom face only of the cube. Meerman[2] suggested that S_0 would act at least over the total vertical area of the cube, and Whitmore[3] that it would act over the whole surface area of the cube. We have so far been unable to find any reference to experimental measurements having been made on bodies, and, in order to test the various ideas, we have made some ourselves.

In our method the body is hung in the suspension by a fine thread attached to the free end of a horizontal wire, the other end being clamped to a bracket which can be raised or lowered on a screw thread. The body is of such a density as to sink in the suspension. When the body is in position in the suspension the free end of the wire is raised slightly then very carefully allowed to fall until the body comes into equilibrium, with F_s acting upwards on it. The bracket is then lowered about 1½ in., and carefully raised to its previous position. F_s is now acting downwards on the body, and the free end of the wire is a distance D_s below its original position. Thus $F_s = c\frac{D_s}{2}$, where c is the proportionality constant of the wire.

If S_0 acts uniformly over a body, the magnitude of F_s should be independent of the orientation of the body. However, measurements on two glass blocks, sized 6·2 × 1·9 × 0·8 cm. and 4·1 × 1·9 × 0·8 cm. in a 20 per cent by weight suspension of 'Supreme' kaolinite clay supplied by English Clays Lovering Pochin and Co., Ltd., showed that the orientation had a big effect on the value of F_s (Table 1). The reproducibility of F_s was in all cases better than ±8 per cent.

Table 1

Block	Horizontal face (cm.²)	F_s (dyne)
A	6·2 × 1·9	3,610
	6·2 × 0·8	2,230
	1·9 × 0·8	1,390
B	4·1 × 1·9	2,690
	4·1 × 0·8	1,420
	1·9 × 0·8	1,120

If it is assumed that different yield stresses prevail on the horizontal and vertical surfaces it can easily be shown that the best values to suit both of the bodies are:

Horizontal-face yield stress 145 ± 15 dyne cm.$^{-2}$
Vertical-face yield stress 29 ± 3 dyne cm.$^{-2}$.

The yield stress as obtained from viscosity measurements made with a Ferranti rotating-cylinder viscometer at 5 rates of shear was 52 dyne cm.$^{-2}$.

Thus it is clear that for suspensions of this type yield stresses obtained from viscometer measurements may not be of much use in predicting instability towards bodies immersed in them. A more detailed examination of this phenomenon is at present being made.

Effect of Electric Fields on Hydrogen-like Excitons

Some substances such as cadmium sulphide show long-range photo-effects; that is, if light falls on a crystal at some point then photo-conductivity can be observed in regions which may be several millimetres away from this point. There has been some dispute as to whether excitons play any part in this process of energy transfer[1]. Recently, Nikitine and Haken[2] have shown that the change of energy of an exciton in a magnetic field due to its diamagnetism may be appreciable compared with the thermal energy kT, at least if the field is high and the temperature low. They suggest that if exciton migration occurs then an inhomogeneous magnetic field should have a detectable effect on it.

We wish to point out that the interaction of an exciton with an electric field may be more easily observed. Suppose the exciton is describable in terms of a hydrogen-like s-function. Then it can be shown that in an electric field F its energy is decreased to a first approximation by:

$$\Delta E \simeq -\frac{9}{4} \kappa a_e^2 F^2 \qquad (1)$$

where κ is the dielectric constant of the crystal and a_e is the effective exciton radius. Since both these quantities can be large, ΔE can be very large. For example, if κ is 10 and a_e is 50 Å. then in a field of 3×10^4 V./cm. the value of ΔE will be equal to the exciton binding energy of 0·014 eV. This means that the perturbation energy is so large that we are already beyond the limit of validity of equation 1 and field ionization of the exciton can occur. The theory of this process for a hydrogen atom has been given by Oppenheimer[3]. Roughly, ionization occurs when the difference of potential energy across the exciton due to the applied field is equal to the binding energy E_b, or:

$$e a_e F_i \simeq E_b \qquad (2)$$

With the parameters used above the threshold field for ionization F_i is 2×10^4 V./cm.

Fields of such magnitude can be applied to a crystal by using external electrodes, but they also arise naturally within the crystal in the potential barriers at grain boundaries. If the density of centres contributing to the space charge in the barrier is 5×10^{16} cm.$^{-3}$ then a barrier height of only 0·1 V. will produce a field of 2×10^4 V./cm. Clearly much higher fields can be produced by applying an external voltage along a crystal containing a transverse grain boundary. The boundary will then attract excitons through the polarization mechanism described by equation 1 and destroy them by the ionization mechanism of equation 2. It will therefore be opaque to excitons but transparent to light, and we have a means of distinguishing between the two.

As an example, we have observed long-range photo-effects in high-resistivity gallium arsenide and have shown that they are entirely unaffected by the presence of a grain boundary. We conclude that in this material the effects are not due to exciton migration. A full account of these experiments will be published elsewhere.

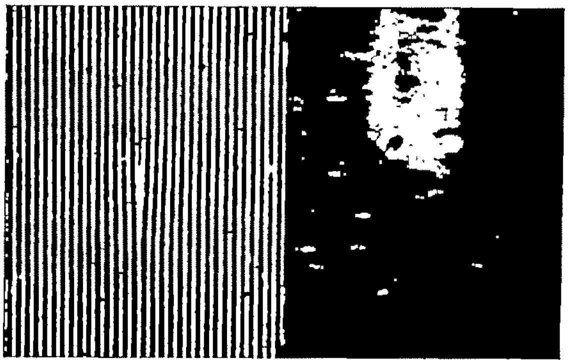
Electron Microscope Images of Dislocations

Hirsch *et al.*[1] and Bollmann[2] observed dark and white spots in the electron microscopic image of thin metallic film, and suggested that the contrast is caused by the Bragg reflexion due to the distorted lattice around a dislocation. We call this, for convenience, *H.-B.* dislocation contrast. Menter[3] first observed an extra terminating half-line in the electron microscope image of platinum phthalocyanine, and suggested that the extra line is the image of the extra terminating half-plane associated with an edge dislocation in the crystal. We call this Menter's dislocation contrast. In Menter's dislocation, no contrast such as *H.-B.* dislocation can be observed.

A plane grating of 66μ spacing was irradiated by an almost parallel light-beam of wave-length 4900 Å. This corresponds to the electron optical system where a thin crystal is irradiated by electrons. Fig. 1*a* is an image of the grating with an extra terminating half-line near its centre which is photographed by allowing the diffracted beams of the order $n = 0$, ± 1, ± 2 to contribute to the image. This corresponds to Menter's dislocation contrast. The diffraction pattern of the grating is illustrated in Fig. 2. In a metal crystal, the spacing of the lattice is about a tenth of that of platinum phthalocyanine, and the Bragg angle of the diffracted electron beam is about ten times larger than that of phthalocyanine. In the image of a metal crystal, therefore, only one diffracted beam is permitted to contribute to the image by the small aperture in the objective lens. Fig. 1*b* shows an image of the same grating which is imaged under the conditions where only one part of a diffracted beam $n = +1$ contributes to the image. This corresponds to a dark-field image showing *H.-B.* dislocation contrast. Thus we are able to



(a) (b)

Fig. 1. a, Amplitude grating with a dislocation near its centre imaged by allowing the diffracted beams of the order $n = 0, \pm 1, \pm 2$, to contribute to the image; b, the same imaged with a stop in back focal plane of lens to permit only a small part of a diffracted beam to pass through to image plane

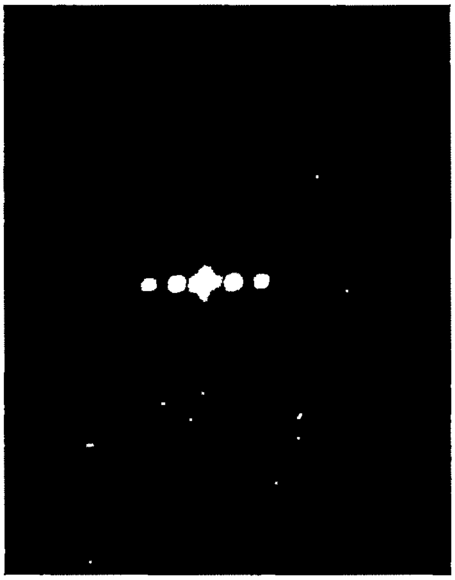


Fig. 2. Diffraction pattern of the grating shown in Fig. 1

produce images similar to those taken by Menter and *H.-B.* from the same grating[4].

In the experiment recorded in Fig. 1*b*, if the whole of a diffracted beam contributes to the image, the contrast shown in Fig. 1*b* will never be observed. However, it may be explained that the contrast of dislocation in plane grating is similar to that of *H.-B.* dislocation contrast of a crystal. The intensity of a diffracted beam from a crystal with sufficient thickness changes by the deviation from the Bragg angle. Therefore, the order of deviation can be detected by the variation of intensity of the diffracted beam, that is, brightness of the electron microscopic image. In a very thin crystal, which may be replaced by a plane grating, deviation from the Bragg angle will not produce the variation of intensity because of uniform intensity cross-section of reciprocal lattice point elongated normal to the crystal surface. In a very thin film, the amount of deviation from the Bragg angle can be detected only by the angular deviation of the diffracted beam from the Bragg angle. Therefore, in order to detect the amount of deviation by the variation of intensity of beam, it is necessary to use the very small aperture so that one part only of the diffracted beam can contribute to the intensity of the image.

In a real crystal the diffracted intensity depends on the crystal lattice potential and crystal thickness in addition to the deviation from the Bragg angle, and for a complete interpretation these quantities must be taken into account. The experiment described here does, however, give a useful qualitative interpretation of how these two types of dislocation contrast arise.

We wish to express our sincere thanks to Prof. K. Tanaka for his kind discussion and to Dr. J. Menter for his helpful discussion and for correcting the English.

METALLURGY

Work-Hardening and Ductility of Rhenium and their Relation to the Behaviours of Other Metals having a Hexagonal Structure

POLYCRYSTALLINE rhenium work-hardens rapidly when tested in tension at room temperature (the proportional limit is 26,000 p.s.i. and the ultimate tensile strength is 164,000 p.s.i.[1]), and has an elongation of 24 per cent. The fracture is intergranular[2]. In the present communication an extension of the study of the mechanical properties of rhenium to single crystals is reported. The behaviour of rhenium is then compared with other metals having a hexagonal structure.

Crystals grown by the electron bombardment technique[3] were deformed in tension, and the dependence of their behaviour on orientation was studied. Slip occurred on the (0001) basal plane and on the $\{10\bar{1}0\}$ prismatic planes in agreement with earlier work in this laboratory on polycrystals[2]; the slip direction was $<11\bar{2}0>$ as with other close-packed-hexagonal metals which slip on these planes (beryllium, magnesium, titanium and zirconium). For each crystal, the first slip system which became operative was noted; this depends on orientation as shown in Fig. 1. From the position of the boundary *AB* it is seen that the critical resolved shear stress for (0001) slip is about half the critical resolved shear stress for

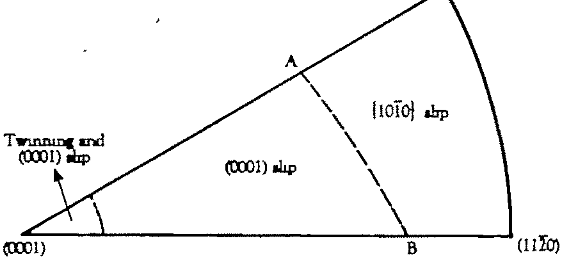

Fig. 1. Initially operative slip system as a function of orientation

$\{10\bar{1}0\}$ slip, the actual values being approximately 1,300 p.s.i. and 2,400 p.s.i. respectively.

All crystals were very ductile with elongations greater than 40 per cent. Specimens oriented with either a $\langle 10\bar{1}0\rangle$ or a $\langle 11\bar{2}0\rangle$ direction parallel to the tensile axis deformed by duplex $\{10\bar{1}0\}$ slip and necked down to a chisel-edge type fracture. In crystals oriented so that slip occurred initially on only one $\{10\bar{1}0\}$ plane the lattice rotated into an orientation which gave duplex $\{10\bar{1}0\}$ slip, leading to a similar fracture. The work-hardening rate was more rapid for slip on a $\{10\bar{1}0\}$ plane than on the (0001) plane, and when duplex $\{10\bar{1}0\}$ slip occurred the rate was greater still.

In contrast with this behaviour of rhenium crystals oriented with a $\langle 11\bar{2}0\rangle$ direction parallel to the tensile axis, similarly oriented beryllium crystals[4] deform by single $\{10\bar{1}0\}$ slip leading to fracture on a $\{11\bar{2}0\}$ plane after elongations of about 10 per cent.

Table 1

Metal	Critical resolved shear stress (p.s.i.)		C.R.S.S. (0001) slip / C.R.S.S. $\{10\bar{1}0\}$ slip	Elongation of polycrystalline metal at room temperature
	(0001) slip	$\{10\bar{1}0\}$ slip		
Beryllium	2,000	9,500	0·21 (ref. 4)	<5 per cent unless of special preferred orientation
Rhenium	1,300	2,400	0·5	25 per cent (ref. 1)
Titanium	9,000	2,000	4·5 (ref. 5)	≏ 50 per cent for iodide titanium (ref. 6)
Zirconium	>4,800	1,300	>3·7 (ref. 7)	≏ 40 per cent for iodide zirconium (ref. 8)

When the behaviours of polycrystalline hexagonal metals which slip on the $\{10\bar{1}0\}$ planes are compared, it appears that the ductility decreases as prism slip becomes more difficult (Table 1). Hauser, Landon and Dorn[9] reached a similar conclusion on comparing magnesium with magnesium base alloys. Such a correlation is compatible with current ideas on fracture; for it is generally believed that for brittle fracture to occur, energy must not be dispersed by plastic flow, and when multiple slip is possible, this dispersion of energy becomes easier.

Borrmann Effect observed in an Aluminium Single Crystal

IN X-ray diffraction studies of a nearly perfect single crystal, Borrmann *et al.*[1] observed anomalous increases in the intensities not only of the diffracted but also of the transmitted ray. This phenomenon was interpreted by Laue[2] from the dynamical theory of X-ray diffraction. Such a dynamical effect on X-ray diffraction, however, has hitherto been observed only on some kinds of natural crystals of good quality. Fortunately, recent techniques are making it possible to obtain substances of high purity, and consequently experimental studies of the dynamical effect are possible without serious difficulty.

In general the crystal structure of a metal single crystal is imperfect, and accordingly the dynamical effect will be negligible. Lately, however, the change in the integrated intensity of X-rays due to cold-working has been examined with aluminium single crystals and a large effect of extinction was observed[3]. This result shows that the aluminium single crystal used was of good quality, and so the abnormal transmission described here might be observable in such cases. Hence the present experiment was carried out to ascertain whether it is possible to see the Borrmann effect in the aluminium single crystal also.

The crystal specimens were made by the following process: aluminium 99·995 per cent in purity, was cold-rolled into strips, approximately 4 mm. in thickness, and after etching and washing, the strips were annealed preliminarily at 500° C. for 2 hr., and after subjecting to 2 per cent elongation they were heated at 600° C. for 150 hr. to produce the single crystals. In the X-ray examination a copper target was used at 15 kV. and 7 m.amp., a nickel filter about 10μ in thickness was inserted, and the beam aperture was of the order of 5°. The irradiated area of the specimen was about 5 mm. in diameter, and the X-ray source was of the order of 1 mm. in diameter. The specimen was mounted on a goniometer and adjusted so as to obtain a (200) reflexion. The glancing angle of the incident ray was about 75° when set at the Bragg angle. An X-ray film, which was masked with a black paper, was placed so as nearly to touch the back surface of the specimen.

In some cases the Borrmann effect could be observed as shown in Fig. 1, from which it will be seen that the image is formed of two irregular intense lines, which are the images of the transmitted and the diffracted rays, respectively. As the X-ray source is, however, comparatively large, the fine structure of the image is obscure. Fig. 2 is a transmission Laue photograph from the region, either surface of which was ground carefully with emery

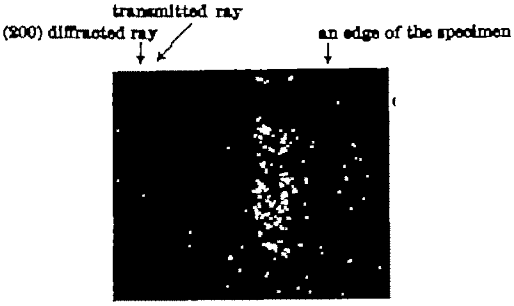

Fig. 1. X-ray image of an aluminium single crystal. (× 10)

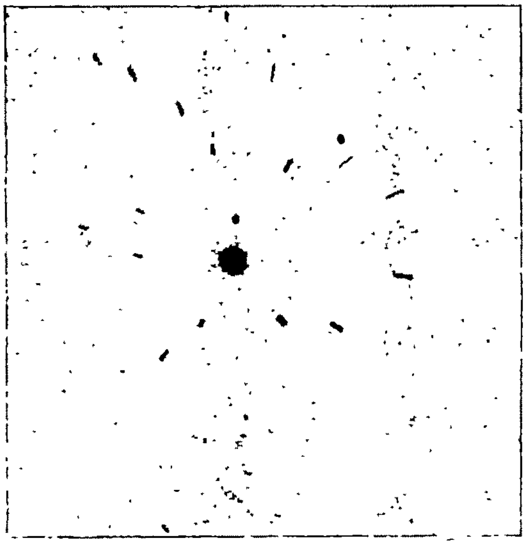

Fig. 2. X-ray photograph of an aluminium single crystal showing double spots

paper. It is clearly seen that each Laue spot is split into two parts. These correspond to an intense reflexion from the thin layer of either surface of the specimen[3]. The observation indicates a large extinction effect. Therefore it may be concluded that the Borrmann effect is also observable in an aluminium crystal of structurally good quality.

We are continuing our studies of the lattice defects of metals by using aluminium single crystals made by zone melting, and are expecting that the internal structure of the crystal will become observable more clearly with such materials of high purity.

CHEMISTRY

The Silicon–Boron System

RECENTLY the synthesis of a compound of the composition SiB_4 has been reported in two articles[1,2]. Concurrent with this work we have been investigating this compound as a part of our programme for studying high-temperature materials.

The compound was prepared in two different ways: (*a*) by sintering in an argon atmosphere a mixture of finely powdered boron (99 per cent purity) with amorphous silicon in an electrical resistance-type furnace; (*b*) by melting a mixture of boron (about 10 per cent) and silicon (about 90 per cent) in a high-frequency induction furnace in an argon atmosphere. The last method usually gives very beautiful crystals of the new silicon boride (SiB_4) embedded in the silicon phase. The excess silicon was dissolved in a nitric acid–fluoric acid mixture.

By the first method of preparing the compound, we were able to study the behaviour of silicon–boron mixtures under various conditions. We have found that at temperatures between 1,200 and 1,380° C., the new compound is formed at first, but is then slowly decomposed into SiB_6 and silicon. At temperatures below 1,200° C. it is stable for long periods. The pure compound, apparently free from SiB_6 and silicon, has been prepared from the stoichiometric mixture heated at 1,200° C. for about three weeks in an argon atmosphere.

Several of our chemical analyses and density measurements indicate the formula SiB_4 (39·3 wt. per cent silicon). Some of our analyses, however, gave higher values of the silicon percentage (up to 48 wt. per cent silicon) and some density measurements also gave considerably higher values (up to 2·55 gm./cm.^{3}) than the one calculated for SiB_4 from our unit cell data: $a = 6{\cdot}319 \pm 0{\cdot}005$ Å. $b = 12{\cdot}713 \pm 0{\cdot}010$ Å. (2·43 gm./cm.^{3}). (Compare the result of Moissan's investigation[3] of apparently the same compound: formula SiB_3, density 2·52.) This suggests a fairly broad homogeneity range, which is also in accordance with the structural arrangements proposed by us. As a further support of this, we have noticed a small variation in relative line intensities from different samples.

From Weissenberg data a two-dimensional Patterson projection along the hexagonal *c*-axis was carried out. The result bears a close resemblance to the corresponding Patterson synthesis for CB_4 (ref. 4), and it would be reasonable to believe that the two compounds are isostructural. However, there are certain discrepancies, and therefore a three-dimensional Patterson synthesis was carried out. It shows that in the 0,0,*z*-position only two atoms are situated, about 2·4 Å. apart. The other atomic positions form icosahedrons in approximately the same manner as in CB_4. The atoms of an icosahedron are of two different sizes, the atoms forming the top and bottom of the icosahedron having higher electron density than the others.

A reasonable way to interpret these facts is the following. Consider the space group $R\bar{3}m$, formula SiB_4 with 9 molecules in the hexagonal cell. 6 of the 9 silicon atoms are placed in a 6*c* position, the other 3 silicon atoms and 15 boron atoms are statistically distributed over an $18h_1$ position ($x \approx 0{\cdot}11$, $z \approx 0{\cdot}87$), and 18 boron atoms are placed in an $18h_2$ position ($x = 1/6$, $z \approx 0{\cdot}02$). The remaining three boron atoms may be placed in interstitial positions or the composition may not be SiB_4. The presumed substitution of boron atoms by silicon atoms in $18h_1$ naturally gives room for a large variation of the composition.

In addition to the work on SiB_4, we have made some preliminary measurements on a part of the liquidus curve of the silicon–boron system. The result is given in Table 1. It is evident that there is a eutectic at about 3 per cent boron.

Table 1. LIQUIDUS TEMPERATURES OF SILICON–BORON MIXTURES

Weight per cent boron	Temperature of final disappearance of the solid phase (° C.)
0	1,420
1	1,415
2	1,406
3	1,403
4	1,411
5	1,414
6	1,420
7	1,422
8	1,431
9	1,421
10	1,431

The work on this liquidus curve and on the structure of SiB_4 will be continued. A three-dimensional Fourier synthesis is being carried out at the moment and the exact parameters will be published later.

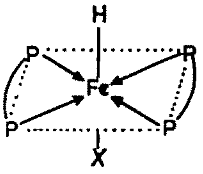
Some New Hydrides of Iron and Osmium

STABLE hydrido-complexes of the type *trans*-[MHX(phosphine)$_2$] (X = halogen or similar anionic ligand, phosphine = tertiary phosphine or chelate di-tertiary phosphine) containing the heavier transition metals ruthenium[1], osmium[1], palladium[2] and platinum[2] have been reported and a very unstable nickel derivative is also known[3]. Here we report the first stable derivatives containing a metal (iron) from the first transition series. These are interesting because the halo-hydrides (II) and (IV) show enormous chemical shifts in the proton resonance spectrum and because the hydride (I) was prepared from the metal and gaseous hydrogen. They have the *trans*-octahedral structure shown below and their properties are summarized in Table 1.

Table 1. PROPERTIES OF THE COMPLEX IRON HYDRIDES

Compound	m.p. (vacuum)	$\nu_{\text{Fe—H}}$	$\delta_{\text{Fe—H}}$ ('Nujol' mulls)	$\nu_{\text{Fe—D}}$	$\delta_{\text{Fe—D}}$	Chemical shift (p.p.m., water standard)
(I)	248–252° dec.	1,726(*s*)	716(*m*)	1,259(*s*)	525(*m*)	+18·4 (C_6H_6)
(II)	154·5–155·5° dec.	1,849(*s*)	—	1,336(*s*)	—	+39·1 (C_6H_6)
(III)	180° dec.	1,810(*s*)	—	—	—	—
(IV)	dec. *c.* 220°	1,870(*s*)	—	—	—	+36·0 (C_6H_6)

Trans-[$FeH_2\{o\text{-}C_6H_4(PEt_2)_2\}_2$] (I) is prepared by dissolving finely divided iron in the diphosphine, $o\text{-}C_6H_4(PEt_2)_2$, at 190° under hydrogen at atmospheric pressure, or by reducing *trans*-[$FeCl_2\{o\text{-}C_6H_4(PEt_2)_2\}_2$] or [$FeCl_2\{o\text{-}C_6H_4(PEt_2)_2\}_2$][$FeCl_4$] with excess lithium aluminium hydride. It is an orange crystalline substance, easily soluble in organic solvents, monomeric in boiling benzene, and thermally remarkably stable but very sensitive to air. The red crystalline hydrido-chlorides (II) and (III) are obtained by lithium aluminium hydride reduction of *trans*-[$FeCl_2$(diphosphine)$_2$], while (IV) is made by the reaction of *trans*-[$FeH_2\{o\text{-}C_6H_4(PEt_2)_2\}_2$] with one equivalent of hydrochloric acid in dry ether.



(I) X = H, P—P = $o\text{-}C_6H_4(PEt_2)_2$
(II) X = Cl, P—P = $C_6H_4(PEt_2)_2$
(III) X = Cl, P—P = $C_6H_4(PMe_2)_2$
(IV) X = Cl, P—P = $o\text{-}C_6H_4(PEt_2)_2$

Trans-[$OsHCl\{C_6H_4(PEt_2)_2\}_2$], which completes the first eutropic series of phosphino-hydrides, has also been prepared, and a comparison of properties is made in Table 2.

Table 2. SOME PROPERTIES OF *trans*-[$MHCl\{C_6H_4(PEt_2)_2\}_2$] ($M$ = Fe, Ru, Os)

M	m.p. (vacuum)	Colour	Dipole moment (±0·2 D)	$\nu_{M\text{—H}}$ ('Nujol' mull)	Chemical shift (p.p.m., water standard)
Fe	154·5–155·5 dec.	red	4·25	1,849	+39·1 (C_6H_6)
Ru	174·5–176	colourless	4·9	1,944	+27·1 ($CHCl_3$) +26·1 (C_6H_6)
Os	170·5–171·5	colourless	4·6	2,051	+31·3 ($CHCl_3$)

It will be noted that $\nu_{M\text{-H}}$ increases by 202 cm.$^{-1}$ on passing from M = iron to M = osmium, corresponding to about 24 per cent increase in bond-strength (force constant) on ascending the series. This is also the sequence of increasing thermal stabilities.

The chemical shift of the proton resonance in compound (II) is the largest ever recorded. It is even greater than the shift of the proton resonance in water relative to the unshielded proton (27 p.p.m.).

We are indebted to Dr. N. Sheppard of the University of Cambridge for the nuclear magnetic resonance spectra, to Dr. D. M. Adams for the infra-red spectra and to Miss L. Bates for the dipole moment determinations.

Gas Liquid Chromatography of Conjugated Fatty Acids

THE heating of polyunsaturated fatty acids in strong alkali is known to cause re-arrangement of the double bonds to form a conjugated system[1]. The effect of this isomerization on the behaviour of polyunsaturated fatty acids in gas liquid chromatography has been studied in relation to linoleic and linolenic acids as found in wheat flour oil.

Oil was extracted by shaking the flour continuously for 2 hr. with carbon tetrachloride under nitrogen. The extract was filtered to remove flour particles and the solvent removed under vacuum in a rotary evaporator. Unconjugated fatty acids were prepared by saponification of the oil under nitrogen with 0·5 N methanolic potassium hydroxide, refluxing for 2 hr. Following acidification and ether extraction, the free fatty acids were methylated by reaction with diazomethane[2].

Conjugated fatty acids were prepared by an adaptation of the alkaline isomerization method[3] for analysis of unsaturated fatty acids. The oil was heated in a solution of 6·6 per cent potassium hydroxide in ethylene glycol at 180° C. for 25 min. under a stream of oxygen-free nitrogen. The mixture was cooled, diluted with water and acidified, when the isomerized free fatty acids were extracted with ether. The fatty acids were methylated as before by reaction with diazomethane.

The mixed methyl esters were analysed with a Pye argon chromatograph using a column packed with 2·3 per cent poly(ethyleneglycol adipate) as stationary phase on 60–100 mesh diatomaceous earth (M. and B. 'Embacel'). The chromatograms of the

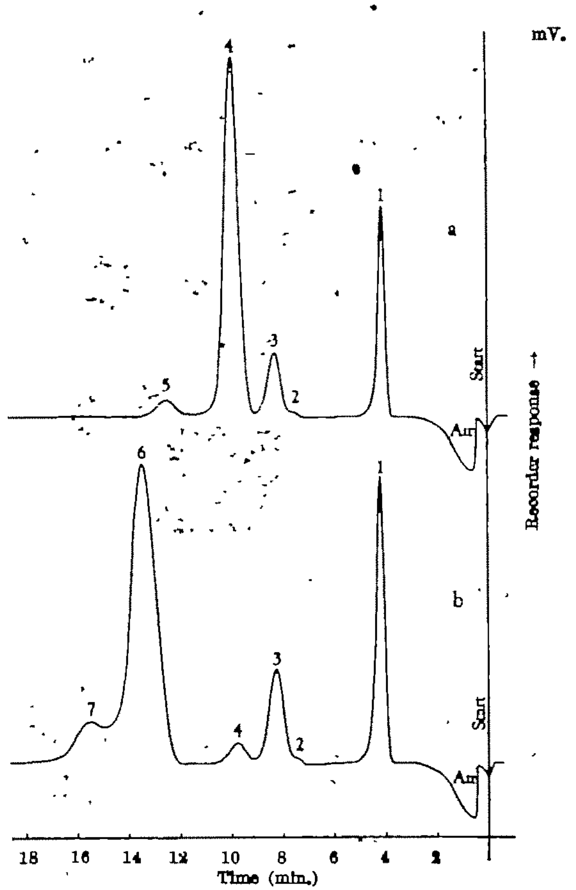

Fig. 1. Gas liquid chromatograms of fatty acid methyl esters from (*a*) unisomerized and (*b*) isomerized wheat flour oil. Column: 120 cm. × 0·4 cm. with argon flow of 20 ml. per min. at 177° C. Peak identification: (1) methyl palmitate; (2) methyl stearate; (3) methyl oleate; (4) methyl linoleate; (5) methyl linolenate; (6) methyl linoleate, conjugated isomer; (7) methyl linolenate, conjugated isomer

methyl esters of the unisomerized and isomerized fatty acids (Figs. 1*a* and *b*) show that following isomerization there is a change in the position occupied by the esters of linoleic and linolenic acids, the conjugated isomers being retained by the stationary phase to a greater extent than the unconjugated acids.

The retention volumes for individual esters, and the percentage composition of the two mixtures are given in Table 1. These results show that isomerization increased the retention of methyl linoleate by 36 per cent, and of methyl linolenate by 24 per cent. The excessive broadening of the conjugated fatty acid ester peaks in Fig. 1*b* may be due to the presence of *cis*- *trans*-isomerism in the conjugated systems. Such isomerism in a conjugated system has been shown by Hoffmann and Keppler[4] to affect the position of 2,4 decadienals in gas liquid chromatography on a silicone-oil column.

Table 1. Gas Liquid Chromatography Analysis of Isomerized and Unisomerized Flour Oil

Fatty acids (as methyl esters)	Retention vol. (ml.)	Relative retention time (oleic = 1·00)	Percentage composition	
			Unisomerized	Isomerized
Palmitic acid	81	0·60	17·5	19·3
Stearic ,,	149	0·91	0·3	0·5
Oleic ,,	163	1·00	11·3	11·6
Linoleic ,,	195	1·20	65·9	2·9
Linolenic ,,	247	1·51	5·0	—
Conjugated linoleic ,,	266	1·63	—	60·1
Conjugated linolenic ,,	306	1·88	—	6·5

The presence of 2·9 per cent of unconjugated methyl linoleate in the isomerized sample indicated incomplete isomerization of the oil by the method[3] used. This was reflected in the low figure of 60·1 per cent for conjugated methyl linoleate as compared with the presence of 65·9 per cent methyl linoleate in the unisomerized sample. However, the total percentage of polyunsaturated acids in the two samples agreed well (unisomerized 70·9 per cent, isomerized 69·5 per cent) and was within the expected error of a single-run determination.

The effect of isomerization on the position of these unsaturated acids when analysed on a column having 5·9 per cent 'Apeizon *L*' grease as stationary phase was also examined. With this type of column the order of elution of saturated and unsaturated fatty acid esters is the reverse of that found using the polar polymer stationary phase mentioned above; that is, increasing unsaturation shortens the retention time of acids having equal carbon chain-lengths.

As previously found[6], the retention time of the polyunsaturated acids was increased after isomerization. The retention time for methyl linoleate increased by 27 per cent, and for methyl linolenate by 58 per cent. This change was particularly striking since before isomerization the unsaturated acids were not separated by this column, whereas after isomerization methyl linoleate was completely separated from methyl oleate, although its position was now coincident with that occupied by methyl stearate.

The marked change in retention time of polyunsaturated acids following isomerization demonstrates the importance of using mild conditions for the saponification of lipids containing such acids during the preparation of the free fatty acid esters for gas liquid chromatography. Thus, inadvertent formation of conjugated acids during the saponification procedure is likely to give rise to anomalous peaks on the chromatograms which will affect both the qualitative and quantitative analyses of the acids present.

In view of this possibility when using the saponification procedure, an alternative method of preparing lipid material for gas liquid chromatography analysis is perhaps to be preferred. Inter-esterification with dry methanol in the presence of an acid, followed by extraction and high-vacuum distillation of the methyl esters formed[5], is one such method, and is now being used exclusively in this laboratory.

We wish to thank Mr. R. J. Davies for technical assistance in this work.

RADIOCHEMISTRY

Radiolysis of Highly Enriched Oxygen-18 Water Solutions containing Hydrogen Peroxide-16,16

The use of the isotope oxygen-18 opens new possibilities to gain information regarding the primary processes in irradiated aqueous solutions. Using ordinary water in the presence of oxygen-16,18, Hart, Gordon and Hutchison[1] were able to obtain information regarding some of the reactions of molecular oxygen. Backhurst, Johnson, Scholes and Weiss[2], using water enriched 1·5 mol. per cent in oxygen-18 at pH 1·2, were able to investigate the incorporation of oxygen-18 into the hydrogen peroxide formed. Recently, highly enriched (92–95 atom per cent oxygen-18) water became available prepared in the Isotope Distillation Plant of the Weizmann Institute and contained practically 100 per cent deuterium), which enables one to investigate the fundamental processes involved, and high concentrations of hydrogen peroxide-16,16 itself may be used to protect the hydrogen peroxide formed by various mechanisms, while serving as a scavenger of radicals at the same time.

We investigated the action of 200-kVp. X-rays and 2·9-MeV. protons on solutions of approximately 1 M hydrogen peroxide-16,16 in water, which contained 92–95 atom per cent oxygen-18.

Reactions were carried out in the presence and absence of initially added oxygen-16,16 or oxygen-18,18 (94 per cent) and in the presence or absence of added 1 M bromide. The reaction products investigated were oxygen-16,16, oxygen-16,18 and oxygen-18,18 formed during radiolysis as well as the same species formed from the decomposition of the hydrogen peroxide after irradiation was completed. Hydrogen peroxide was decomposed by platinum-black, which has been shown (Anbar, M., unpublished work) not to produce during decomposition any induced exchange between the various isotopic species of hydrogen peroxide. Hydrogen peroxide also does not appreciably exchange its oxygen with water. The presence of a high concentration of hydrogen peroxide protects the hydrogen peroxide formed during irradiation, the isotopic composition of which remains intact, and enables its total yield and mode of formation to be investigated.

It was found that in the case of X-rays the yield of hydrogen peroxide-18,18 is relatively unaffected by added bromide ions; the yield is proportional to dose up to total doses of 2 Mrads, the G value being approximately 0·4. On the other hand, in the case of proton irradiation, the yield of hydrogen peroxide-18,18 is reduced by a factor of nearly 10 when bromide is present during irradiation.

The yield of hydrogen peroxide-16,18 in a solution irradiated with X-rays is reduced to half in the presence of bromide, and to one-tenth when proton irradiation is used. For X-rays, the yield of hydrogen peroxide-16,18 remains approximately constant in the pH range 0·3–11. That of hydrogen peroxide-18,18 decreases very significantly above pH 8. These results point to different mechanisms for the formation of hydrogen peroxide-18,18 and hydrogen peroxide-16,18. Tracer experiments using originally added oxygen-18,18 proved that hydrogen peroxide-18,18 does not originate to any large extent from this source. In addition to the radical intermediates H and OH formed from the water by the radiations[3], it is assumed that molecular products, H_2 and H_2O_2, may be produced directly from water[4].

Our results show that hydrogen peroxide-18,18 can indeed be formed through a distinct 'molecular' mechanism from water alone, whereas 'scrambled' hydrogen peroxide-16,18 results from reactions of $H^{18}O$ radicals or their equivalent with hydrogen peroxide-16,16, according to:

$$^{18}OH + H^{16}O - {}^{16}OH \rightarrow H^{18}O - {}^{16}OH + {}^{16}OH$$

Non-destructive Analysis of Microgram Quantities of Silver by Radioactivation

A non-destructive method of determining μgm. quantities of silver by use of the nuclear reactor *JRR*-1 and an *RCL*-256-channel pulse-height analyser has been investigated.

In the present work, a sample (0·1–10 gm.) is placed in the reactor for 30 sec. to be irradiated with neutrons at a flux of 3×10^{11} neutrons per sq.cm./sec., cooled for 10 sec., counted for 20 sec., further cooled for 10 sec., and counted for 20 sec. The scintillator used is a 2-in. thick, well-type sodium iodide crystal. An aluminium vessel (2·5-mm. thick) is inserted in the well as an absorber for β-rays. At the first counting 128 channels in the analyser are used, and in the second counting the rest are used. The resultant γ-spectrum shown on the monitor (Braun tube) is photographed and the height of photopeak due to 0·66 MeV. γ-rays with silver-110 ($T_{1/2}$ = 24·2 sec.) is measured. By the comparative method the amount of silver is determined.

An example of the coefficient of variation of single analyses has been obtained by the use of six standard samples which include 1·25 μgm. of silver each. The coefficient estimated from six values is only 2·8 per cent, the average area under photopeak being $3 \cdot 4 \times 10^3$ counts. Results of analysis are shown in Table 1.

In the case of lead, interference is negligible. In the case of bismuth, slight interference due to *Bremsstrahlung* is found. In the case of zinc sulphide, though two

Table 1. RESULTS OF ANALYSES

Sample	Silver found (p.p.m.)
Lead	1·09
Bismuth I	7·6
Bismuth II	< 0·02
Zinc sulphide (silver added)	23·2

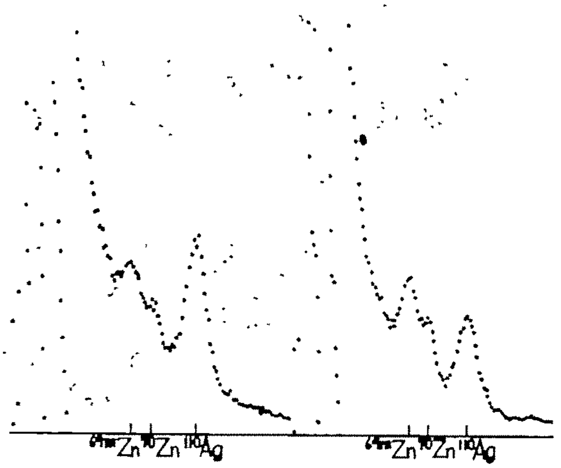

Fig. 1. γ-Spectrum. Sample: 0·35 gm. of silver-added zinc sulphide

photopeaks due to 0·438 MeV. γ-ray with zinc-69 *m* and 0·513 MeV. γ-ray with zinc-71, respectively, are found, the extent of interference is small (Fig. 1). From this the lower limit of the detection of silver in zinc sulphide is estimated at about 1 p.p.m. Further, it can be deduced that, if the matrix of a sample is made of an element which is less activated than zinc under the conditions described above, the detection limit of silver is less than 1 p.p.m. Such elements have been found in the literature on the basis of activation cross-section, half-life of nuclide formed, abundance of unconverted γ-photons of nuclide formed, and of neutron absorption cross-section, and are shown in Table 2.

Table 2. ELEMENTS IN WHICH THE DETECTION LIMIT OF SILVER IS LESS THAN 1 P.P.M.

(Arranged by increasing γ-activity to be induced under conditions in this work)

Radiolytic Oxidation of Ferrous Solutions with Standardized Internal Sources of Phosphorus-32

THE 'Fricke' solution is the most common chemical dosimeter in use at present, but the *G*-value of the oxidation is still not universally accepted. We have redetermined this value by radiolysis with 100–250 mc. phosphorus-32 dissolved in air-saturated 0·8 *N* sulphuric acid containing 10^{-3} *M* ferrous ions (as ferrous ammonium sulphate) and 10^{-3} *M* chloride (as sodium chloride). The energy dissipated by the radioactive decay was determined from standardization of the radioactivity by 4π-proportional counting as well as 4π-liquid scintillation counting, and an acceptance of the calculated value[1] of 0·69 MeV. for the average energy per disintegration of phosphorus-32.

The standardization values as obtained by the 4π-liquid scintillation method are about 1·1 per cent higher than those from 4π-proportional counting. This discrepancy is consistent and quite reproducible[2]. For some years now it has been believed that the proportional counting method was very nearly 100 per cent efficient for high-energy beta emitters such as phosphorus-32[3], but recent work[4] using sodium-24 and phosphorus-32 incorporated in the same compound, $^{24}\mathrm{NaH}_2{}^{32}\mathrm{PO}_4$, in which each radionuclide was separately standardized, the former by β–γ coincidence and the latter by 4π-proportional counting, showed that the self-absorption correction for phosphorus-32 amounted to about 1 per cent. It is thus possible that the newer 4π-liquid scintillation method may be more accurate than 4π-proportional counting.

Carrier-free phosphorus-32, produced by neutron irradiation of sulphur, contains some phosphorus-33. The relative amounts of the two isotopes were determined by measuring the radioactivities of the lines corresponding to mass-charge ratios between 47 and 51 as obtained by the isotope separator of the National Physical Research Laboratory, Pretoria. The phosphorus-33 content was 1·6 ± 0·16 per cent of the total activity.

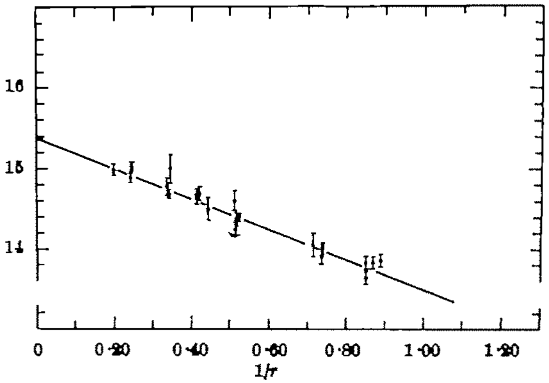

Fig. 1. Variation of apparent *G*-value with radius^{-1}

Corrections for the loss of energy through the walls of the containers were made by measuring the apparent yield, G_r, for each of 22 spherical glass containers of radius *r* and extrapolating the plot of G_r against $1/r$ to zero. Fig. 1 shows the results obtained (standardization by proportional counting). The errors marked are standard errors for each flask, and the straight line is that calculated by the method of least squares, each point being given a statistical weight in accordance with the number of replicate determinations made with the corresponding flask. The same data were used to determine the '95 per cent error' of the *G*-value at infinite radius. The results obtained were:

for 4π-proportional counting	15·39 ± 0·04 ions/100 eV.
for 4π-liquid scintillation counting	15·21 ± 0·04 ions/100 eV.

The assumption of linearity of G_r with $1/r$ is justified by the fact that the discrepancies between values obtained from the straight line and those calculated from data published by Hine and Brownell[1] lie within the experimental errors.

BIOCHEMISTRY

Oxidative Phosphorylation: Synthesis of Adenosine Diphosphate by the Oxidation of Quinol Phosphates

THE importance of oxidative phosphorylation in the respiratory chain of living organisms has led to intensive research into the possible *in vivo* and *in vitro* mechanisms of phosphorylation[1], and several theories have been advanced which postulate quinol phosphates[2-4] (or analogous nitrogenous systems derived from riboflavin[5,6]) as the active intermediates in phosphate transfer.

An earlier communication from this Laboratory[4] reported the formation of inorganic pyrophosphate during the oxidation of 2-methyl naphtha-1 : 4-quinol diphosphate in aqueous solution in the presence of orthophosphate, and this work has now been extended to the synthesis of adenosine diphosphate. Two routes have been successfully followed, in one of which phosphate has been transferred to adenylic acid as substrate, and in the other the nucleotide has been transferred to inorganic phosphate as substrate.

In the first of these two syntheses of adenosine diphosphate, 2 : 3-dimethyl naphtha-1 : 4-quinol monophosphate was oxidized by bromine in the presence of the tetra *n*-butyl ammonium salt of adenosine-5′-phosphate under rigorously anhydrous conditions in N,N-dimethyl formamide. After removal of excess bromine by *cyclo*hexene and evaporation of the solvent, the residue was dissolved in water and passed down a cation-exchange column ('Amberlite *IR*-120', H^+ form). The eluate and washings were freeze-dried, the residual gum dissolved in ethanol, and the nucleotide fraction precipitated with ether[7]. Repetition of this procedure removed ortho- and pyrophosphate. The nucleotide fraction was chromatographed on an anion-exchange column ('Dowex-1', Cl^- form) and the adenosine diphosphate isolated as the free acid (yield estimated spectrophotometrically, 25 per cent). The product had the correct analysis, a phosphorus to nitrogen ratio of 1 : 2·51, and ran as a single spot during paper chromatography and paper electrophoresis. An enzymic estimation (on a sample which had been kept for a week) using phospho-enol pyruvate-pyruvate kinase and myokinase showed the sample to contain 72 per cent adenosine diphosphate and 28 per cent adenylic acid. A parallel assay on the sodium salt of adenosine diphosphate supplied by the Sigma Chemical Co., St. Louis, Missouri, gave values of 87 per cent adenosine diphosphate and 13 per cent adenylic acid.

In the second synthesis, a naphtha-1 : 4 quinol ester of adenylic acid was oxidized in the presence of inorganic phosphate. Adenosine diphosphate was again isolated as the free acid and assayed as before. The results obtained in the two syntheses were virtually identical.

Further details of this work will appear elsewhere. We are indebted to Dr. K. J. M. Andrews (Roche Products, Ltd.) for helpful discussion and the provision of certain materials, and to Dr. J. B. Chappell (Department of Biochemistry, Cambridge) for the enzymic assays.

N-Terminal Amino-Acids of Bovine Antibody

BOVINE γ-globulin has been shown to be a mixture of molecules having N-terminal amino-acids, aspartic acid, glutamic acid, serine, alanine and valine with a total of less than 1 mole/mole of γ-globulin[1]. A partial fractionation was achieved by partition chromatography of γ-globulin; the molecules with N-terminal aspartic acid, serine and alanine were concentrated in the faster running fractions, but valine, the principal N-terminal acid, was present in all the fractions[2]. Glutamic acid was present in only trace amounts in all the fractions.

In view of these results, we suggested that there were two types of γ-globulin: (1) with N-terminal aspartic acid, serine and alanine; (2) with N-terminal valine, and that a partial fractionation of these two types had been obtained. McFadden and Smith[1] analysed γ-globulin from a cow which had been strongly immunized with mixed antigens and found a much higher content of N-terminal valine and only traces of other amino-acids.

This led us to suggest that antibody γ-globulin had only N-terminal valine, and that the molecules with the other N-terminal amino-acids were really β-type globulins which have an electrophoretic mobility similar to that of antibody. We also found that true β-globulin had N-terminal aspartic acid, glutamic acid, serine, alanine, threonine, but no N-terminal valine.

The gift of bovine antibody to a well-characterized antigen (rabbit serum albumin) by Drs. F. J. Dixon and W. O. Weigle enabled us to test our suggestion. The bovine antibody was received as a freeze-dried specific precipitate prepared from the colostrum of an immune cow. It contained 19 per cent of rabbit serum albumin. Rabbit albumin was found to have glutamic acid as N-terminal amino-acid, present in 0·6 mole/mole albumin. The N-terminal amino-acids of the specific precipitate, after allowance for

Table 1. N-TERMINAL AMINO-ACIDS IN BOVINE γ-GLOBULIN

	Amount of N-terminal amino-acid mole/mole protein	
	Commercial preparation	Antibody
Aspartic acid	0·12	0·04
Glutamic acid	0·03	0·00
Serine	0·12	0·10
Alanine	0·11	0·10
Valine	0·42	0·25
Total	0·81	0·49

the N-terminal glutamic acid present in the antigen, are given in Table 1 together with a parallel determination of the N-terminal acids of bovine γ-globulin (Armour Laboratories preparation).

The results for the commercial preparation of bovine γ-globulin agree well with previous results[2] and it can be seen that the N-terminal amino-acid content of the antibody is almost equally complex. Glutamic acid is apparently absent, after allowing for the contribution of the rabbit albumin present in the specific precipitate, but the other four terminal acids are present, all in somewhat lower amounts.

These results do not support the previous suggestion that the complexity of N-terminal amino-acids of bovine γ-globulin arise from contamination with biologically unrelated β-type globulin. The low total yield suggests that in half the molecules the peptide chains are cyclic, or that certain structural features prevent the reaction of the fluor-dinitrobenzene with the terminal amino-group.

We wish to thank Drs. Dixon and Weigle for their generous gift of bovine antibody, and Mr. M. C. Scrutton for his valuable assistance.

Action of Nucleic Acids on the Inhibition of Growth by Actinomycin of *Neurospora crassa*

ACTINOMYCIN is well known to possess cytostatic properties in mammalian tissues[1]. Foley *et al.*[2] have shown the inhibitory effect of actinomycin on the cell-growth of 12 microbiological systems under various experimental conditions. In our work on the mode of action of actinomycin, *Neurospora crassa* was used as test organism.

Recently, Beers[3] has shown the inhibitory effect of dyestuffs on the synthesis of polyadenylic acid in *M. lysodeikticus*. The mechanism of inhibition is supposed to be due to the formation of dye–polymer complexes. Steiner and Beers[4] were able to demonstrate formation of dye–polymer complexes between dyestuff, polynucleotides and yeast ribonucleic acid and deoxyribonucleic acid. An interaction between dyestuff and deoxyribonucleic acid was also shown by Lawley[5]. These findings suggest that actinomycin may act in the same way. It therefore seemed to be of interest to us to study the action of deoxyribonucleic acid, ribonucleic acid and polynucleotides on the growth inhibitory effect of actinomycin on *N. crassa*.

The materials used were: actinomycin *C* from Bayer, Leverkusen; actinomycin *D* from Merck, Sharp and Dohme; deoxyribonucleic acid of low molecular weight from Th. Schuchardt, Munich = deoxyribonucleic acid I; deoxyribonucleic acid of low molecular weight from C. Roth, Karlsruhe = deoxyribonucleic acid II; deoxyribonucleic acid of high molecular weight from C. Roth, Karlsruhe = deoxyribonucleic acid III; ribonucleic acid from C. Roth, Karlsruhe, Th. Schuchardt, Munich, and C. F. Boehringer, Mannheim.

Growth of *N. crassa* was followed in horizontal tubes according to Ryan, Beadle and Tatum[6] (for further details see Rauen[7]). The test-medium was: Fries minimal, pH 6·3; concentration of actinomycin 5 μgm. ~ 0·0025 μmol./ml.; growth inhibition at 96 hr. 90 per cent hydrolysis of deoxyribonucleic acid and ribonucleic acid was performed as described by Schmidt[8].

Table 1. REVERSAL OF INHIBITION OF ACTINOMYCIN BY DEOXYRIBONUCLEIC ACID (DNA), RIBONUCLEIC ACID (RNA) AND SOME OF THEIR DEGRADATION PRODUCTS

Treatment	Substance	Reversal of inhibition (μgm./ml.) 50 per cent	100 per cent
None	DNA I DNA II DNA III	50 30 25	200 80 60
0·1 *N* hydrochloric acid 20° 4 hr. = intermediaries between DNA and apurinic acid	DNA I DNA II DNA III	50 30 25	200 100 60
1 *N* sodium hydroxide 20° 18 hr. = acid insoluble polynucleotides	DNA II	25	60
0·1 *N* hydrochloric acid 37° 27 hr. = apurinic acid	DNA II		no effect
Deoxyribonuclease = 5′-oligonucleotides + 5′-mononucleotides	DNA II	60	200
1·5 *N* hydrochloric acid 100° 1 hr. = purines, pyridine-nucleotide diphosphate, pyrimidine-mononucleotides	DNA I DNA II DNA III		no effect
None	RNA	600	
1 *N* sodium hydroxide 20° 18 hr. = (2)3-mononucleotides	RNA	1,200	
0·1 *N* hydrochloric acid 37° 18 hr. = pyrimidine nucleotides	RNA	1,400	
1·5 *N* hydrochloric acid 100° 1 hr. = purines + pyrimidine + (2)3-mononucleotides	RNA		no effect

As shown in Table 1, deoxyribonucleic acid and ribonucleic acid and some of their degradation products, presumably oligonucleotides, counteract the growth-inhibitory action of actinomycin on *N. crassa*. There are some differences between deoxyribonucleic acid of various origins and of various molecular weights. Obviously ribonucleic acid is far less effective than deoxyribonucleic acid. The degradation products of deoxyribonucleic acid and ribonucleic acid, after alkaline and weak acid hydrolysis, are of about the same activity as deoxyribonucleic acid and ribonucleic acid themselves. Degradation products of nucleic acids of low molecular weights, as are found by extensive hydrolysis, are ineffective. It is, however, of interest to note that commercially available purines and pyrimidines in high concentrations (referring to actinomycin) abolish more or less the cytostatic properties of actinomycin. Adenine, adenosine and adenosine mono-, di- and tri-phosphates at concentrations of 1 μmol./ml. reverse the effect of actinomycin to about 50 per cent, 4–5 μmol./ml. to about 100 per cent. Guanine, xanthine and hypoxanthine could not be tested quantitatively on account of their weak solubility. Guanosine and inosine were as effective as adenosine. At a concentration of 4–5 µmol./ml., certain unphysiological purine derivatives, for example, 8-azaxanthine and 8-chloroxanthine, also counteract the actinomycin effect in this organism to an extent of 50 per cent. The pyrimidines were found to be not very effective. With 10 µmol./ml. of thymine, cytosine and uracil each, only 30 per cent release of actinomycin inhibition was attained. It was further observed, strangely enough, that some unphysiological pyrimidine derivatives, for example, 5-bromuracil and 2-amino-4-methylpyrimidine, which themselves have cytostatic properties, counteract the actinomycin inhibition to a greater or lesser degree.

These experimental results apparently lead to the suggestion that actinomycin reacts directly with deoxyribonucleic acid, oligonucleotides of deoxyribonucleic acid and to a much lesser extent with ribonucleic acid perhaps by formation of dye–polymer complexes. The effect of purines and pyrimidines is supposed to be a kind of displacement of actinomycin from its site of action in the living cell. The high concentrations required of these substances is evidence in favour of this view.

How far this interpretation of experimental results is relevant must be established by further investigation.

Biogenesis of Ascorbigen, 3-Indolylacetonitrile and Indole-3-carboxylic Acid from D,L-Tryptophan-3-^{14}C in *Brassica oleracea* L.

During earlier work we found that ascorbigen (the bound form of ascorbic acid) is an indole derivative[1–4]. In view of the fact that the indole moiety of ascorbigen possesses a carbon skeleton identical with that of tryptophan, the hypothesis was put forward that this amino-acid[5], as well as 3-indolylpyruvic acid[6], may be the precursor of the synthesis *in vivo* of ascorbigen. In preliminary experiments we found that the level of ascorbigen in kohlrabi was raised after the injection of tryptophan into the bulb[7].

Jones and co-workers[8] have advanced the theory that 3-indolylacetonitrile, the plant growth stimulator (auxin) in the genus *Brassica*, may also be synthesized *in vivo* from tryptophan.

In order to verify these hypotheses and preliminary observations, we introduced 5·1 mgm. of labelled D,L-tryptophan-3-^{14}C (specific activity, 25·6 µc./mgm.) to the over-ground parts (50 gm.) of young plants of *Brassica oleracea* L., var. *sabauda* (Savoy cabbage). Tryptophan was administered in the form of a concentrated aqueous solution, which was taken up by the plants in the course of 3 hr. The plants were then transferred to a container with distilled water, where they were left for 48 hr. in light, and at a temperature of 25°. The plant juice (20 ml.) was extracted with 10 ml. of light petroleum, in order to eliminate paraffins and waxes[8], and four times with 10 ml. of ethyl acetate. The ethyl acetate extract was evaporated to dryness *in vacuo* and chromatographed on Whatman No. 1 paper with the butyl acetate/water system[1]. The measurement of the chromatogram on a flow counter with automatic registration showed that the R_F-value of the most active zone corresponded to the R_F-value of ascorbigen (0·5). Another zone of activity was found in the range of R_F-values from 0·7 to 1·0 (Fig. 1).

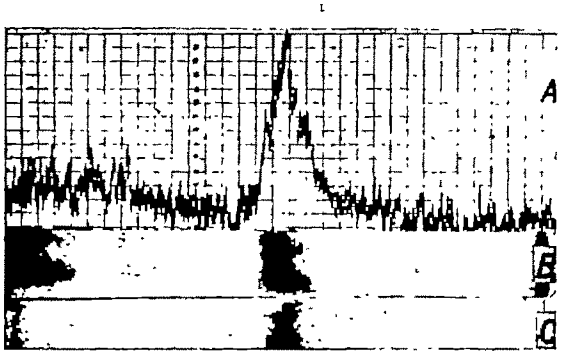

Fig. 1. (*A*) Distribution of the radioactivity on chromatogram *B* as measured with an automatic recording and scanning device (methane flow counter). (*B*) Chromatogram of ethyl acetate extract. (*C*) Chromatogram of a sample of pure ascorbigen

The zone of maximum radioactivity (R_F 0·5) was eluted, and the eluate treated with 1 per cent sodium hydroxide solution. The solution was re-chromatographed in the same solvent system as before. It was found that the eluted active substance behaved in the same way as ascorbigen[9,10], that is, it decomposed into a number of degradation products. The activity in the 0·5 R_F-zone (ascorbigen) disappeared, but reappeared again in the zones of the following R_F-values: 0·9, 0·15 (substance *C*, see refs. 5, 9, 10) and on the starting-line (substance *S*, refs. 10, 12).

The eluate of the zone R_F 0·7–1·0 from the first chromatogram was re-chromatographed in the system carbon tetrachloride/acetic acid/water[8,9,11] and *iso*-propylether/water[11]. Comparison with synthetic specimens showed that the eluate contained radioactive 3-indolylacetonitrile, indole-3-carboxylic acid and a substance corresponding to 3-indolylpyruvic acid. Some other non-identified active products were found in the extract as well.

From these experiments, the conclusion may be drawn that tryptophan can be utilized in the genus *Brassica oleracea* L. for the synthesis of a series of physiologically important indole derivatives, namely: ascorbigen, 3-indolylacetonitrile, indole-3-carboxylic acid and other derivatives.

Our results point to the possibility of a biosynthetic approach to the preparation of labelled ascorbigen that could be of considerable use in the study of its fate and role in plant and animal organisms.

Experimental details will be described in the *Collection of Czechoslovak Chemical Communications*.

Electrophoretic Pattern during Amphibian Development

Paper electrophoresis became a suitable technique for embryological purposes when Kohn[1] proposed the use of pure cellulose acetate as a supporting medium instead of filter paper. This method enables us to separate much smaller amounts of protein than hitherto: one single amphibian embryo yields enough protein to give a clear electrophoretic pattern.

Individual embryos of *Triturus alpestris* of every stage from the uncleaved egg to stage Glässner 26 were sucked up into a capillary tube, frozen, thawed and centrifuged at 7,000*g* for 20 min. The clear supernatant minus the fat layer was applied as a thin line across a cellulose acetate strip (10 cm. × 5 cm.). The same veronal buffer pH 8·6 (0·05 M) was used for the extraction of the proteins and for the electrophoresis itself. A potential gradient of 10 V./cm. was applied for 45–90 min. After the run, the proteins were stained with very dilute (1/10,000) nigrosine in 3 per cent trichloroacetic acid.

The uncleaved egg yields eleven distinct nigrosine-positive bands. Five of them are on the positive side of the pattern and six on the negative side. This distribution is, however, artificial because of the electro-endosmosis which shifts the starting line towards the negative pole. After correction, it is found that only one band migrates towards the negative and nine towards the positive pole. In cleaving eggs, two new fast electropositive bands appear. These fade away at the blastula stage. During gastrulation and neurulation, the electrophoretic pattern is practically the same as in the uncleaved egg. At the tail-bud stage, two of the strongest bands (the third and the fourth from the positive pole) become progressively reduced and finally disappear. At the same place, two very narrow bands make their appearance and remain to the last stage examined (stage 26). These results are summarized in Fig. 1, which shows the fate of the different protein bands during development.

Spiegel[2], using paper electrophoresis followed by staining with bromphenol blue, could detect six cathodic and one or two anodic bands in *Rana pipiens* embryos. All the fractions were detectable from the unfertilized egg to stage 17 and no new band appears during development. The discrepancy with our results may be explained by the superiority of cellulose acetate over filter paper as a supporting medium.

Chemical tests have been made to determine the nature of the proteins separated by electrophoresis. The periodic acid–Schiff reaction of Köiw and Gronwall[3] as modified by Sohar, Bossak and Adlersberg[4] stains red the second, third, fourth and fifth band (Fig. 1, *b*, *c*, *d* and *e*) of the pattern. Furthermore, there is another strong red band on the positive side of the pattern (between *j* and *k*), but this one does not correspond to any protein band. It consists of polysaccharide (very likely glycogen) shifted towards the negative pole by the endosmotic flow. The first, second, third and fourth bands (Fig. 1, *a*, *b*, *c* and *d*) are strongly basophilic: methylene blue stains them dark blue at pH 3.

Attempts are now being made to characterize the chemical nature of all the bands of the embryonic pattern more precisely and to study the distribution of the proteins within different tissues. I wish to thank the Fonds National de la Recherche Scientifique (Belgium) for financial support of this work. I am grateful to Prof. C. H. Waddington for advice and guidance.

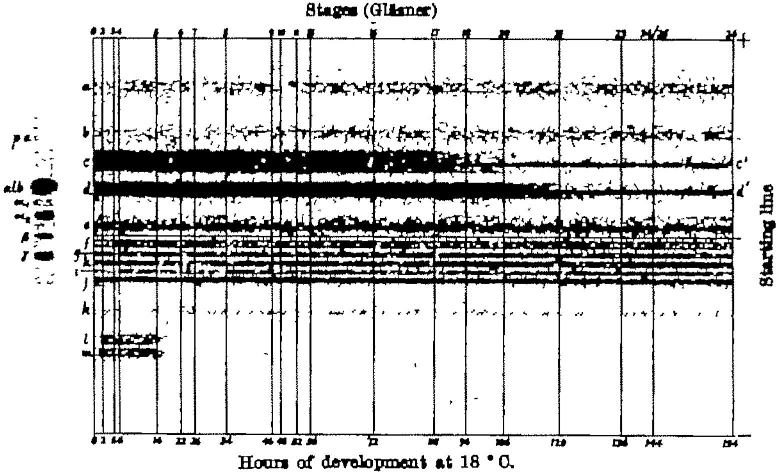

Fig. 1. Electrophoretic changes during embryogenesis. Embryonic proteins subjected to electrophoresis in veronal buffer pH 8·6 for 1 hr. at 10 V./cm. Length between electrodes, 8 cm. The starting line is shifted towards the negative pole by the electro-endosmosis. Real neutral point between *j* and *k*. Control of mouse serum in parallel

PHYSIOLOGY

Electrophysiological Observations on a Sound-producing Fish

SIMULTANEOUS sound and action potential records have been made from a New Zealand marine teleost, *Congiopodus leucopaecilus* (Perciformes), the pigfish, which produces noises in the water by resonance of the swimbladder. The muscles responsible for the sound are a pair of delta-shaped intracostal striated muscles running obliquely between the vertebral intercentra and back border of the pectoral girdle of either side of the body, and lying against the side walls of the swimbladder. In a fish 24 cm. long the swimbladder is 4·5 cm. and the muscles 3 cm.

The records were made on the two beams of a double-beam oscilloscope, the top beam recording the action potentials from a platinum electrode touching the surface of the exposed muscle, and the bottom beam recording the wave form of the sounds in air from a crystal microphone (of the type used in hearing aids) placed against the opposite side of the body. The fish was mounted on a block of wood and perfused through the mouth with aerated seawater.

The records show the expected correlation between the moment of muscle contraction and the onset of the sound produced. They were obtained without artificial electrical stimulation of any kind, and from behaviour observations and tape recordings of the fish in aquarium tanks can be taken as representing the normal pattern of sound production in this fish. Each sound may be thought of as a single drum beat, and they occur singly or at intervals of more than a second, or as a train of beats at rates of 4–10 per sec. when their function probably includes that of threat. These repetitive sounds are accompanied by raising of the dorsal fin armed with stout spines, and dissection reveals that the occipitospinal nerve supplying the drumming muscle also has fibres running dorsally to the spine-raising trunk musculature.

The muscle spike is of extremely short duration and consists of a number of summed muscle action potentials. Fig. 1 shows the recruitment of fibres during the first 6 beats in a train; the synchrony of firing of the different motor units is such that the total duration of the summed spike is increased by less than 25 per cent of the initial one.

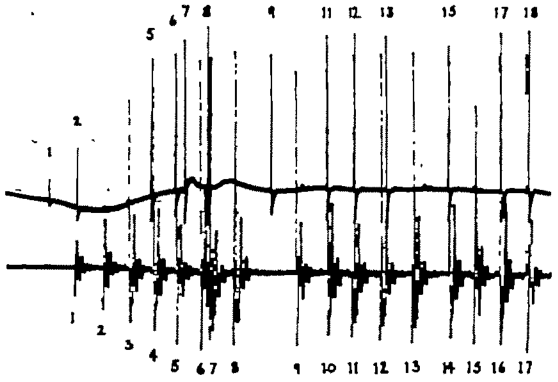

Fig. 1. Muscle action potentials (top trace) and sound vibrations (lower trace) recorded by moving-film camera during the start of a train of sounds at an average of 8/sec. The two beams were staggered in position: the first sound corresponds to the first muscle spike, etc.

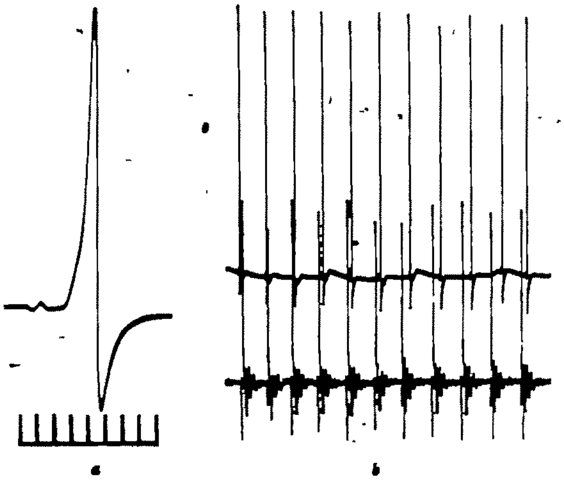

Fig. 2. *a*, Typical summed muscle action potential preceded by the incoming nerve volley (scale in msec.): *b*, record similar to Fig. 1 (but with altered gains) made during a prolonged burst of drumming

The electrical events associated with each contraction (Fig. 2*a*) last 9 msec. The initial deflexion in Fig. 2*a* is the incoming motor nerve volley recorded in volume. The muscle spike, arising after a neuromuscular delay of 1·4 msec., has the following characteristics: rising phase, 2·1 msec.; rapid downward phase, 0·5 msec., and relatively slow (6 msec.) return to resting level from the positive side of the base-line. The end-plate potential appears as a shallow slope (1·1 msec.) at the beginning of the rising phase. Recorded summed spike values are of the order of 6 mV.

There is synchrony of contraction between the drumming muscles of either side. Occasionally during recording one of the two muscles would fail to contract; when this occurred with the exposed muscle, the action potential of the other could still be seen on the recording side and the sound was still maintained (in Fig. 1, the third, fourth, tenth, fourteenth and sixteenth drum-beats are of this kind); in these instances the sound vibrations showed a less-complicated and more-consistent wave-form than when the muscles of both sides contracted. Analysis of the wave-form of the sounds indicates that a 25-cm. fish produces a frequency of about 200 cycles per sec.

It has thus been possible to investigate an overt piece of fish behaviour at a basic physiological level, and it is to be hoped that further features of the behaviour on one hand and its nervous basis on the other will be studied in this preparation. The intracostal muscles of *Congiopodus* and the pattern of impulses they receive from the central nervous system are highly specialized for sound production. The rapidity and constancy of the twitch contraction ensure the production of a specific sound of fairly regular wave-form, though the constancy and loudness of the signal must be limited by the restricted properties of the swimbladder as a resonator. Within these limitations it would seem, both from the steady maximum recruitment-level recorded (Fig. 2*b*) and the fact that the observed rate of drumming is many times slower than the refractory period of the muscle, that the system achieves a near optimal and consistent signal relatively free from interference by a preceding drum-beat. In each of the drum-beats illustrated, except the sixth in Fig. 1, the vibrations of the swimbladder recorded in air have almost completely disappeared from the lower trace before the onset of the next beat. Interference is clearly seen in the seventh drum-beat.

Finally, the cerebellum is notably much larger proportionately in *Congiopodus* than in *Trigla*—a related fish the sounds of which are restricted to the breeding season—and in the absence of information about the role of fish sounds in orientation and communication it is worth speculating that the cerebellum is being used in the integration of the drumming response possibly in relation to reception of its own sounds or those of other members of the school.

This work was done while at the Portobello Marine Biological Station, supported by the Nuffield Foundation. I am indebted to Dr. G. H. Satchell for assistance with the recording, which was carried out in the Department of Physiology, University of Otago Medical School, New Zealand.

Immunoelectrophoretic Studies on Purified Human Growth Hormone

THE antigenicity of purified preparations of human growth hormone have been demonstrated by means of a modified tanned cell hæmagglutination method[1], precipitin ring tests[1,2], gel-diffusion studies[2,3] and by immunoelectrophoresis[4].

In immunoelectrophoresis the growth hormone appears as a β-globulin and evidence has been presented for its purity by this technique[4].

In the following experiment, five rabbits (*A–E*) were immunized with 2 mgm. human growth hormone purified according to the technique of Li and Papkoff[5] and mixed with Freund's adjuvant[6]. The injections were given once a week for three weeks, each rabbit obtaining 2 mgm. subcutaneously each time, and one month later 1 mgm. of growth hormone without adjuvant intravenously. One week later the animals were bled and the sera tested in hæmagglutination experiments and immunoelectrophoresis. The hæmagglutination titres of these sera were 1 : 30,000–1 : 80,000.

The immune sera were tested in immunoelectrophoresis against the purified growth hormone preparation in a concentration of 1 mgm./ml. and against undiluted human serum from an evidently normal blood donor.

All immune sera gave a single precipitate in the slow α-globulin region against the growth hormone preparation. This precipitate presented an extended slightly asymmetric shape against four of the immune sera, and when immune serum *D* was used to develop the pattern a two-peaked symmetrical precipitate was obtained (Fig. 1).

The shape of the precipitate is among other factors depending on the relative distribution of serologically identical molecule populations in the electrophoretic field, and a two-peaked symmetrical precipitate is obtained if two electrophoretically different although serologically identical molecule populations are mixed in the same amounts and subjected to immunoelectrophoresis provided the difference in electrophoretic position between those molecule populations is not too pronounced[7].

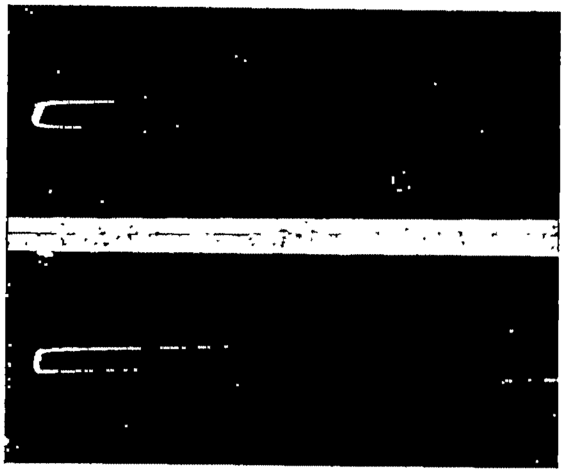

Fig. 1. Immunoelectrophoretic pattern of purified growth hormone (upper beam) and a normal serum (lower basin) as revealed by anti-growth hormone immune serum *C* (upper plate) and *D* (lower plate). To the far left the albumin precipitate is seen in the lower basins

Against one of the immune sera (immune serum *B*) a further precipitate was obtained in the fast α-globulin region.

In conclusion the purified growth hormone preparation appeared immunologically homogeneous when tested against four immune sera prepared on different rabbits. The fifth immune serum (*B*) revealed evidence of another serologically and electrophoretically different component. The single precipitate presumed to represent the growth hormone precipitate was found to be asymmetrical or two-peaked, indicating that it consists of two electrophoretically different although serologically identical molecule populations.

All immune sera against the purified growth hormone preparation also reacted with albumin and γ-globulin in an evidently normal serum. Some of the immune sera also reacted with other components as, for example, the α_1-glykoprotein (*TBP*)[8] and 1–2 α_2-globulins. The γ-globulin precipitate in all instances appeared more extended than when developed with a homologous immune serum.

In the normal serum, no precipitate was found which agreed with the presumed growth hormone precipitate as regards electrophoretic position, site between diffusion centres or shape of the precipitate.

An anti-human immune serum did not give any precipitate formation against the growth hormone preparation, although giving at least 18 different precipitates with a normal human serum (Fig. 2). It might therefore be suspected that impurities mainly of albumin and γ-globulin are present in the purified growth hormone preparation in amounts

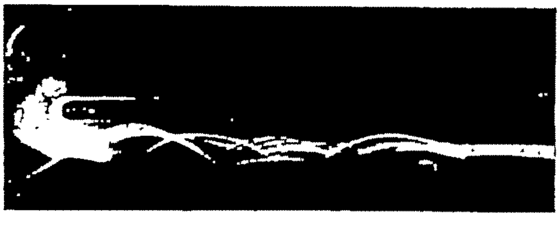

Fig. 2. Immunoelectrophoretic pattern of same material as in Fig. 1 developed with an antihuman immune serum. (Upper basin: purified growth hormone 1 mgm./ml.; lower basin, a normal serum.) No precipitates are seen in the upper basin

sufficient to elicit antibody formation although not sufficient to give precipitate formation in the present experimental circumstances. As another possibility, the antibodies against the growth hormone itself might be suspected of also reacting with certain normal serum constituents. Absorption of one immune serum against the growth hormone preparation with a normal human serum by means of intra-basin gel-absorption[9] did not, however, absorb the antibodies against the growth hormone preparation.

Increase of Esterase Activity during Intracellular Digestion in a Histophagous Ciliate

THE macrophages of vertebrates and invertebrates[1] as well as some Protozoa[2] exhibit strong esterase and lipase activity demonstrable by histochemical and biochemical methods. Considering the prominent position of the hydrolytic enzymes in digestive processes, it seems probable that they have also some significance in the intracellular breakdown of particles, a common characteristic of both cell-types in question. In the course of our recent work on the problems of feeding and digestion in a histophagous ciliate, *Tetrahymena corlissi* Thompson, strain *W*, we obtained some results that may confirm this assumption.

Cells of *T. corlissi*, grown axenically on a tryptone (1 per cent) and yeast extract (0·05 per cent) broth, were washed twice in Prescott solution and kept during the experiments in the same solution. Fresh frozen sections of rat spleen served as food. The animals readily ingested the spleen cells. Smears of unfed and fed (for 1 hr.) animals, and those of animals starved (2–24 hr.) in Prescott solution after feeding, were fixed in cold 10 per cent formalin (1 hr.). The 'Tween' procedure of Gomori[3] and the azo-dye procedure of Nachlas and Seligman[4] were used for the demonstration of esterases. The slides were mounted in glycerine-jelly.

Unfed animals exhibited a slight or moderate activity on the substrates α-naphthyl acetate, 'Tween 60' and '80'. Parallel with the formation of food vacuoles a great increase in esterase activity has been observed. Using α-naphthyl acetate, which gives a distinctly localized reaction product, the food vacuoles could be demonstrated as the site of the increased activity (Fig. 1). The 'Tween' procedure revealed only a general increase in the activity, but did not show its intracellular localization. In animals starved after feeding there is a drop in the activity to the initial level within 24 hr. The digestion is already completed at this time and the animals contain only empty vacuoles as revealed by the control slides stained with hæmatoxylin.

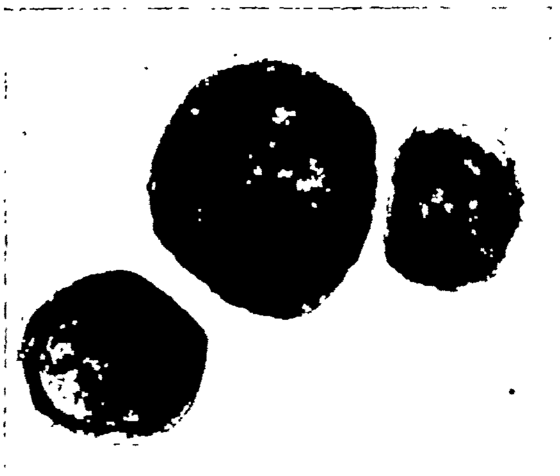

Fig. 1. One fed and two unfed cells of *T. corlissi*. The food vacuoles of the fed individual exhibit a strong esterase activity. Azo-dye method

These changes are probably due to an activation of the enzymes and may indicate an intimate correlation of the esterases with the intracellular digestion. Our recent findings do not enable us to determine the type of the enzymes responsible for the increase observed. The splitting of both substrates, α-naphthyl acetate and the unsaturated 'Tween 80', seems to indicate that at least a non-specific esterase and a lipase may be at work. Further studies aiming at a more detailed characterization of the enzymes are in progress.

We wish to thank Dr. J. O. Corliss for the strain of *T. corlissi* and the Difco Co., Ltd., for supplying us with a sample of tryptone and yeast extract.

A High-Energy Phosphate Requirement for Succinate Oxidation in Uncoupled Rat Liver Mitochondria

IT has been reported by Borst and Slater[1,2] that rat liver mitochondria, depleted of endogenous phosphate by pre-incubation with hexokinase and glucose, showed a marked phosphate requirement for the oxidation of glutamate in the presence of 2,4-dinitrophenol. This phosphate requirement was attributed to the substrate-level phosphorylation linked to the oxidation of α-ketoglutarate which is not uncoupled by dinitrophenol. Evidence has been given that other Krebs-cycle metabolites, such as succinate, citrate, and malate, did not show the same phosphate requirement in uncoupled systems as that observed with glutamate and α-ketoglutarate. Recent work in this Laboratory[2] has shown that when mitochondria were pretreated for 2 min. at 30° C. with 10^{-4} *M* dinitrophenol or with 10^{-4} *M* dinitrophenol + 10^{-3} *M* adenosine-5′-phosphate, in both cases in 0·25 *M* sucrose, and afterwards washed twice with sucrose, other Krebs-cycle metabolites showed a phosphate requirement very similar to that observed by Borst and Slater in the case of glutamate and α-ketoglutarate. In such systems succinate was the only Krebs-cycle substrate the aerobic oxidation of which proceeded without any apparent phosphate requirement when the respiration was measured using the conventional Warburg technique.

However, a more detailed analysis of the succinate oxidation in mitochondria pretreated with dinitrophenol, performed by measuring the initial phase of oxygen uptake with the oxygen electrode, has shown that the requirement for phosphate in this system is even more striking than that observed with other Krebs-cycle metabolites. Moreover, succinate not only required inorganic phosphate for maximum oxidation but also the inorganic phosphate had to be added to the mitochondria together with the succinate, prior to the addition of the uncoupler, since inorganic phosphate added after the addition of dinitrophenol or of dicoumarol was no longer able to stimulate succinate oxidation. Evidence for this effect is demonstrated in Fig. 1 by showing the different rates of succinate oxidation in mitochondria pretreated with dinitrophenol according to the different order of addition of succinate, inorganic phosphate and dicoumarol. The above effect suggested that the presence of both inorganic phosphate and succinate, prior to the addition of the uncoupler, was needed for synthesizing high-energy phosphate. It therefore seemed that the dinitrophenol pretreatment had brought the mitochondria into a condition where high-energy phosphate was required for oxidizing succinate at maximum rate.

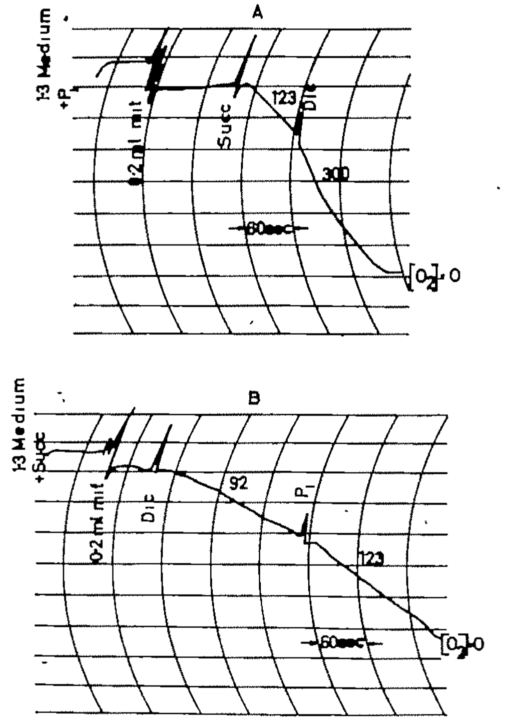

Fig. 1. Inorganic phosphate requirement for oxidation of succinate in 2,4-dinitrophenol-pretreated rat liver mitochondria. The inorganic phosphate is able to stimulate respiration only if added before the uncoupler (*A*), and not if added after the uncoupler (*B*). Concentrations of the reagents in a final volume of 1·5 ml. were as follows: 0·05 *M* potassium chloride, 0·033 *M* *tris* buffer, pH 7·5, 0·008 *M* magnesium chloride, 0·05 *M* sucrose, 0·013 *M* succinate (*Succ*), 0·003 *M* inorganic phosphate (*Pi*), 0·00006 *M* dicoumarol (*Dic*). Mitochondria from 400 mgm. rat liver wet weight (about 8 mgm. protein). The substances were added at the points indicated. '1·3 Medium' stands for potassium chloride, *tris* and magnesium chloride, added in a volume of 1·3 ml. Oxidation-rate of succinate is given in mμ atoms oxygen per min.

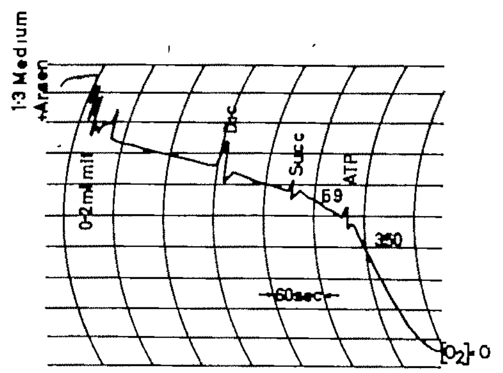

Fig. 2. Stimulation of succinate oxidation by adenosine triphosphate in an arsenate–dicoumarol-inhibited system. Concentrations of reagents were as given in Fig. 1. 0·002 *M* arsenate (*Arsen*) and 0·0013 *M* adenosine triphosphate (*ATP*) were added at the points indicated. Oxidation-rate of succinate is given in mμ atoms oxygen per min.

The validity of this hypothesis was tested with rat liver mitochondria depleted of phosphate by preincubation in the presence of arsenate and dicoumarol, since it has been observed[3] that incubation with arsenate is the most efficient means tried to deplete the mitochondria of both inorganic and high-energy endogenous phosphate. As shown in Fig. 2, the addition of succinate to normal rat liver mitochondria pre-incubated for 3 min. in the presence of 2 m*M* arsenate and 6×10^{-5} *M* dicoumarol resulted in a very low respiration. The addition of 1·m*M* adenosine triphosphate to this inhibited system was able to stimulate the respiration 4–6-fold, bringing the oxidation rate of succinate to about 50–60 per cent of the level obtainable by the addition of dicoumarol to rat liver mitochondria in the presence of succinate.

The possible interference of oxaloacetate as inhibitor of the succinate oxidation in our system, although very improbable because of the fact that succinate was added last to the arsenate–dicoumarol-inhibited system, was ruled out by the addition of cysteine-sulphinic acid, which was not able to stimulate the inhibited respiration although it was able to remove oxaloacetate by way of a transaminase reaction[4]. Moreover, the oxidation of succinate with phenazine metosulphate as electron acceptor was not inhibited in this system.

Another aspect of the inhibition of the succinate oxidation, described above, was obtained by testing the effect of amytal. As shown in Fig. 3, addition of 2 m*M* amytal to mitochondria prior to, or simultaneously with, the addition of arsenate and dicoumarol resulted in a complete prevention of the respiratory inhibition. This effect of amytal was probably due to bringing the mitochondrial diphosphopyridine nucleotide into the reduced state (by way of endogenous mitochondrial substrates)

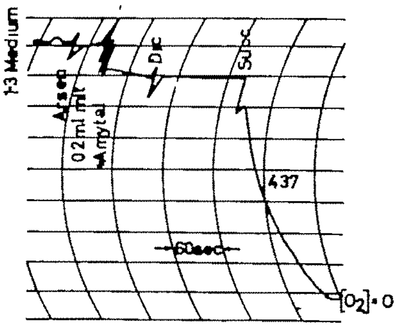

Fig. 3. Protection by amytal of succinate oxidation in an arsenate–dicoumarol-inhibited system. Concentrations of reagents as given in Figs. 1 and 2. 0·002 *M* amytal was added, together with the mitochondria at the point indicated. Oxidation-rate of succinate given in mμ atoms oxygen per min.

since it failed to occur when the amytal was added after the arsenate and dicoumarol, or when it was tested in mitochondria pretreated with dinitrophenol plus adenosine-5′-phosphate; addition of glutamate and inorganic phosphate to the latter system restored the amytal effect.

The results presented here strongly indicate that the oxidation of succinate in phosphate-depleted, uncoupled mitochondria is influenced by the redox status of one or more carriers in the amytal-sensitive region of the respiratory chain. The conditions required for succinate oxidation may be fulfilled either by an extensive reduction of the mitochondrial diphosphopyridine nucleotide or by the addition of high-energy phosphate, the latter possibly acting by a 'reversal of the oxidative phosphorylation'. This hypothesis is in line with the observations reported from different laboratories[5,6] that the oxidation of succinate in intact mitochondria is accompanied by a high degree of reduction of diphosphopyridine nucleotide, even higher than that observed with substrates linked with diphosphopyridine nucleotide. The interest of the present findings may lie in the fact that adenosine triphosphate apparently can influence the respiratory chain in spite of the presence of phosphorylation-uncouplers, or in other words, that dinitrophenol (and other uncouplers) apparently only inhibit the forward, but not the backward, reaction of respiratory chain phosphorylation. This concept is in agreement with the postulated mechanisms of phosphate–adenosine triphosphate exchange and dinitrophenol-induced adenosine triphosphatase reactions previously formulated at this Institute[7].

This work has been aided by a grant from the Swedish Medical Research Council.

Total and l(+) Tartaric Acid Inhibited Rat Serum Acid Phosphatase

THE activity of the total acid phosphatase has been determined in many of the rat's tissues, but data on the activity of this enzyme in rat serum are scant[1,2]. We did not find any report dealing with l(+) tartaric acid inhibited acid phosphatase in rat serum.

The purpose of the present investigation was to determine the activities of the total and l(+) tartaric acid inhibited acid phosphatase in the serum of rats of both sexes. The results of our work are shown in Table 1. It is evident that the activity of both serum total and l(+) tartaric acid inhibited acid phosphatase is much higher in the rat than in the human serum in which the mean activity is 2·5 King–Armstrong units in adults and 5 King–Armstrong units in children[3]. Although the mean activity of the serum total acid phosphatase in small rats is slightly higher than the mean activity in bigger rats of the same sex, and the mean activity in big male rats higher than in big female rats, the differences are statistically not significant.

Table 1. SERUM TOTAL AND l(+) TARTARIC ACID INHIBITED ACID PHOSPHATASE IN RATS

Group No.	Sex	Weight (gm.)	No. of rats	Serum total acid phosphatase in King–Armstrong units; mean ± *S.D.*	Serum l(+) tartaric acid inhibited acid phosphatase in King–Armstrong units; mean ± *S.D.*
I	Male	40–50	12	18·5 ± 2·98	6·79 ± 2·3
II	Male	140–180	19	17·2 ± 4 92	8·86 ± 3·4
III	Female	40–50	8	17·3 ± 2·1	7 3 ± 2·93
IV	Female	120–160	10	14 9 ± 3·17	6·7 ± 1 26

White rats were anæsthetized with 'Nembutal'. Blood was drawn from the abdominal aorta, twice centrifuged and the enzyme activities determined immediately thereafter according to the methods of King (ref. 5) and Fishman (ref. 6).

The proportion of the l(+) tartaric acid inhibited to the non-inhibited serum acid phosphatase ranges from 1 : 2 to 1 : 1, a higher proportion than that found in humans. The mean activity of the l(+) tartaric acid inhibited phosphatase in the serum of big male rats is higher than in the serum of female rats of the same age and weight-range ($P < 0·05$; *t* test). This may be due to prostatic activity.

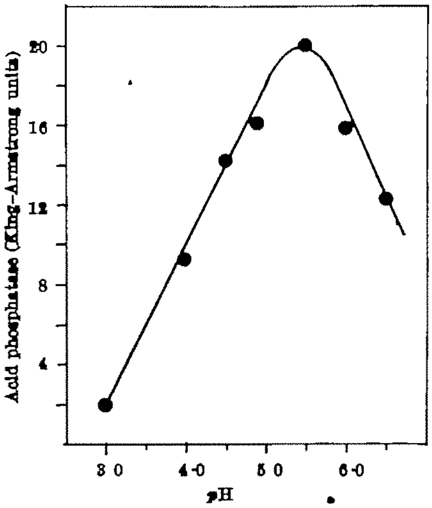

Fig. 1. pH enzyme activity curve for total serum acid phosphatase (citrate buffer)

The pH optimum of total acid phosphatase was found to be pH 5·5 (Fig. 1). Dialysis against citrate buffer pH 4·9 at 4° C. for 24 hr. did not change the activity.

It is not clear which tissues contribute to the high activity of the total and $l(+)$ tartaric acid inhibited acid phosphatase in the rat serum. The optimum pH of 5·5 points to the red cells as a possible source of the uninhibited acid phosphatase[4]. (The pH optimum of the inhibited enzyme could not be detected over the range of pH 3–6.) The high activity of the $l(+)$ tartaric acid inhibited enzyme in female rats shows that there exist major sources for it other than the prostate.

From this work it seems that younger rats do not have statistically higher serum acid phosphatase activity than older ones such as in humans[5], but without serial determinations at many ages starting in very young animals this question cannot be definitely answered.

Rat serum with a high activity of total and $l(+)$ tartaric acid inhibited acid phosphatase presents a valuable tool for the study of the properties of the above enzyme.

This investigation was supported by grants from the General Federation of Labour in Israel and the Upjohn Co.

Physiological Media for Tissues of *Helix*

During the course of recent work in this School, it became necessary to find a physiological saline suitable for the tissues of *Helix aspersa* Müller. The saline was required for a series of experiments on oxygen-uptake by certain tissues of *Helix*, using the Warburg method.

Two solutions suggested themselves for consideration: that of Bernard and Bonnet[1] and that of Hédon–Fleig[2]. The former solution contains the chlorides of sodium, potassium, calcium and magnesium; no buffer is required and no sugar is provided. It was devised for experiments on the heart of *Helix pomatia*, and is capable of supporting heart-beat for periods of up to four days. A factor in favour of this solution is the ease with which it can be prepared. The Hédon–Fleig solution is more complex: it contains a phosphate buffer, is provided with a sugar, and requires adjustment to a pH of 8·4. Moreover, it requires special measures for sterilization, since the use of heat causes liberation of carbon dioxide and a consequent rise in alkalinity.

The Bernard and Bonnet solution was used in the first of the series of experiments referred to above. The tissues investigated were: (*a*) slices of liver and ovotestis (no effort made to separate the two tissues) —two flasks; (*b*) slices of the common duct of the reproductive tract—two flasks. All the flasks registered a rapid and progressive decline in oxygen-uptake commencing within 30 min. of the start of the experiment (that is, from the first manometer reading) (Fig. 1). In all cases oxygen consumption ceased within 1 hr.

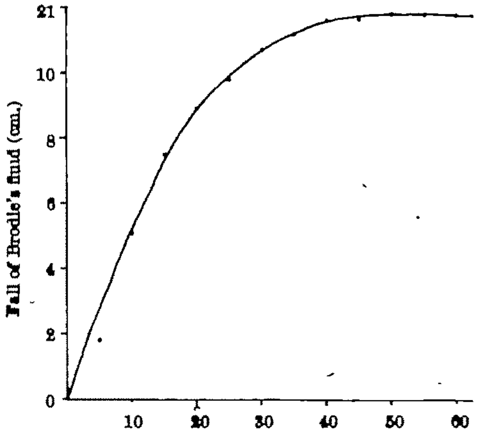

Fig. 1. Oxygen uptake, measured as a fall of the Brodie's fluid in the manometer, plotted against time. Slices of liver and ovotestis in Bernard and Bonnet saline

In the second and subsequent experiments Hédon–Fleig saline was used. Tissue slices were taken from: (*a*) liver and ovotestis; (*b*) common duct; (*c*) albumen gland; (*d*) penis; (*e*) gonad (no liver tissue attached); (*f*) crop with salivary glands attached. Several 'runs' were performed with tissues (*a*), (*b*) and (*c*). In contrast with the earlier results, the rates of oxygen-uptake usually remained constant throughout the experiments, which lasted from 1¼ to 1¾ hr. (Fig. 2). This observation indicates that the saline was not at fault in the few cases where the rate of oxygen uptake tended to decline. Moreover, when a decline occurred it was invariably small, and in no case did oxygen-consumption cease within the period of the experiment.

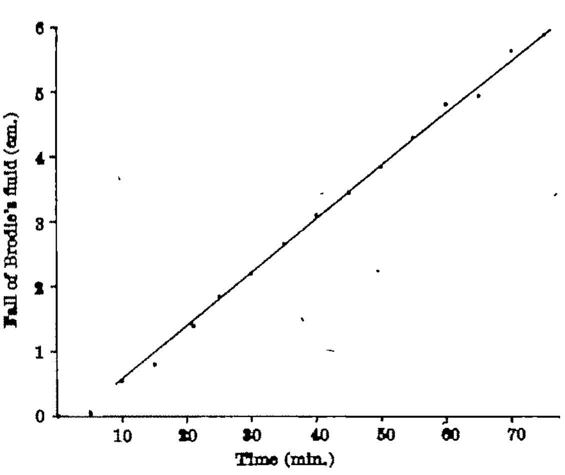

Fig. 2. Oxygen uptake, measured as a fall of the Brodie's fluid in the manometer, plotted against time. Slices of liver and ovotestis in Hédon–Fleig saline

Although the first experiment (Bernard and Bonnet saline) was not repeated, the results are regarded as reliable. It is concluded that, whatever the merits of the Bernard and Bonnet saline where the snail heart is concerned, for most tissues of *Helix* the Hédon–Fleig solution is a more suitable physiological medium.

It is of interest to note that Prosser[3] gives a formula for a physiological solution for *Helix* and attributes the formula to Bernard and Bonnet[1]. However, the formula given by Prosser bears no resemblance to that of Bernard and Bonnet. Moreover, it yields a considerable amount of precipitate which persists at all temperatures from about 20° C. to boiling point. Prosser's formula was therefore regarded as an error and was not used in these experiments.

'Water Rigour' as an Aid when Operating on Marine Gastropoda

WHILE investigating the physiological aspects of the distribution of two species of the marine gastropod *Bullia*, one of us (A. C. B.) discovered that these snails can crawl only between certain limits of salinity. As the salinity of the sea-water is decreased by the addition of distilled water, movements become more and more restricted, eventually resulting in the total loss of locomotory powers while the animal becomes distended due to the osmotic inflow of water. Providing that dilution is accomplished reasonably slowly (taking 60 min. or more) the foot is not retracted at any stage, while the excitability of the muscles is greatly reduced or disappears completely. The animal remains motionless with stiff, swollen tissues. For *Bullia digitalis* Meuschen, this critical salinity lies in the region of 1·8 per cent, while in the case of *B. laevissima* (Gmelin) it is about 2·35 per cent. Loss of locomotory powers due to decreased salinity has previously been noted for some rocky-shore gastropods by Broekhuysen[1] and Brown[2]. The phenomenon resembles the loss of contractility in vertebrate skeletal muscle subjected to 'water rigour'. However, in *Bullia* the process is completely reversible. The snails can be kept for some hours at these reduced salinities without apparent ill-effect; when returned to fresh, undiluted sea-water they soon recover and behave normally.

A fuller account of this work is soon to be published.

It is well known that most operations for experimental purposes on Gastropoda are extremely difficult, because of the powerful contractions of the animal's muscles. Anaesthetics, to which the snails are rather insensitive, do not prevent contractions satisfactorily, even if the animals are so heavily drugged that they do not recover. In connexion with research on the function of the osphradium in *Bullia*, we were interested in severing the osphradial nerve of the living snail. At first we were at a loss for a successful method of performing such a delicate operation, but then it occurred to us that animals subjected to 'water rigour' might prove to be suitable subjects. A number of snails were therefore brought into this condition. As expected, the snails could then be operated on without any difficulties arising from muscular contractions. A window was cut in the shell, over the osphradium and dorsal pallial artery, and the osphradial nerve was then severed with a small eye-surgeon's scalpel. When returned to undiluted sea-water, more than half the snails operated on recovered and were used for experiments on sensory perception. None of these showed any abnormal behaviour[2] which could be attributed to previous 'water rigour'.

Those snails which did not recover were later dissected in order to discover the cause of death. In all of them it was found that structures other than the osphradial nerve had been injured during the operation; in most cases the pallium had been damaged. In no snail was there any evidence that the reduced salinity conditions to which they had been subjected had produced ill-effects.

Other work in our Department (unpublished experiments by G. Noble) has confirmed that 'water rigour' is a very effective aid when operating on *Bullia*, not only for the operation described above but also in removal or cauterization of organs possibly connected with sensory perception, such as the inhalant siphon, tentacles, etc. It seems likely that the 'water rigour' technique might find wider application in the field of gastropod physiology.

IMMUNOLOGY

Natural Occurrence of Delayed-type Iso-hypersensitiveness

EVIDENCE has been obtained for the existence, in certain normal guinea pigs, of a state of delayed iso-hypersensitiveness to a heritable factor present in the serum of other normal guinea pigs. This condition, which arises at about 2 months of age, appears analogous to the long known[1] natural existence of circulating iso-antibodies to heritable blood group antigens in other species. Delayed-type hypersensitivity to isophile antigens may, of course, be experimentally induced (*cf.* ref. 2), but its spontaneous occurrence seems not to have been suspected.

The occurrence of delayed skin reactions among guinea pigs inoculated for the first time with the sera of others is illustrated by a typical experiment. The sera of 12 adult albino guinea pigs (bred from Rockefeller Institute stock) were injected separately into the skin of the back of each of the animals; thus, every animal received 0·1 ml. of 1 : 3 dilution in saline of its own as well as of the 11 other sera. As shown in Table 1, certain of the guinea pigs (Nos. 1–3) responded to the sera of most of the other animals, though not to their own, with erythematous skin

Table 1. DELAYED SKIN REACTIONS GIVEN BY CERTAIN NORMAL GUINEA PIGS TO THE SERA OF OTHER NORMAL GUINEA PIGS

Test of serum from guinea pig No.:	Reaction of guinea pig No.: 1	2	3	4	5–12
1, 2, 3	0	0	0	0	0
4	±	0	0	0	0
5, 6, 7	+	+	+	0	0
8, 9	+	+	±	0	0
10	+	±	+	0	0
11, 12	+	±	±	0	0

0, ±, + = erythema 0–4, 5–9, 10–14 mm. in diameter, at 18–24 hr.

Table 2. INHERITANCE OF THE SERUM FACTOR(S) IN GUINEA PIGS ELICITING DELAYED SKIN REACTIONS IN OTHER NORMAL GUINEA PIGS

No. of pairs	Parental pairs: Serum factor* ♀	× ♂	Live offspring: Serum factor* +	−	Foetal death-rate†
15	+	+	79	1	0·9
8	+	−	14	19	2·1
8	−	+	23	18	2·4
12	−	−	0	85	2·8

* Determined by skin tests in which 0·1 ml. of undiluted serum, from animals at least 2 months old, was injected intradermally into each of 2–4 animals known to be dermally reactive. Sera were judged positive if they evoked reactions of at least 10 mm. in diameter.

† Stillborn and neonatal deaths per 10 live births.

reactions that first were noticeable in 8–10 hr., were maximal at 18–24 hr., and lasted several days. The remaining 9 animals showed insignificant reactions; instead, each (except No. 4) possessed serum capable of evoking a definite response in one or more of the first group.

Comparable experiments, in which guinea pigs of Rockland Farms stock were tested with each others' undiluted sera, likewise differentiated (*a*) dermally reactive animals the sera of which did not evoke skin reactions, (*b*) dermally non-reactive animals possessing sera capable of evoking reactions in others, and (*c*) individuals with neither positive attribute. On the other hand, no dermal reactor was found in a limited test (18 animals) of a third guinea pig stock.

What is doubtless the generalized counterpart of the local skin reaction has been observed in non-immunized animals corresponding to Nos. 1–3 of Table 1. Such animals displayed delayed erythema of the skin of the entire body following intravenous inoculation of 3–4 ml. of a pooled serum which had, one day earlier, elicited local delayed skin reactions in them. The characteristics of these local and general reactions clearly set them apart from the immediate-type cutaneous reactions, related to permeability substances[3], seen in virtually all guinea pigs inoculated with unselected homologous sera.

The factor in serum that evokes the delayed skin response is inactivated by boiling, but not by heating the serum at 56° C. for 30 min. It migrates electrophoretically with the β-globulins[4]. When present, serum factor is detectable from birth and appears to increase as the animal matures. That it is inherited is evident from mating experiments (Table 2). Thus, when present in both parents, serum factor (*SF*) appeared in 79 of 80 live offspring; when present in one parent, about half the offspring possessed it; and when absent in both parents, it was not detected in the young (85 live animals examined). In matings in which the male possessed and the female lacked serum factor and, hence, could not transmit it preformed to her young, serum factor was found in 23 of 41 offspring. The inheritance mechanism is under investigation, as is the question of whether parental (possibly maternal) lack of serum factor is associated with increased foetal mortality, as suggested by the data in Table 2.

The delayed reactivity of certain guinea pigs to the serum of others is not in response to an inherently toxic substance, as originally believed[5], but rests on an immunological basis. Passive transfer of the reactive capacity has been achieved by transplanting lymphoid cells from dermally reactive animals to adult recipients pretreated by neonatal injection of small numbers of donor leucocytes[6], or by total-body X-irradiation. For reasons not yet clear, efforts to transfer dermal reactivity to normal animals have failed.

Table 3 illustrates the results of a set of transfer experiments in which individual donors were either dermally reactive (exp. *A–D*) or non-reactive (*E*, *F*). To assess the reactivity of donor and recipient animals a single pool of 3 individual guinea pig sera positive for serum factor was used, with a pool of 3 sera lacking serum factor as control. Preparations prior to each transfer were as follows. After determining the dermal reactivity of the donor animal, washed leucocytes from 2 ml. of its blood were injected intravenously into each of several guinea pigs (less than 24 hr. old) born of parents lacking both serum factor and dermal reactivity. (About 75 per cent of such offspring would also lack both attributes.) When about two months of age, the presumed chimeras of each particular donor were skin-tested, along with the donor. On the following day, one of the young—provided it was found to lack dermal reactivity to serum factor—was injected with the donor's washed spleen and lymph node cells (the equivalent of 0·15 ml. and 0·10 ml. packed cells) intraperitoneally as well as intravenously. When available, a second recipient was given the donor's serum (2–3 ml. daily for 3 days) by the same routes. Tests for dermal reactivity were made on the third day following transfer and on two or three further occasions during the intervals shown in Table 3.

Dermal reactivity was conferred upon normally non-reactive animals by the lymphoid cells of reactive donors (exp. *A–D*) in a time sequence typical of passive transfer of delayed-type hypersensitivity[7,8]. The transferred reactivity appears specific for serum factor as no recipient reacted significantly to the pool of sera lacking serum factor. In control experiments *E–F*, lymphoid cells from two non-reactive donors failed to confer reactivity upon comparably pretreated recipients.

Table 3. CELLULAR TRANSFER OF DELAYED SKIN REACTIVITY FROM NATURALLY REACTIVE TO NON-REACTIVE GUINEA PIGS (PRECONDITIONED BY DONOR LEUCOCYTES)

Animal skin tested	Time of skin test, pre- or post-transfer	Reactions to sera containing or lacking serum factor*

Recipient of serum	1 day pre-	0	0					0	0	0	0		
	3–22 days post-	0	0					±	±	0	0		

* Reactions to intradermal inoculations of 0·1 ml. of undiluted pooled sera containing serum factor (*SF*+) or lacking it (*SF*−). 0, ±, +, +±, ++ = erythema 0–4, 5–9, 10–14, 15–19, 20–24 mm. in diameter at 18–24 hr.

The grouping of guinea pigs on the basis of presence or absence of heritable serum factor appears fundamentally similar to the differentiations made within other species based on the occurrence of heritable substances in the sera of some but not all individuals. That is, guinea pig serum factor may be likened to the haptoglobins, transferrins, caeruloplasmins, etc., visualized by starch-gel electrophoresis in the sera of cattle and man[9], or to the gamma-globulin allotypes of rabbits[10]. Indeed, serum factor appears most closely analogous to the Lewis antigens of man[11] and the *J* substance of cattle[12], since natural iso-antibodies (though of circulating type) occur against these substances. Work is in progress to determine whether guinea pig serum factor may be associated with circulating iso-antibodies, may be visualized electrophoretically, or has a discernible biological function. The existence in the guinea pig of what is evidently a new type of 'iso-immune' state, namely, delayed iso-hypersensitivity, suggests the possibility that a similar state may occur in other species, especially those cited above, and may have escaped detection perhaps because of low frequency.

I am grateful to Dr. Edward J. Hehre for guidance, for help with this manuscript, and for the term 'iso-hypersensitivity'. Thanks also are due Miss Janet F. Parks and Miss Rita Hixon for technical assistance.

The work was supported by grants *E*-1264 and *E*-2003 from the National Institutes of Allergy and Infectious Diseases, U.S. Public Health Service.

PATHOLOGY

Bone Marrow Depression in Murine Leukæmia

On occasions the appearance of leukæmia in humans is preceded by a period of bone marrow depression and evidence of aplastic anæmia[1]. Such findings may persist for some time and may result in confusion in diagnosis or the leukæmia is regarded as an aleukæmic form of the disease. In a group of *A* strain mice at present being studied for the effects of intermittent X-radiation, it was noted that while, as expected, the mice developed lymphocytic neoplasms and leukæmia in response to the irradiation, a significant proportion of animals with these diseases also showed aplastic or hypoplastic changes in their marrows when examined at autopsy. This hypoplasia initially affected the erythropoietic cells (Fig. 1), but as it became more severe appeared to affect all elements of the bone marrow (Fig. 2). The incidence of lymphoid leukæmia and the various forms of that disease in this group of mice have been considered elsewhere[2]; this communication presents some of the features of the marrow depression which is seen in the mice with lymphoma and lymphoid leukæmia. Table 1 shows the distribution of marrow hypoplasia or aplasia in the different groups of mice. A fuller discussion of the incidence of this condition, its time of appearance and relationship to radiation dose will be presented elsewhere. However, it is obvious that two factors, apart from radiation, appear to increase the incidence of bone marrow depression; they are femaleness and the absence of a thymic tumour or enlargement.

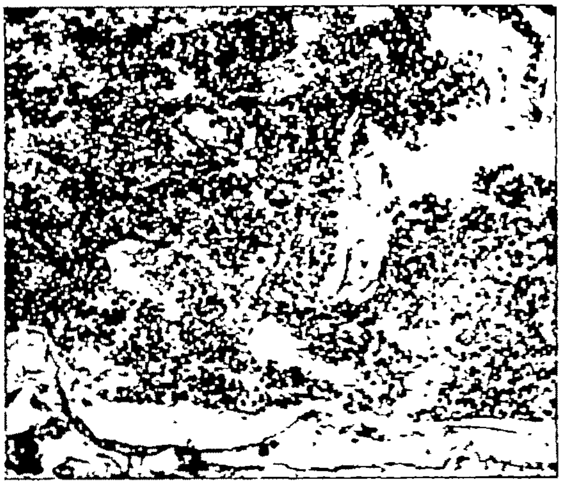

Fig. 1. Hypoplastic bone marrow from vertebra. Diminution mainly in erythropoietic cells. Female mouse with non-thymic lymphoid leukæmia. Received 1,000 r. total body intermittent X-radiation. Age, 335 days at death. Hæmatoxylin and eosin. (× 200)

It is known that a number of endocrine secretions, for example, adrenal steroids, sex hormones, may influence lymphoid tumour production in the mouse and, in general, hormones which appear to diminish the size of the thymus appear to inhibit the genesis of

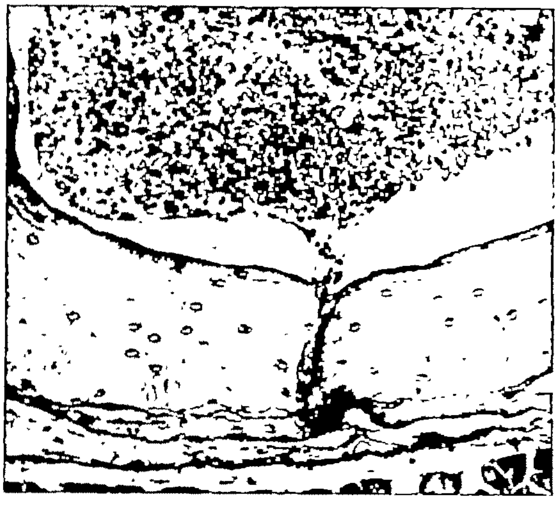

Fig. 2. Aplastic bone marrow—right mid-femur. Female mouse with non-thymic lymphoid leukæmia. Received 1,000 r. total body intermittent X-radiation. Age, 318 days at death. Hæmatoxylin and eosin. (× 200)

TABLE 1

	Radiated mice Male	Radiated mice Female	Control mice Male	Control mice Female
a Total numbers of experimental mice				
With leukæmia	108	121	20	17
Without leukæmia	495	455	89	102
b Animals with bone marrow depression in relation to total numbers				
With leukæmia	24 (22·2%)	44 (36·3%)	1 (5·0%)	2 (11·7%)
Without leukæmia	59 (11·9%)	60 (13·1%)	2 (2·2%)	6 (5·8%)
c Total numbers of animals with different forms of leukæmia				
Thymic	73	62	2	2
Non-thymic	35	59	18	15
d Animals with bone marrow depression in relation to different forms of leukæmia				
Thymic	7 (9·5%)	16 (25·8%)	0 (0%)	1 (50%)
Non-thymic	17 (48·5%)	28 (47·5%)	1 (5·5%)	2 (15·5%)

Leukæmia here signifies a generalized neoplastic disease, with or without thymic enlargement, in which the tumour cells are almost all immature lymphocytes. Radiation was given as 100 r. weekly total body X-radiation to totals of 500 r., 1,000 r. and 1,500 r.

lymphoma[3]. The influence of œstrogen is a little obscure, and appears to depend on the time of administration of the hormone in relation to radiation[4]. Recently, Metcalf[5] has claimed that the thymus secretes a hormone-like substance, lymphocytosis-stimulating factor, the levels of which are raised in mice with a high incidence of spontaneous leukæmia and in mice following radiation. Throughout the life of mice unaffected by infectious disease, the commonest circulating leucocyte is the lymphocyte, and it must be assumed that such cells probably bear the brunt of the immunological defences in that species. Consequently, interference with the mechanisms of control of lymphocyte production and function probably have serious consequences for the mouse. We know that œstrogens may cause marrow aplasia in dogs and in spayed rats—abnormalities which may be corrected by testosterone[6]. We also know that testosterone may produce a rise in red-cell numbers in women who have carcinoma of the breast and who are treated with this hormone[7], and recently testosterone has been used in the treatment of aplastic anæmia in children with success[8].

The present findings indicate further the complexity of the pathogenesis of lymphoid leukæmia in the mouse. At least two hormone systems, the sex hormones and, if it can be shown to be a distinct hormone, lymphocytosis-stimulating factor, appear to be directly implicated. While it is not permissible to transfer directly findings in the mouse to humans, it would seem reasonable to try testosterone administration in those patients with aplastic crises in leukæmia and also in those patients who present with aplastic or hypoplastic bone marrow pictures. Some of these latter may ultimately develop frank leukæmia, and attempts at marrow regeneration may allow earlier recognition of the disease.

VIROLOGY

Isolation of a Non-pathogenic Tumour-destroying Virus from Mouse Ascites

ANOMALIES of growth of an ascites tumour, consisting of aggregation of tumour cells and other changes, first reported in 1957[1], led to the belief that the tumour was reverting to a solid habit of growth, and selective transplantation was undertaken with the object of segregating solid and fluid variants. As this investigation proceeded, the aggregation effect showed signs of evolving into a more advanced pathological state, with increasing indications of destruction of tumour cells. Many sublines were lost as the incidence of no-takes after massive counted implants increased. Many such no-take animals survived for long periods with no signs of illness or delayed tumour development.

Evidence was obtained that the phenomenon is due to an antigenic tumour-destroying agent, and after excluding a bacterial causation, a virus-like agent was looked for. Vaccinia was thought to be implicated but this was not confirmed, though it seems likely that it was in some way associated with the development of destructive effect on tumours[2].

Early attempts to transmit infectivity by means of filtrates were unsuccessful, probably on account of high losses on filtration; but samples from one 'abnormal tumour' subline which had been stored at −50° C. provided a bacteriologically sterile filtrate that had a potent destructive effect on the Krebs 2 ascites and the Ehrlich ascites tumours obtained from the Chester Beatty Institute and maintained in isolation. Preliminary results show that the sarcoma 37, the Landschutz, the *BP*/8, and the Crocker ascites tumours are also destroyed.

That the agent multiplies is shown by its recovery after serial transmission five times in sterile filtrates obtained from washed Ehrlich cells after infection *in vivo*. The filtrates have been prepared from centrifuged supernatants of infected, washed Ehrlich cells, homogenized in distilled water and filtered through sintered glass of porosity 5. For the transmission of infectivity *in vivo*, the starting filtrate was found to have unchanged potency up to a dilution of 1 : 100, with all-or-none tumour destruction occurring at higher dilutions. At 1 : 1,000, about 30 per cent of the tumours were destroyed, the remaining 70 per cent growing normally to a full yield. The potency of the final, 5th-passage filtrate was qualitatively unchanged, though it had undergone a dilution of the order of $1 : 5 \times 10^6$ during five serial transfers. Control filtrates from 'normal', isolated tumours (Ehrlich and Krebs), prepared in the same way, have never given rise to destruction of tumours or even modified the final yield of tumour cells as compared with untreated and saline controls.

Destruction of tumour cells begins after a latent period following infection. Transmissible infectivity has been extracted from washed cells throughout the latent period. Undiluted filtrates destroy the tumour cells after 3–5 days, but unfiltered extracts are more potent (titre of 10^{-7}), the first signs of cell damage occurring 15–20 hr. after infection. The Ehrlich and Krebs tumours are destroyed when treated with the virus at any stage of ascites growth. Destruction is quantitative in many cases when the agent is given shortly after the implantation of several million tumour cells. In many instances the ascites tumour is effectively destroyed, but a solid tumour develops later at the site of implantation. The earliest result of infection is the sudden aggregation of tumour cells and the deposition of fibrin from the exudate which coagulates in the peritoneal cavity. Increasingly marked nuclear abnormalities leading to total nuclear disruption are seen during the ensuing three days.

The destruction of an established tumour results in the production of a substantial quantity of intraperitoneal debris, and adhesions are formed that give rise to intestinal obstruction, producing various degrees of illness. When a tumour implant is totally destroyed as a result of early treatment with the virus, little or no intraperitoneal disturbance occurs and the animals are indistinguishable from controls not bearing tumours.

A small group of normal mice without tumours, which received 10^6 times the tumour-destroying dose of a filtrate, have been observed for two months and have shown no sign of illness.

Infected cells taken during the phase of cell destruction have been examined under the electron microscope by Dr. R. Dourmashkin, through the courtesy of Dr. R. J. C. Harris, at the Imperial Cancer Research Fund Laboratories at Mill Hill. Large numbers of uniform particles, 75 mμ in diameter, have been found in the cytoplasm. Work is in progress to correlate the presence of these particles with the cytopathogenic effect. The appearance and other known properties of the agent suggest that it may be a new virus.

I thank Prof. Wilson Smith for his encouragement and advice during the latter part of this work.

An Interferon-like Substance released from Tick-borne Encephalitis Virus-infected Chick Embryo Fibroblast Cells

AN interference phenomenon between tick-borne encephalitis and Western equine encephalomyelitis viruses in chick embryo fibroblast monolayers has been described[1]. When chick embryo tissue cultures are inoculated with tick-borne encephalitis virus, the virus multiplies readily, but no cytopathic effect appears until the sixth or seventh day of cultivation. If cultures thus infected had been superinfected with a convenient dose of Western equine encephalomyelitis virus, which normally completely destroys the cells within 48–72 hr., the following events could be observed: (1) complete degeneration of cells caused by this virus and, hence, no interference if tick-borne encephalitis virus-infected cultures were challenged with Western equine encephalomyelitis immediately or 24 hr. after primary inoculation; (2) partial interference if cultures were challenged 48 hr. after inoculating them with tick-borne encephalitis virus; (3) complete suppression of the cytopathic effect caused by Western equine encephalomyelitis virus if challenged 72 hr. after primary inoculation. No interference was established if interfering virus previously neutralized by immune serum was added to cultures.

If, however, the culture fluid infected with tick-borne encephalitis was harvested and transferred to fresh non-infected chick embryo fibroblast monolayers, from which the original fluid had been removed, and immediately challenged with Western equine encephalomyelitis virus, no cytopathic effect caused by Western equine encephalomyelitis virus was present at the time of reading. Treatment of the transferred medium by immune γ-globulin against tick-borne encephalitis virus did not alter its ability to inhibit the cytopathic effect of Western equine encephalomyelitis virus. This phenomenon resembled interferon production in other cell-virus systems, first described by Isaacs and Lindenmann[2]. Results of some experiments analysing this observation are presented.

20 per cent mouse brain suspension of the *Hypr* strain (Czechoslovak tick-borne encephalitis) and the prototype strain of Western equine encephalomyelitis virus propagated in a chick embryo fibroblast bottle-culture were used throughout all experiments. Trypsinized chick embryo cells[3] were cultivated in a medium consisting of 5 per cent inactivated horse serum and 0·5 per cent lactalbumin hydrolysate in Hanks's solution with antibiotics and phenol red. Tube-cultures were seeded with 0·9 ml. of cell suspension containing 3 × 10^5 cells, 1,000-ml. Roux bottle-cultures with 3 × 10^7 cells in 50 ml. of medium. One-day old tube cultures were inoculated with 0·1 ml. of tick-borne encephalitis virus suspension diluted to contain 10^4 *LD*50, bottle-cultures with 0·5 ml. of virus suspension containing 10^3 *LD*50/0·1 ml. The culture fluid was harvested at various intervals, as given with the results. For testing the inhibiting activity of the media harvested, 1–3-day old tube-cultures were used. The Western equine encephalomyelitis virus used as challenge was diluted to contain 10^2–10^3 *TCD*50/0·1 ml. Results were read 3 days after adding the Western equine encephalomyelitis virus. Absence of cytopathic effect caused by Western equine encephalomyelitis virus was considered as positive inhibition.

Table 1 demonstrates the time of appearance of the inhibiting agent in tick-borne encephalitis virus-infected cultures.

For testing the ability of the agent to inhibit the plaque formation of Western equine encephalomyelitis virus a procedure adopted in this Institute for the screening of virus-inhibiting substances (Rada and

Závada, personal communication) was used. After adsorption of Western equine encephalomyelitis virus diluted to contain about 5×10^{2} plaque-forming units in 1·9 ml., chick embryo cell monolayers in 10-cm. Petri dishes were overlayed with agar into which small glass cylinders were placed. Two drops of the medium harvested from tick-borne encephalitis virus-infected cultures 72 hr. after inoculation and then treated with immune γ-globulin were placed in each cylinder, using the same dilutions as in the previous experiment. Otherwise the technique described by Dulbecco[3] was employed. Small but definite zones of plaque inhibition could be noticed around cylinders into which undiluted fluids were dropped (Fig. 1). A similar effect was noticed by Porterfield when testing interferon against a variety of plaque-producing viruses[4].

5	,, ,,	Inhibiting agent left to adsorb 24 hr. at 37° C., then removed and WEE added	1 · 80
6	,, ,,	Inhibiting agent mixed with WEE, incubated 1 hr. at 37° C., then transferred into cultures	1 . 80

* Highest dilution to which complete inhibition of the cytopathic effect was established with fluids transferred undiluted and twofold diluted from 1 : 5 to 1 : 160.

† Contained $10^{4\cdot 3}$ i.c. mouse *LD*50 of tick-borne encephalitis virus.

‡ Contained $10^{3\cdot 3}$ i.c. mouse *LD*50 of tick-borne encephalitis virus.

Some work on the mode of action of the agent is summarized in Table 2.

The same dilutions of the fluid which were effective in cultures, mixed with the same dilution of Western equine encephalomyelitis virus and immediately inoculated intracerebrally into mice, did not prevent death caused by Western equine encephalomyelitis virus; all the mice died within the normal incubation period of this virus (72 hr.).

Further evidence has shown that the virus-inhibiting agent released from tick-borne encephalitis virus-infected cells differs from the virus. The agent is adsorbed by cells in culture and seems to have no direct action on extracellular virus. It does not prevent death caused by Western equine encephalomyelitis virus in mice if tested by the same way as in cultures.

Mode of Action of Micrococcal Phosphodiesterase

IT was recently reported that phosphodiesterase isolated from *Micrococcus pyogenes* var. *aureus* hydrolyses tobacco mosaic virus nucleic acid giving rise to di- and mono-nucleotides[1,2]. On the basis of its action on this acid and synthetic polymers, polycytidylic acid and polyuridylic acid, it was postulated that the enzyme first cleaves the large nucleic acid molecule into several polynucleotides, which are further broken down by stepwise cleavage of mononucleoside 3′-phosphates starting from one end, until they are reduced to the size of dinucleotides, which are resistant to further action of the enzyme. Thus the enzyme appears to have both endo- and exo-actions. From the amounts of dinucleotides present in the final digest of tobacco mosaic virus nucleic acid, one can calculate the number of intramolecular breaks that are produced in the acid by the endo-action of the enzyme, by assuming that the dinucleotides are at one end of the resultant polynucleotide fragment. In these calculations the data used for the purine and pyrimidine composition of tobacco mosaic virus nucleic acid are those published earlier[3], and the molecular weight of nucleic acid was taken as 2×10^{6} (ref. 4). From the calculations it appears that tobacco mosaic virus nucleic acid has been degraded to approximately 1,240 polynucleotide fragments, having an average weight of 1,600 or an average length of approximately 5 nucleotides.

However, the results presented earlier[3] do not show whether the polynucleotide fragments that are first formed as a result of the endo-action of the enzyme are further degraded starting from the 5′-hydroxyl end of the chain or from the 3′-phosphate end. Experimental evidence has now been obtained on this point, and as will be described, it appears that the enzyme degrades polynucleotide fragments from the 3′-phosphate end.

The polypurine nucleotide fragments, terminated by pyrimidine nucleotides used as substrate in the present work, were prepared as follows: 26·8 mgm.

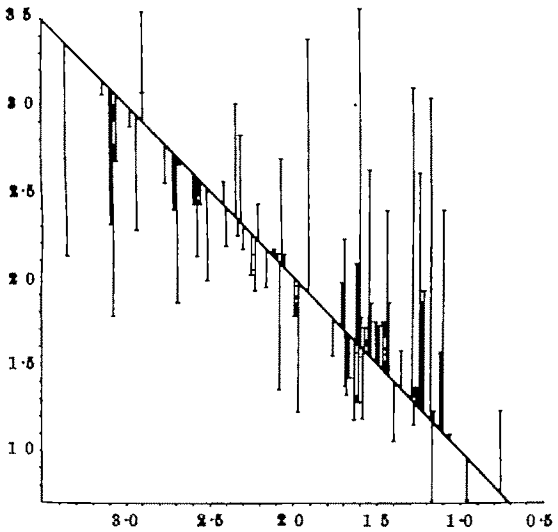

Fig. 1. Oxygen consumption in rats during irradiation

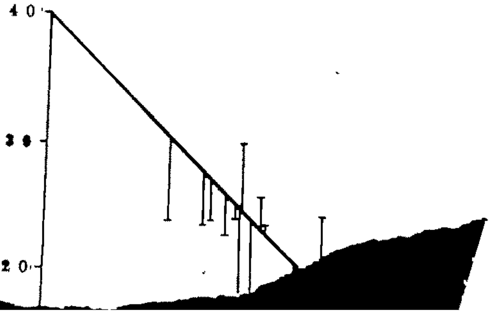
100 male rats (Wistar strain), average weight 190 gm., were divided into four experimental and one control groups, of 20 rats each. The rats were placed in the test chamber and the initial value of oxygen consumption in every rat was measured for 10 min., then the rats were put back in their cage. After a period of 45 min. the second estimation of oxygen consumption was made, and the rats were exposed to X-rays (180 kV., 15 m.amp., 1 mm. aluminium, 0 5 mm. copper, focal distance changed according to the dose-rate. Dose-rates were 100, 50, 20 and 10 r./min. Dose 1,000, 500, 200 and 100 r.).

The oxygen consumption of irradiated and control rats was measured individually by methods described in a previous paper[1].

I did not find any differences in average oxygen consumption in experimental groups during irradiation depending on the dose-rate; but I found that differences depend on the individual level of oxygen consumption before irradiation.

A comparison of oxygen consumption of experimental and control animals in dependence on the initial level of oxygen consumption is given in Figs. 1 and 2.



All experimental animals could be divided in three groups according to the value of initial consumption before irradiation: in the first group are animals with average values, in the second group are animals with extremely high values and in the third animals with an extremely low initial level of oxygen consumption. In the first group rats with an increased oxygen consumption and with a decreased oxygen consumption were observed, the average value of changes being at their initial level. In the second group, the rats have decreased their oxygen consumption and the average values of these changes are lower than their initial level. In the third group, the oxygen consumption is increased during irradiation and the average values are higher than their initial level.

The differences in oxygen consumption in groups of highest and lowest initial oxygen consumption during irradiation is statistically significant ($P = 0{\cdot}005$).

In the control group, I have not observed any changes in oxygen consumption during the second measurement when compared with their initial values.

I have not found in the literature any reports on the relation of the individual level of respiratory metabolism before X-irradiation to the changes in oxygen consumption during irradiation in the conditions described here. Other authors claim that initial oxygen consumption values in rabbits have the same importance for rabbits during daily periods after irradiation[2]. In my experiments, I have observed that rats irradiated under conditions used in radiobiological experiments changed their oxygen consumption during irradiation in a manner dependent on their initial value of oxygen consumption.

It has been shown[3] that irradiation has changed the vegetative balance, and I presume this may be important in connexion with the changes of oxygen consumption.

These results have shown that for work on the metabolic changes in rats during X-irradiation und the described conditions it is more impor know the initial oxygen consumption va experimental animal than the aver whole experimental group of anim

dioxide with time is approximately exponential and represents an average turnover of free inositol with a half-life of the order of 6 hr. However, the cumulative percentage of injected carbon-14 appearing in the expired air differed in the two rats. In rat A, approximately 42 per cent of the administered activity had been eliminated in the expired carbon dioxide 48 hr. after the injection, while in rat B, a similar elimination was achieved in 24 hr. (Fig. 1b). These figures should be increased by approximately 5 per cent to allow for some loss of carbon dioxide at the end of each collection period necessitated by the removal and replenishing of the absorbant. The discrepancy in the percentage eliminated in the two animals is difficult to ascribe to any definite cause. Similar observations of a rapid degradation of inositol to carbon dioxide have recently been reported by Moscatelli and Larner[3], under different experimental conditions.

The specific activity of inositol in the urine of rat A reached a maximum of 142×10^3 counts/min./mgm. inositol in the sample collected 9–15 hr. following the injection. In rat B, the specific activity in pooled urine samples obtained over the experimental period was $106 \cdot 4 \times 10^3$ counts/min./mgm. inositol. Total loss of radioactivity by renal excretion amounted to 0·33 and 0·58 per cent of the injected carbon-14 inositol in rats A and B respectively.

In rat A, the specific activity in the voided faeces was 107 counts/min./mgm. inositol, and the total loss f radioactivity by this route amounted to 0·014 per nt of the injected material, while in rat B, the ecific activity was 155 counts/min./mgm. inositol d the total loss of radioactivity 0·024 per cent.

lood samples taken from rat B under light ether sthesia by cardiac puncture 9, 16 and 24 hr. after injection gave specific activities in the free ol of 315×10^3, 50×10^3 and 26×10^3 counts/ ngm. inositol respectively.

components undergoing very rapid turnover in a large non-radioactive metabolic pool would have too few counts to be detected.

The relatively rapid degradation of inositol to carbon dioxide demonstrated in these experiments is of interest and is probably accounted for by the conversion of inositol to glucose. An interconversion involving D-glucuronic acid and the pentose phosphate pathway has recently been suggested by Burns, Trousof, Evans, Papadopoulos and Agranoff[4]. Of interest also is the high specific activity present in the kidney. Charalampous[5] has recently described a renal enzyme capable of converting inositol to glucuronic acid, while Richardson and Axelrod[6] have observed the overall degradation of inositol to carbon dioxide by rat kidney homogenates.

The results reported here suggest that in the rat at least there is an active participation of inositol in intermediate carbohydrate metabolism.

BIOLOGY

Copper and Cobalt in Nitrogen Fixation

THE hæmoglobin found in the nodules of leguminous plants, first demonstrated by Kubo, has been since shown to vary in quantity with the condition of the nodules, and both Virtanen *et al.*[1] and Jordan and Garrard[2] have reported a relationship between the quantity of hæmoglobin present and the efficiency of fixation.

The role of hæmoglobin is at present not understood; but its presence implies the possibility that copper and perhaps cobalt would be associated with its synthesis in the nodule. This is supported by the finding that vitamin B_{12} is present in the nodules, and that its concentration in the pink nodules of lucerne is four times as great as in white ones[3].

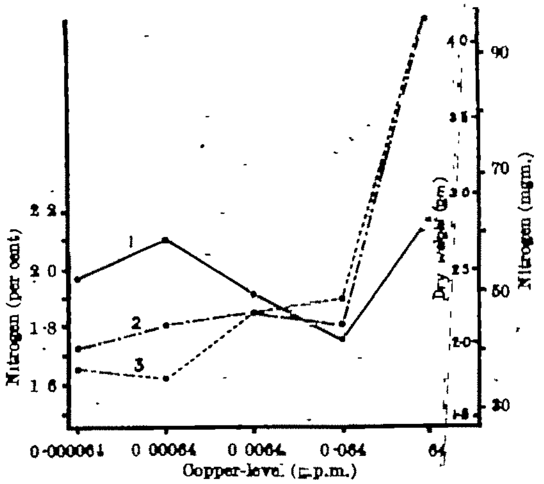

Fig. 1. (1) Per cent nitrogen; (2) mgm. nitrogen; (3) dry weight

On this premise attempts have been made in this Department to investigate the effect of variation in the level of both copper and cobalt on the growth and ability to fix nitrogen of Mount Barker subterranean clover.

In the first case a comparison has been made of the growth in sand culture (after Hewitt[4]), using a modified Long Ashton nutrient medium containing 14 p.p.m. of nitrate nitrogen, on six levels of copper supply ranging from 0·000064 p.p.m. by tenfold steps to 6·4 p.p.m. The highest level was lethal, but the results of the other levels are given below.

As the yield and total nitrogen rose with increased copper supply, the percentage nitrogen fell from the low copper treatments to the Long Ashton level (0·064). Over this range the variation in nitrogen content appears to have been a function of yield only. Between 0·064 and 0·64 p.p.m. copper, however, there was a significant increase both in percentage nitrogen and in total nitrogen content.

Analogous results have now been obtained over three seasons with another strain (Bacchus Marsh), although the level of supply at which stimulation of nitrogen fixation occurred varied from one year to the next. We have not so far been able to demonstrate any change in the haem content of the nodules between these levels of copper supply.

With cobalt, using the same technique as above, subterranean clover was planted out in the glasshouse on May 22, 1959, harvested 152 days later on October 21, 1959. The results for the plants receiving no added nitrogen are given in Table .

From this it is clear that although the highest concentration of cobalt used was restricting growth,

Table 1

	Dry weight (gm.)	Total nitrogen (mgm.)	Dry weight of nodules (gm.)
No added cobalt	5·543	154·7	0·407
0·0006 p.p.m.	5·420	154·9	0·526
0·006 p.p.m.	6·152	178·3	0·511
0·06 p.p.m.	6·365	189·3	0·341
0·6 p.p.m.	4·698	129·8	0·435

(Each seed contained about 0·41 mgm. nitrogen)

additior e rate of 0·008 and 0·08 p.p.m.
had sti gen fixation. (The effect on
the gro ant was demonstrated to the
British Science at a meeting at the
School c n September 1959.)

One cc re of our results has been that
on the g added cobalt, the nodules
increase e to those not receiving this
addition lds even in those plants on a
relatively nitrogen supply (70 p.p.m.).

Our res her that while the total hæm
produced is increased by addition of
cobalt, it n per gm. of nodular tissue
remains This, however, is markedly
depressed the nitrate nitrogen supply,
as can be ble 2.

Transmiss Disease of Cocoa

THE disease bed as 'buba' or 'cushion
gall' was first ombia in 1938[1]. It was
found afterwar r countries in South and
Central Ameri n Ceylon[2]. The disease
causes hyperpl y of floral cushions, and
is causing con of western Colombia,
Nicaragua and ere it has become wide-
spread. Galls se of the 'green-point'
type in the wes re have been known in
Ghana since 19 Following reports of the
rapid spread o disease in Costa Rica
investigations h in Ghana to assess the
distribution an of the West African
disease, and to The purpose of this
communication he transmission of the
West African d ethods which may be of immediate value to workers concerned with the American 'cushion gall' problem.

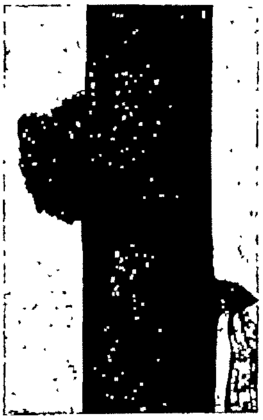

Fig. 1. Gall on mature tree. (× 2/9)

The disease has been transmitted from galls on mature trees, as well as those produced on artificially infected seedlings, by nymphs and adults of the mealy-bug species *Pseudococcus njalensis* Laing and *Ferrisiana virgata* Ckll. and also by various methods of mechanical inoculation. The first transmissions were made using the bean-feeding technique developed for use in the mealybug transmission of cocoa viruses[3]. Adults of *P. njalensis* from a naturally infested gall on a mature tree were transferred to 5 healthy cocoa half-beans at the rate of 10 insects per test bean. Three seedlings grown from these beans afterwards produced galls in the axil of the attached cotyledon (Fig. 2). In subsequent experiments, using insects from artificially colonized source galls, 18 out of 32 seedlings grown from test beans infested with *P. njalensis* and 12 of 15 infested with *F. virgata* produced galls. The disease has also been transmitted to test beans by rubbing and pricking them with macerated gall tissue and by the use of fine paint brushes first stroked over source galls or soaked in gall extracts. These methods gave a total of 47 transmissions in more than 300 bean tests, results from some of which are still incomplete.

The cause of the cushion gall disease in the western hemisphere is not known; but it has been suggested that virus-infections[4], eriophyid mites[7], a genetical abnormality, mineral deficiency or mineral toxicity, bacterial or fungal infections[8] may be involved.

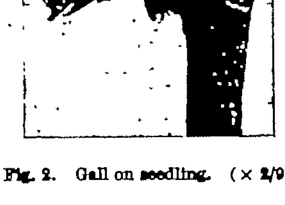

Fig. 2. Gall on seedling. (× 2/9)

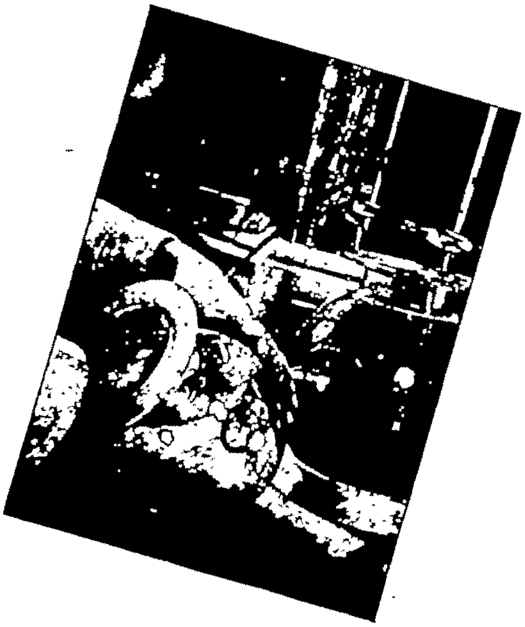

Advantages of "QUICKFIT" Open Neck Flasks

"Quickfit" manufacture and stock a complete range of open neck flasks, together with stainless steel retaining clips for use with the flanges.

The flasks can always be detached from their lids, even under conditions when conical joints tend to seize. Larger stirrer blades can be used and vessels are more easily cleaned. All "Quickfit" flasks and lids are completely interchangeable and the flask diameters are, of course, standard.

Transmission of the West African gall disease by mechanical methods in the absence of insects and other pests suggests that the disease has a pathogenic origin. Although fungal hyphæ have been observed in some stained sections of galls, only the ubiquitous *Botryodiplodia theobromae* Pat. and *Calonectria rigidiuscula* (Berk. and Br.) Sacc. have been isolated occasionally from gall-tissue. Grafting and insect transmission experiments have failed to demonstrate a systemic pathogen, and filtrates from seedling gall extracts passed through a Seitz filter (grade *EKS*, sterilizing asbestos film, Griffin and George, Ltd.) were non-infectious. Moreover, when young seedling-galls were macerated under sterile conditions in a small volume of water and centrifuged for 10 min. at 8,000 r.p.m. only the precipitate was infectious to beans. The results of these preliminary experiments indicate that the West African gall disease is of bacterial or fungal origin, although a virus cause cannot be completely ruled out.

Records from the survey[9], in which only 44 trees were found in a half-million acres of cocoa surveyed, show that the disease is at present of little economic importance in Ghana. However, because of the high infectivity of the West African disease in bean-transmission tests, and the similarity of its galls to those of the important 'cushion gall' disease in the western hemisphere, the disease is now considered to be of potential importance and the destruction of all galls on infected trees has been recommended.

Effect of Glutathione and Alloxan on the Photoperiodic Response of *Xanthium*

It has been recently reported by Brachet[1] that a morphogenetic process in the alga *Acetabularia* is promoted by a substance containing —SS— and that the same process is inhibited by substances containing —SH. It appeared of interest, therefore, to test the morphogenetic responses of higher plants to substances containing thiol groups. For this purpose the effect of reduced glutathione on the process of floral induction in *Xanthium*, a short-day plant, was investigated. Alloxan, on the other hand, was chosen as an agent known to reduce rapidly the content of reduced glutathione of blood by both oxidation and coupling reactions[2,3].

Plants of *Xanthium pennsylvanicum* Wall. were grown from seeds, kindly supplied by Prof. K. C. Hamner of the University of California, Los Angeles. The general procedure followed that described by Salisbury[4]. On December 17, when six weeks old, 60 plants were defoliated to a single leaf (third from the apex), to the exclusion of any apical leaves exceeding 4 mm. in length. Immediately after defoliation, 50 plants were sprayed with an excessive amount of freshly made reduced glutathione solutions while 10 control plants were sprayed with distilled water. All sprays contained 0·1 per cent 'Tritone-*X*-100' spreader. The experimental plants were then subjected without delay to a single inductive 16-hr. dark period. An identical procedure was carried out the next day with alloxan. After 14 days the stage of floral development was determined applying Salisbury's system[4]. In addition measurements were made of the diameter of the growing point. The length of the largest leaf retained at the apex was adopted as a criterion of growth increment.

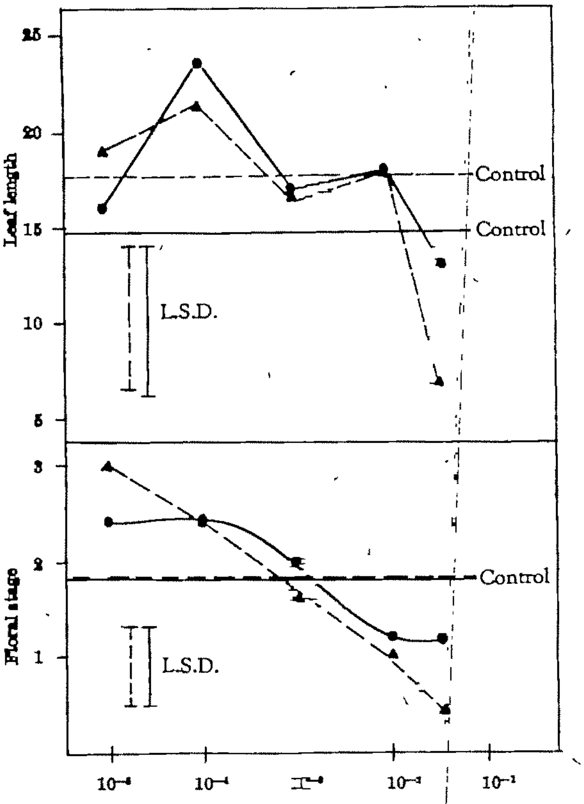

Fig. 1. Responses to different concentrations of reduced glutathione (●) and alloxan (▲)

The results show a promotive effect of both reduced glutathione and alloxan on floral development at low concentrations and an inhibitory effect in concentrations exceeding 10^{-3} *M*. A maximum effect of reduced glutathione appears to occur in the region of 10^{-5}–10^{-4} *M*, whereas in the case of alloxan the optimum concentration is possibly lower than 10^{-5} *M*. These trends were fully confirmed by the diameter measurements.

Both substances, when applied in low concentrations, exerted a promoting effect on apical leaf growth, with a pronounced maximum in 10^{-4} *M* for reduced glutathione. This substance at a concentration of $10^{-1.5}$ *M* caused a slight curling in the inductive leaf while the application of $10^{-1.5}$ *M* alloxan resulted in a partial necrosis of that leaf. Concentrations lower than $10^{-1.5}$ *M* did not produce any visible detrimental effects.

and solubility test[1]. Quite recently Mackie and Percival reported the presence of xylan in *Caulerpa filiformis* and established its structure as of β-1,3-linkage[2].

In the course of our work on the cell wall constituents of green algae we have found that each of the main cell walls of *Bryopsis maxima*, *Caulerpa anceps*, *Halimeda cuneata* and *Chlorodesmis formosana* consisted not of cellulose but of xylan, in which xylose residues are linked by a 1,3-bond. Besides these the presence of xylan also in *Udotea orientalis* and *Pseudodichotomosiphon constricta* was probable.

Of the materials used those of *Bryopsis*, *Caulerpa* and *Halimeda* were collected on the Pacific coasts not far from Tokyo and those of *Chlorodesmis*, *Udotea* and *Pseudodichotomosiphon* were obtained from Okinawa Island. Each of the air-dried algae was treated with 1 per cent hydrochloric acid at room temperature and then successively with 1·25 per cent sodium hydroxide and 1·25 per cent sulphuric acid at 100° for 1 hr. respectively. The residue was bleached with 1 per cent sodium chlorite, thoroughly washed with water and dried. Of the crude fibres thus obtained only that from *Bryopsis* gave weak but definite staining reactions for cellulose with iodine reagents, while with others the reactions were negative. None of these preparations showed optical anisotropy. On acid hydrolysis each crude fibre yielded crystalline D-xylose. Determination of xylan content by Tollens method gave the following results (per cent of moisture-free crude fibre): *Bryopsis*, 78·9; *Caulerpa*, 75·9; *Halimeda*, 78·0. From the crude fibre xylan was obtained by extraction with 10 per cent sodium hydroxide at room temperature followed by precipitation with ethanol. Purification was effected by repeating the ethanol precipitation of xylan from alkaline solution and finally by treating the product with hot water to remove soluble contaminants.

With these xylan preparations the following determinations were made, the results of which are given in Table 1.

When acted upon by sodium metaperiodate, the xylans consumed only a small amount of this oxidant as shown in Table 2.

The resistance of xylans towards periodate would indicate that xylopyranose as well as glucopyranose residues might be linked through C-1 and C-3. Assuming the 1,3-linked xylans to be of linear structure the oxidation by periodate will be restricted to the sugar residues situated at both ends of the chain, where per mole of xylan 3 moles of periodate will be reduced and 1 mole of formic acid produced. Based on the periodate consumption the degree of polymerization was calculated (Table 2), the values of which agree fairly well with those obtained by physical methods (Table 1). The 1,3-bonding of the xylans was also indicated by the production of intact

Halimeda	0·068	45
Chlorodesmis	0·045	67

xylose and glucose as hydrolysis product of the periodate-treated xylans.

From *Udotea* as well as from *Pseudodichotomosiphon* of which the taxonomical position is still in dispute, crude fibres were obtained yielding a large amount of xylose on hydrolysis. Accordingly, these algae seem to contain a xylan of similar structure.

In some moulds belonging to *Aspergillus* and *Chaetomium* as well as in the hepatopancreas of certain molluscs the occurrence of enzymes was recognized which hydrolysed the xylans to xylose.

All these observations would indicate that the major constituent of these siphonaceous green algae, *Bryopsis*, *Caulerpa*, *Halimeda* and *Chlorodesmis*, and probably also that of *Udotea* and *Pseudodichotomosiphon*, is xylan with 1,3-linkage, which might correspond to so-called callose of these algae. Interesting in this respect is the observation that the 'callose' of *Codium*, unlike that of *Halimeda*, *Chlorodesmis* and *Udotea*, all of which are included usually in Codiaceae, is represented not by xylan but by mannan[3].

We wish to thank Prof. S. Segawa, Drs. M. Chihara, S. Kamura and Y. Miyazawa for their generous support.

Bacterial Effect and Radiophosphorus Assimilation in Organic and Inorganic Forms in Salmon

Approximately 90 per cent of phosphorus present in the body of a fish is found in the skeleton. The remaining 10 per cent is chiefly intracellular and plays a major part in energy-transfer mechanisms. The reservoir of phosphorus in the skeleton is also of great importance in maintaining adequate levels of this element in the tissues. Fish selectively absorb inorganic salts from water, and concentrate in various tissues the elements of which these salts are composed[1,2]. Furthermore, freshwater fish do not swallow water nor absorb salts through their skin but they carry on salt exchange only across the gills[3,4]. The present work was taken up to study the effect of bacteria and radiophosphorus assimilation in organic and inorganic forms in salmon, *Salmo salar* L.

By the courtesy of the Canadian Fish Cultural Development Branch, yearling salmon were brought from the Grand Lake rearing ponds and placed in a temperature-controlled room at 10 ± 1° C., where they were given two days to settle down to the conditions of the laboratory. The experimental aquaria were in two sets, to one of which antibiotic tetracycline was added (0·1 gm. per litre) and left for 4 hr. so that the bacteria would be inactivated. Phosphorus-32 (Atomic Energy of Canada, Ltd.), in the form of phosphoric acid in diluted hydrochloric acid, was then added to both sets to give an activity of 2,100 counts per min. per ml. After 2 hr., fishes, which were roughly of the same size and weight (approximately 15 gm.), were put in both the sets. When phosphorus-32 was added to water in inorganic form a considerable portion is either ingested or transformed into organic form by bacteria and a condition of equilibrium is reached in about 24 hr.[5,6].

From each set, henceforth called control and treated (with antibiotic), four fishes were taken out at regular intervals and their tissues (liver, kidney, muscles, brain, heart and bone) were variously treated for counting the radioactivity. All the readings were corrected for decay and were standardized according to the uranium standard readings. When phosphorus-32 entered the body of the fish its distribution in the tissues was similar in both sets, bone taking up the maximum followed by liver, kidney, heart, muscles and brain. In the initial stages, up to about 24 hr., the uptake of radiophosphorus in both treated and control was almost similar. This can be explained by the fact that radiophosphorus in the control had not yet become completely equilibrated so that most of the radiophosphorus in both sets was in the inorganic form. After 24 hr., the uptake in treated set went up. In treated set, fishes could take up from water 39·6 per cent of phosphorus-32 and the control only 27·5 per cent. The turnover-time, which may be defined as the time required to renew completely the amount of substance present in the tissue, was calculated both for water as well as fish, and it came to 116·1 and 54·7 hr. in treated and 142·2 and 71·4 hr. in control respectively. These experiments indicate that fish absorbed more phosphorus-32 from the aquaria which had all the phosphorus in inorganic form. In the control, where three-fifths of phosphorus was transformed into organic form, the uptake was low.

The question which still remains to be answered is whether fishes can absorb phosphorus in organic form or not ? If so, what is the relationship between the two ? Another set of experiments was arranged to answer this question. Large quantities of phosphorus-32 were added to the aquaria and left for two weeks, after which the water was passed several times through a demineralizer until all the inorganic phosphorus was eliminated. Then it was passed through a millipore filter, which removed all the bacteria, and only phosphorus-32 in organic form was left in water. In other aquaria inorganic phosphorus-32 was put in water and tetracycline was immediately added to both the sets so that the activity of bacteria would be suppressed. In 144 hr., fish could absorb only 24·5 per cent of radiophosphorus in organic form, whereas in inorganic state they could utilize 43·0 per cent. The turnover time for water and fish came to 156·0 and 82·6 hr. for fishes maintained in organic phosphorus-32 and 107·[illegible] and 51·8 hr. for fishes kept in inorganic phosphorus-32.

river about 10 miles to

the south was being kept under observation this was considered to be a sufficient control.

To assess the fly population before spraying, twenty fly-catching points were chosen at nearly equal intervals along the length of the river. Four teams of two fly catchers each visited five points during a day, spending 1 hr. at each point, so that both rivers were completely inspected daily. The number of flies caught was recorded and the flies released at the end of each hour before moving on to the next point.

In contrast to the formulation used in the previous trial, where wettable powder was used, the spray was prepared from a water-miscible concentrate containing 20 per cent dieldrin and packed in 5 gal. drums. One part of this concentrate was added to four parts of river water, giving an emulsion containing 4 per cent dieldrin. The sprayers used were five 2-gal. 'Eclipse Warley' pneumatic sprayers.

It was found that a great advantage of using this preparation was that the concentrate could be added directly to water in the sprayers and therefore no bulk mixing or carrying of mixed solution was necessary. Spraying was concentrated mainly on all tree trunks and leaves up to 4 ft. from the ground throughout the width of the riverine vegetation, special attention being paid to fallen logs and the undersides of leaves overhanging the river-bed. Immediately after spraying the emulsion left a deposit from which the water phase evaporated after about 15 min., leaving the almost invisible oil phase. It was not until some 24 hr. later that a white deposit of crystals could be seen on the foliage. To eliminate the risk of spraying twice or of under-spraying due to being unable to see what had been sprayed before, a man with a matchet followed each sprayer and slashed trees that had been sprayed so that those following behind would know what had been already treated.

The effect of the insecticides on the fly population was immediate; the average daily total catch over all points for the week before spraying had been 31 *Glossina palpalis* per day (no *G. tachinoides* were present for the few weeks preceding the trial) and since early December 1957, when spraying took place, until December 1958, when fly rounds were discontinued, no flies were caught or seen on the river. This is in direct contrast to the results obtained using DDT, when a gradual fall-off in population was experienced. It has been noted previously in the Northern Guinea Savannah Zone, for example, in Katsina and Kano Provinces, where a single application of DDT is now used as a routine measure, that an absolute kill immediately following the application usually forecasts the success of the project. There was no significant drop in fly population on the control river.

In all, 52·5 gal. of water-miscible concentrate were used to treat the 4·5 miles of river, at a rate of 11·7 gal. of 20 per cent dieldrin per mile, the whole operation taking six working days to complete. The cost of spraying came to £41 per mile, which, in spite of the increased initial cost of dieldrin, compares very favourably with DDT, where the cost was £50 10s. per mile for five applications. Partial clearing by paid labour on this river would have cost between £100 and £200 per mile.

The use of dieldrin, if it is found in other cases to be as successful as the one just described, will represent a saving not only in the cost of the materials and transport, by needing only one application as against four or five applications of DDT, but also in that a small spraying unit should be able to cover a length of river five times greater than would have been possible in the same time had DDT been used.

On the strength of the success of this trial a river system in the south comprising some 60 miles of river was treated with dieldrin as a field trial early in 1959 and the results so far are encouraging.

This communication is published with the permission of the Ministry of Health, Northern Nigeria, and the general administration and supervision of the fly rounds was carried out by Mr. J. Milton, sleeping sickness control officer.

CYTOLOGY

Acetone Fixation for the Cytochemical Demonstration of Dehydrogenases in Blood and Bone Marrow Cells

The demonstration and localization of certain dehydrogenases within cells has been achieved cytochemically by exposing the cells to appropriate substrates upon which the dehydrogenases may act, in the presence of tetrazolium compounds capable of accepting hydrogen with the production of coloured insoluble pigments (formazans). The most satisfactory tetrazolium salt for this purpose is 'Nitro *B.T.*', a *p*-nitrophenyl substituted ditetrazole, which, under appropriate conditions, readily yields a finely granular formazan deposit[1,2].

The application of this technique to the study of blood and bone marrow cells has been hampered by problems of fixation, since fixatives giving adequate cell preservation generally inactivate the enzymes. Using air-dried smears of blood or bone marrow we have found this to be the case with most common fixatives, including methanol, ethanol, formalin solutions and formalin vapour. Attempts have been made to overcome the difficulty by allowing fresh suspensions of heparinized blood or marrow cells to react with the enzyme substrate and tetrazolium compound in test-tubes, smears then being made of the centrifuged deposit and afterwards fixed and counter-stained[3]. Unfortunately, considerable cell damage tends to occur during incubation and centrifugation, and accurate cell identification proves difficult to achieve.

There has recently been increasing interest in acetone as a fixative for enzyme cytochemical work, since it appears less inimical to enzyme activity than most other fixatives[4,5]. We have therefore carried out a series of experiments using different concentrations of acetone, alone or in various combinations with methanol, ethanol or formalin, at different temperatures and for different periods of time, as fixatives applied to air-dried smears of blood or bone marrow prior to incubation in the substrate–tetrazolium mixtures for cytochemical detection of succinic and lactic dehydrogenases. Mixtures of acetone with other fixatives generally gave excellent cell preservation, but invariably reduced enzyme activity, even when used for only 30 sec., whereas solutions of acetone alone allowed strong enzyme reactions to occur while providing, after an exposure of 30 sec.–1 min., a degree of fixation quite adequate for identification of cells and for enzyme localization at an intracellular level. The most satisfactory concentration of acetone was 60 per cent in distilled water, preferably used at room temperature, since ice-cold acetone solutions tended to wash off smears from the slides. Consistent and reproducible results were obtained with this method of fixation, and there appeared to be no decrease in enzyme activity in smears kept for 5–6 hr. before fixation. After this time dehydrogenase activity lessened, but was still detectable at 24 hr.

The full technique we have used for dehydrogenase cytochemistry in blood and marrow smears may be summarized as follows:

(1) Blood or marrow is smeared directly on glass slides and allowed to dry in air.

(2) Within 5–6 hr. the smears are treated with 60 per cent acetone in distilled water at room temperature for 30 sec.–1 min., rinsed in distilled water and air-dried.

(3) After fixation the smears are incubated for 1 hr. in the appropriate substrate, for example, for succinic dehydrogenase:

Phosphate buffer 0·2 *M* pH 7·4	10·0 ml.
Sodium succinate 0·2 *M*	10·0 ml.
Sodium bicarbonate 0·6 *M*	2·0 ml.
Calcium chloride 0·03 *M*	0·2 ml.
Aluminium chloride 0·03 *M*	0·2 ml.
'Nitro *B.T.*'	10 mgm. in 10 ml. of distilled water
Distilled water	to 40·0 ml.

(4) The smears are then rinsed with distilled water, dried and counterstained with 0·1 per cent nuclear fast red for 10 min.

Acetone not only provides a reasonable degree of fixation without inhibiting dehydrogenase activity, but also removes lipid particles on which the coloured formazan may otherwise be falsely localized. The pattern of positivity in leucocytes revealed by

non-interacting and retaining their shape and number. But according to the equation the mass (= deoxyribonucleic acid-content) must remain constant, no synthesis can therefore take place, and this is contradictory to experimental facts. We can therefore conclude that in spite of the finding that the equation describes the data well, it does not mean that the nuclei are homogeneously absorbing objects. A non-random distribution of the Feulgen-stain was observed by DeSmul and LeComte[9], and reconstructions of serially cut human and rodent somatic nuclei in this laboratory[10] have shown that the Feulgen-stained material and the nucleoli are distributed in a peripheral zone. We can therefore conclude that the absorbing material, that is, deoxyribonucleic acid, is not randomly distributed and consequently that published data on the total nuclear deoxyribonucleic acid content, calculated from cytophotometric measurements of fixed tissue assuming a random distribution of the absorbing particles, are erroneous. The linear relationship between the nuclear absorbance and the inverse nuclear surface area may simply mean that both the absorbance and the geometrical dimensions are dependent variables of a common variable as, for example, the growth process, thus:

$$E = f_1(X) \text{ and } D^2 = f_2(X)$$

A practical consequence of this is, as is also evident from the equation, that a simple measurement of the nuclear geometrical dimensions will yield the same information as that obtained by the far more complicated and costly photometric method.

The numerical value of the constant b, which may well have different absolute values for different tissues, is thus not a direct measure of mass, but is a measure of the rate at which the absorbance decreases for unit surface area increase over a given mass range. For nuclei retaining their ploidy the growth process results in a doubling of the chromatin mass (deoxyribonucleic acid) and an increase in size between two consecutive divisions. As the relative mass of nuclei of different ploidy has the value of 1 : 2 : 4 . . ., it follows that for a stationary population of nuclei of different ploidy the relative numerical values of the constant b will show this ratio. If transitions from one nuclear class to another occur the relative value of b will depend upon the intensity of transition. Deviations in the relative values of b from 1 : 2 : 4 . . . can accordingly be interpreted as a measure of the degree of cell differentiation. We would therefore expect, as also found by Moore[11], that the degree of deviation from the ratio of 1 : 2 : 4 varies from individual to individual as well as with age.

FORTHCOMING EVENTS

Tuesday, July 5

Institute of Physics (at 47 Belgrave Square, London, S.W.1), at 5 p.m.—Annual General Meeting.

Tuesday, July 5—Friday, July 8

Fourth International Goitre Conference (at Church House, Great Smith Street, Westminster, London, S.W.1).

Wednesday, July 6

Bone and Tooth Society (at 234 Great Portland Street, London, W.1), at 4 p.m.—Annual General Meeting, followed by Scientific Papers.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Lecturer or Lecturer (preferably with suitable qualifications in entomology) in the Department of Zoology—The Registrar, The University, Liverpool, quoting Ref. CV/N (July 9).

Junior Lecturer (with a medical degree and preferably a degree in physiology) in Physiology—The Secretary, The Medical College of St. Bartholomew's Hospital, West Smithfield, London, E.C.1 (July 11).

Research Assistant in the Department of Botany, to carry out research with Dr. L. Fowden on nitrogen metabolism—The Secretary, University College, Gower Street, London, W.C.1 (July 11).

Temporary Lecturer in Medical Physics in the Department of Medicine—The Registrar, The University, Manchester 13 (July 11).

Biochemist, Basic grade (preferably with previous experience in steroid work), to work in general clinical biochemistry, under the direction of the Consultant Biochemist—The Secretary, Edmonton Group Hospital Management Committee, North Middlesex Hospital, Silver Street, London, N.18 (July 12).

University Lecturer in the Department of Applied Mathematics and Theoretical Physics—Dr. F. G. Friedlander, Secretary of the Appointments Committee of the Faculty of Mathematics, The Arts School, Bene't Street, Cambridge (July 13).

Research Assistant (Physicist) in the Ceramics Division of the Houldsworth School of Applied Science, to undertake an investigation of the influence of dissolved water on the physical properties of glass—The Registrar, The University, Leeds 2 (July 15).

Chemist, Assistant Experimental Officer or Experimental Officer grade, in the Pedology Department—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (July 16).

Lecturer or Assistant Lecturer (preferably with an interest in experimental study of molecular structure by diffraction techniques) in Inorganic or Physical Chemistry—The Registrar, University College of North Staffordshire, Keele, Staffs (July 16).

Lecturer or Assistant Lecturer (with a special interest in inorganic chemistry) in Chemistry—The Secretary and Registrar, The University, Southampton (July 16).

Lecturer (with special competence in statistical and experimental methods) in Psychology—The Secretary, The University, 36 North Bailey, Durham (July 16).

Assistant Lecturer in the Department of Chemistry and Biochemistry—The Dean, St. Thomas's Hospital Medical School, London, S.E.1 (July 18).

Demonstrator (with an honours degree in chemistry or biochemistry, and prepared to engage in research in biochemistry with a view to obtaining a higher degree in this subject) in the Department of Chemistry and Biochemistry—The Dean, St. Thomas's Hospital Medical School, London, S.E.1 (July 18).

Senior Lecturer (with a first- or second-class honours degree in mathematics, and teaching experience in both pure and applied mathematics) in Mathematics at the Royal Naval College, Greenwich, London, S.E.—The Civil Service Commission, 17 North Audley Street, London, W.1, quoting Ref. S/5154/60 (July 21).

Senior Lecturer (with a science degree specializing in geology, research experience in igneous and/or metamorphic petrology to Ph.D. or comparable level, an interest in field work, and preferably some overseas experience) in Geology (Petrologist) at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, or The Registrar, University of Queensland, Brisbane, Queensland, (Australia and London, July 29).

Senior Lecturer and a Lecturer in Applied Mathematics at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Cape Town and London, July 30).

Professor of Physical Chemistry at the University of Natal, Durban, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa and London, July 31).

Senior Lecturer or Lecturer, to be responsible for courses in forest botany at graduate and postgraduate level; and a Lecturer (with research interests in either tree physiology and sylviculture or forest zoology) in the Department of Forestry—The Secretary, The University, Aberdeen (July 31).

Lecturers (qualified in some branch of applied thermodynamics or applied mechanics, including automatic control, or engineering materials) in Mechanical Engineering—The Secretary of University Court, The University, Glasgow (August 6).

Metallurgist (with a science degree, preferably with honours or equivalent, and experience in metallurgical research) in the Research Laboratories, Australian Post Office, Melbourne, for research into the properties of metallic protective coatings, the investigation of metallurgical failures and the analysis of metals, etc.—Australian Post Office Representative, Australia House, Strand, London, W.C.2 (August 8).

Senior Lecturer (with medical qualifications or higher degrees in physiology) in the Department of Physiology, University of the Witwatersrand, Johannesburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa and London, August 15).

Statistician, Scientific Officer or Senior Scientific Officer grade (with a good honours degree and preferably postgraduate experience)—The Secretary, East Malling Research Station, near Maidstone, Kent (August 22).

Lecturer (with an honours degree in psychology, together with acceptable qualifications and practical experience in clinical psychology) in Psychology at the University of Canterbury, Christchurch, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand and London, August 31).

Lecturers (2) in Geography at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, August 31).

Senior Demonstrator (graduate) in Zoology at the University of Western Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 31).

Basic Grade Biochemist (graduate in chemistry or biochemistry), to work in the Group Pathological Laboratory under the supervision of the Principal Biochemist—The Group Secretary, Reading and District Hospital Management Committee, 3 Craven Road, Reading.

Biochemist (non-medical), for hospital biochemical work in the Mansfield Area Pathology Service—The Hospital Secretary, King's Mill Hospital, Sutton-in-Ashfield, Notts.

Chemist (with an honours degree in chemistry, some veterinary/agriculture or medical experience, and some experience in biochemistry) with the Government of Tanganyika, to supervise the Chemical Section of the Veterinary Research Laboratory, duties will include frequent safaris for experiments in the field—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.63/8/020.

Chief Electronics Technician, to assist in the developments related to cardiac surgery—The Assistant Administrator, Radcliffe Infirmary, Oxford.

Dean of the School of Pharmacy—Chairman of the School Council, School of Pharmacy (University of London), 29-39 Brunswick Square, London, W.C.1.

Lecturer (experienced graduate teacher with a knowledge of psychology) in Education in the College (Training Department and School of Art)—The Warden, University of London, Goldsmiths' College, London, S.E.14.

Lecturer (qualified to teach physiology or comparative animal physiology to degree level) in Physiology or Comparative Physiology—The Registrar, Bradford Institute of Technology, Bradford 7.

Lecturer (single, male, preferably specializing in entomology and/or animal physiology) in Agricultural Zoology and Assistant Warden—The Clerk to the Governors, Essex Institute of Agriculture, Writtle, near Chelmsford, Essex.

Lecturer (well qualified physicist with research and/or industrial experience, and with, or prepared to develop, a strong interest in the physics of materials) in Physics—The Principal, Rugby College of Engineering Technology, Eastlands, Rugby.

Post-Doctoral Fellow in Organic Chemistry—Dr. R. A. Abramovitch, Chemistry Department, University of Saskatchewan, Saskatoon, Canada.

Research Assistant (with a good honours degree in psychology, and preferably postgraduate training in psychology), to help in the investigation of intelligence and memory functions in normal and psychiatric elderly subjects at Bethlem Royal Hospital, Beckenham, Kent—The Secretary, The Institute of Psychiatry, The Maudsley Hospital, Denmark Hill, London, S.E.5, quoting Ref. R.F.94.

Research Chemist (graduate in chemistry with research experience), for analytical studies in soil and tissue—The Chairman, Dental Committee, Medical Research Council, P.O. Box 647, Dunedin, New Zealand.

Scientific Officer (honours graduate in biology/zoology) in the Biophysics Section, for work relating to the physical-chemical basis of virus-antibody relationships and other aspects involving serological and biological assay—The Secretary, Research Institute (Animal Virus Diseases), Pirbright, Surrey.

Scientific Officer (male or female, with an honours degree in science, pharmacy or biology), for duties which will consist of technical work in the Blood Transfusion Service Laboratories—The Director, Blood Transfusion Service, Roby Street, Manchester 1.

Scientific Officer (with a first- or good second-class honours degree), to work in the Cardio/Thoracic Laboratories—The Secretary to the Board, The General Infirmary, Leeds 1).

Senior Research Technician (with a knowledge of electronics and vacuum techniques, and preferably previous experience in electron microscopy), to assist in research projects of biological and medical significance—The Secretary, St. Bartholomew's Hospital Medical College, West Smithfield, London, E.C.1.

Technician (preferably with some laboratory experience in cytology or histology) for Cancer Research Laboratory—The Administrative Officer, Mount Vernon Hospital, Northwood, Middlesex.

Technician (with experience in routine histology) at the Royal Cancer Hospital, Chester Beatty Research Institute, Fulham Road, London—The Secretary, Institute of Cancer Research, 33 Sumner Place, London, S.W.7, quoting Ref. 801/B/32.

Visiting Lecturer (with previous experience in the teaching of philosophy at university level) in Philosophy—The Chairman, Department of Philosophy, The University of Kansas, Lawrence, Kansas, U.S.A.

CO-OPERATION AND SCIENTIFIC AND INDUSTRIAL RESEARCH

THE dominant impression left by a first reading of the third report from the Council for Scientific and Industrial Research, for the year 1959*, is the effort which the Council has made to provide the basis for informed judgment as the balance of the Department's effort. A new feature appears in the appendixes giving the percentage distribution of effort in the Department's research stations, 1960–61, based on the cost of staff working in particular fields in relation to the cost of total staff of the station; taken with the analyses hitherto regularly provided of the distribution by subject or field of study of research grants, studentships and fellowships, this enables the detail of the Department's contribution to the research effort of Britain to be seen more clearly. A summary of the more important financial items appears elsewhere in this issue (p. 118). With this goes a determined effort to further co-operation between the various research organizations with which the Department is concerned; this is, indeed, distinguished as one of three central themes of the report, and a feature which is likely to grow as the Council identifies, and endeavours to meet, the present and emerging needs of Great Britain for scientific and industrial research.

To this comment, one reservation must be made. The veil hitherto drawn over the activities of the Department's information or intelligence division remains unlifted. Nothing is said about the expenditure on this division, which has now been merged with the Overseas Liaison Division, and only passing reference is made to the National Lending Library for Science and Technology, apart from the appointment of a consultative committee, the representation of users on which has already drawn some adverse comment. The report refers, indeed, to the establishment last year of an *ad hoc* committee under Sir Walter Drummond to review the activities of the Headquarters Information Division and to consider how extra money might best be spent, between now and 1966, by the Division and on a scheme for assisting research associations to conduct special experiments in communication.

This Committee reported later in the year, and the Council accepted its proposals, though they are not specified. It is merely stated here that the proposals involve three main groups of services: publicity, chiefly through the mass media; publications; and stimulation of regional information services. The Council is convinced that there should be a general increase in publicity services, particularly for the Press, radio and television, and it is recruiting the necessary staff. As regards publications, its main concern is to present the Department's scientific work to wider audiences at all levels in industry, chiefly through brief summaries of useful information made available by research and through reviews of recent achievements in selected fields of inquiry. It is already supporting five regional technical information services from Conditional Aid Funds, based on Birmingham, Bristol, Cardiff, Manchester and Newcastle, and proposes to continue this support, subject to satisfactory reports on their existing and potential value for industry and to the continuation of local support. It is also proposed to consider well-founded proposals for assistance to new centres, provided there is evidence of adequate local backing. Concurrently, it is expanding the Scottish and Welsh offices of the Department.

This policy seems to be sound and reasonable, but there are two comments to be made. First, if its value is so clearly demonstrable, such a service should not be dependent on Conditional Aid Funds. Secondly, it may be questioned whether such regional technical information services could not be more efficiently and economically developed as part of the public library service as a whole. Action on the Roberts Report is still awaited, and Britain's technical and other resources are too limited to permit duplication or dissipation. It is difficult to regard the divorce of the project for a National Lending Library for Science and Technology from that for a Central Reference Library covering those fields as other than a reprehensible waste of resources and man-power. Full efficiency can only be secured as part of a genuine national system which takes full account of local resources, and the very growth of the Department's effort in the field of information makes some annual account of that effort increasingly desirable in the national interest—an account which will display that effort quantitatively as well as qualitatively between the various sections of the Information Division, the National Lending Library for Science and Technology and the grant-aided bodies, such as the Association of Special Libraries and Information Bureaux. There may be good and sufficient reasons for not publishing the report of the Drummond Committee itself; but merely as a contribution to the growing concern for co-operation between the various organizations which the Council maintains or assists it is important that full information as to their activities should be made available.

This is, in fact, a useful means of strengthening the links between research stations, the research associations, the universities and the colleges of technology—links which have this year also been reviewed by the Council. The Council comments in the present report on three new ways in which relations can be developed, apart from strengthening existing contacts and making more use of consultants and of students during the vacations. First, in awarding renewable

grants under the five-year plan has been insufficient to support all applications of sufficient merit, and this appears to be equally true of grants for nuclear physics.

With Treasury concurrence, however, the Council is entering into commitments for research grants at a substantially higher level than was contemplated in the plan, and this level will be reviewed year by year; this arrangement should enable the Council to support all applications which seem to be worth while. In 1958–59, 295 grants totalling £2,232,000 were finally made, including 52 (£826,000) in nuclear physics and 14 (£137,000) in the human sciences, compared with 119 awards totalling £445,000 in the previous year. The Department is also now the national centre for administrating the scheme for Senior Visiting Fellowships of the Organization for European Economic Co-operation, as well as the Studentships and Fellowships for Britain of the North Atlantic Treaty Organization. Postgraduate awards also expanded steadily and smoothly, although the scheme for Advanced Course Studentships did not develop so rapidly as expected.

While the Council reports that the Department now has the staff needed to handle the continued expansion of the schemes for research grants and training awards and at the same time to visit the universities and colleges of technology more often, it is obvious that the educational function of the Department will need to be kept continually under review. The Department is already playing an important part in the development of university and technological education in Britain as in our research effort, and the Minister for Science will need to have regard to its work here as well as in research. There may be implications, too, for the Minister of Education, as indeed Lord Hailsham seemed to hint at the end of his speech in the House of Lords debate on university education on May 11. Lord Hailsham raised explicitly the question whether our arrangements for co-ordination between the universities and other places of higher education are satisfactory, referring in particular to the use and location of expensive equipment such as cyclotrons, and stating that he has already asked the secretaries of the Research Councils to examine the question of the use of central facilities by universities and the use by universities of research facilities available in Government research institutes.

All these matters indeed merge into the broad question of co-operation generally which was discussed at the outset, and this question recurs in the third main theme to which the Council directs attention in the present report: the consolidation of changes which have been made in previous years in the functions and organization of some of the Department's research stations. Here the Council announces the completion of its survey of present and projected research. This year it has made no new changes in organization or scope of work. The review, however, has led the Council to reconsider the broad aims and functions of the stations as a whole, and perhaps one of the most important passages in the report is that which sets forth the re-definition of the terms of reference of the research stations. Taken with the analysis of the distribution of effort already noted, it facilitates accurate assessment of the character of their contribution to the nation's research effort and the identification of gaps or weaknesses.

Basic research at the research stations, in the Council's view, must be directed to the general advancement of technology and applied science, although each station should be free to follow up new ideas falling within its sphere of interest and thus include some research not directed towards any immediate need of industry or the Government. Stress is laid on the need for each station to limit its work to selected carefully defined objectives, the criteria for selection being the end to which the work is directed. Directors are also to ensure that the appropriate Government interests are linked as closely as possible with the work of the station and, in consultation with research associations where appropriate, to secure financial or other co-operation with industry.

Within these terms of reference, the major purposes of the research stations may be catalogued as follows: keeping their fields of research under constant review in order to define objectives and help the Government, industry and the public to maintain a lively interest in the value of research; conducting research which can provide information to the central and to local government on matters such as air and water pollution, road safety, noise, and the extinction and prevention of fires, in which the Government has a clear responsibility for protecting the health, safety and welfare of the citizen; carrying out research and development in subjects, such as the natural resources of the country and the design and construction of buildings and roads, which are important to the Government and which affect the efficiency of industry as a whole; extending the frontiers of knowledge in applied science so that industry can be provided with the basic information required for the solution of particular problems; paying special regard to the research needs of industries that lack an adequate scientific background, and to research problems that are common to more than one industry; carrying out particular researches, in co-operation with industry wherever possible, which will enable the stations to appreciate industry's problems more fully and to recognize those fields in which more basic research is most urgently needed; providing for industry national and international standards of measurement of various fundamental physical quantities (such as length, mass and time), related secondary standards and reference materials; conducting research on matters of broad public interest; and disseminating the results of research and securing their application.

The Research Council emphasizes the last of these functions, believing it is increasingly important for the research stations to promote good relations with the users of research results. But by and large, these objectives demonstrate conclusively the reason for the existence of Government-maintained research stations. In their absence much of the work indicated is unlikely to be undertaken, or at the most in very piecemeal fashion. So far, however, as extending the frontiers of knowledge in applied science is concerned, it may be necessary to review continuously the relations of the research stations with the colleges of technology. If the latter are to develop adequately and make their full contribution to the supply of technologists, a very considerable extension of research in applied science in the colleges themselves is needed, and there may be the less need for such research by the Department's own stations. It might be noted in passing that several of the Department's stations carry out work on behalf of Colonial or overseas territories for which the Overseas Research Council might otherwise need to make special arrangements, though the Overseas Research Council is not mentioned in this report.

Three other areas of research in which opportunity for co-operation has arisen are, however, specially mentioned. First, research on creep, for which a new building is being erected at the National Engineering Laboratory, and a Creep Information Centre has been opened; the Electrical Research Association is planning an extended programme of tests designed to give new information on steels and temperatures of particular relevance to steam-raising plant and turbines for generating electric power. The National Physical Laboratory will analyse and evaluate the relevant metallurgical data, and a Committee of the British Iron and Steel Research Association is organizing co-operative creep-tests by several steel firms. Secondly, a committee has been set up under the chairmanship of Sir Alfred Pugsley to consider what research needs to be done into the fatigue of engineering structures made of metal, to survey existing research facilities and make recommendations. The third example is in shipbuilding research, and the Council emphasizes its concern that the resources of the National Physical Laboratory, including the new Ship Hydrodynamics Laboratory at Feltham, shall continue to be used to the full along with those of the British Shipbuilding Research Association and the Parsons and Marine Engineering Turbine Research and Development Association.

On the distribution of effort, it must suffice to mention the much greater emphasis the Radio Research Station is placing on research related to the Government's space programme. About half the Radio Research Station's research effort is now to be devoted to space investigation. Its study of the propagation of radio waves is to be widened, taking advantage of the new techniques provided by rockets and artificial Earth satellites. Its present studies of the world distribution of radio noise are to be supplemented over the entire radio-frequency spectrum, and later it is likely to supplement the work at Slough in predicting the tracks of satellites, and at the sub-station in Singapore, with radio telescopes and other specialized equipment. Since, however, the Department's expenditure on radio research in the year ended March 31, 1959, was a little short of £200,000 out of some £8,000,000, even with £12·7 million provided in the 1960–61 Civil Estimates,

CAL AND MODERN
ENCE

Causality
The Place Principle in Modern Science.
By Prof. Pp. xx+380. (Cambridge,
Mass.: Ha ty Press; London: Oxford
University 60s. net.

THIS is ok by an unusual man in a
most u . The author is professor of
theoretical hilosophy of science. The
university of this stupidity or bold
initiative, y be, is Buenos Aires. The
author is a criticism, for he is not only
thoroughly his two fields and presents
his work w ty, but also he has a strong
sense of rel lance. Despite the fame of
the subject o find a book of this length
devoted to o written without wasting
words. Th is far from epoch making,
it is of an o er of competence and value,
indispensab o those who may wish to
enlighten t the subject, but even to
specialists c Of those who have thought
carefully a ut this subject, there must
be few who are of the great complexity
and detaile ls that they will find here.
In short, t not transform our view of
causation, I the whole matter in such
balanced a rspective that anyone who
attempts to out knowing this book may
well be re having graduated in the
subject.

The broa e put as follows. Few will
require to b at not all laws and explana-
tion in phy l; in fact, the pendulum
has swung ny deny that the principle
of causation has any role at all. Against this view, the author argues patiently and temperately to point out that causal laws and causal explanations do in fact exist, but he is emphatic that they are not the only kind; but he also holds that there are quite a number of non-causal types of law and explanation, and he describes these carefully. In short, his thesis is that the principle of causation takes an important role, though not a dominating one. It may be remarked that this may sound insipid, but if so, it is not insipid through compromise, but because, if the author is right, the world is governed by heterogeneous types of law. Another important part of the thesis is this. Certain thinkers, whom the author calls romantic, have denied that the causal relation connects one event with another event; and they have done so on what the author considers the correct grounds that every event is connected in innumerable ways with all sorts of other events and therefore that an event is not simply nicely and neatly connected with another one as, say, its cause. On the other hand, the romantics go on to deny that causation has any role because of the warp and weft in which events find themselves. This the author disputes, because it rests upon a misunderstanding of the nature of scientific laws, which, whether causal or not, deliberately abstract from the warp and weft and for scientific purposes isolate events satisfactorily.

The one main criticism to which this book would seem to be open is that it may fail to satisfy those who regard statistical laws as having superseded causal laws. Such critics would doubtless concede the existence of causal laws as described by the author, but insist that these should be reducible to statistical terms. It would be interesting to know whether they regard such a contention as a purely scientific one (in which case they would be refuted by the fact that science contains both types of law) or as a piece of philosophy of science (they would probably agree that it was the latter). Then the contention would seem really to concern the ultimate nature of scientific laws, and it is not easy to see what bearing this contention would have upon science itself. Further, it would be interesting to know how its exponents would set about proving the contention.

It would be valuable if critics would commit themselves on these points and if Prof. Bunge were to make a detailed reply. He would no doubt do so highly effectively.

J. O. WISDOM

AUTOMATIC PROGRAMMING IN THE U.S.S.R.

Programming Programme for the BESM Computer
By A. P. Ershov. Translated from the Russian by M. Nadler. Edited by J. P. Cleave. Pp. vi+158. (London and New York: Pergamon Press, 1959.) 60s. net.

AUTOMATIC programming is aimed at allowing us to present to a computer a statement of our problem in a form as close as possible to that in which we are used to expressing ourselves. This may be a mathematical form for the scientist or mathematician or perhaps 'technical English' for the business man.

The book under review describes Russian work along these lines based on a "symbolic or pseudo-mathematical" form. In my view this work is marred by the fact that the *Besm* computer used can only accept numerical forms of information so that all the symbolism has to be recoded. It is true that the programming programme *P.P.* ('compiler' would be better understood) removes from the programmer the necessity for detailed coding of loops, operators, minimization of working space and so on, but I cannot believe that the automatic nature of the coding "practically rules out the chance of error".

The value of this book is greatly reduced by its shoddy presentation. Why must we have the translator's typewritten notes? Smudges and smears make a number of tables and diagrams ambiguous.

Part 1 of the book describes the symbolism which the programmer must use. I feel a less fearsome notation could have been chosen. (See example on p. 21.) The numerical coding of this symbolism is inadequately described. Part 2 describes techniques for programming such things as loops, operators, and working-space economy. This is marred by the quality of some of the flow diagrams. The notation of these diagrams is not described until Part 3. This Part describes the *P.P.* itself and is the most detailed part of the book. There is undoubtedly some very useful information here.

After some rather optimistic conclusions follows a brief review of the *Besm* programming system. This part would have better been at the beginning, for implicit references are made to it earlier in the book. The ideas would have been easier to digest if more examples had been given. When these are given they are often incomplete or contain errors. The illustration of a *Besm* word on pp. 141–143 contains three errors. In spite of being, by computer standards, a rather old account and having the shortcomings described above, this is a book to be studied by those interested in the mechanism of automatic programming.

R. J. ORD SMITH

CONFLUENT HYPERGEOMETRIC FUNCTIONS

Confluent Hypergeometric Functions
By Dr. L. J. Slater. Pp. ix+247. (Cambridge: At the University Press, 1960.) 65*s*. net.

THIS is the first book in English to be devoted entirely to confluent hypergeometric functions. There are two predecessors in other languages, "Die konfluente hypergeometrische Funktion" by H. Buchholz, and "Funzioni Ipergeometriche Confluenti" by F. G. Tricomi, but this book is no mere copy of its predecessors.

The general plan of the work is reminiscent of G. N. Watson's well-known "Treatise on the Theory of Bessel Functions". The first part gives the main properties of the confluent hypergeometric functions and the Whittaker functions, and the second part consists of tables—the most complete so far published—which were computed by the author on the electronic calculator *Edsac* 1 in the University Mathematical Laboratory, Cambridge.

The first three chapters are concerned with differential equations and differential and integral properties of the functions. Chapter 4 is devoted to asymptotic expansions; this is a long chapter as the theme "has been treated in great detail because it seems to cause most difficulty to students of the subject". To me this is a most impressive chapter, and I imagine that it will contain enough to meet the needs of most mathematical physicists.

Chapter 5 is given over to related differential equations and particular cases, while Chapter 6 gives the descriptive properties of the functions, such as the distribution of the zeros, expansions for the zeros, and notes on the tabulation of the zeros. There are also notes on the numerical evaluation of Kummer's function.

The second part of the work consists of tables, running to about 120 pages, giving the smallest positive zeros of Kummer's function, ${}_1F_1(a; b; x)$, and the values of this function over those ranges most useful to the computer. Since confluent functions contain one parameter more than Bessel functions, it is natural that the properties of the functions should be correspondingly less in number, and it is also natural for the tables of the functions to be much longer and more complicated in form.

This is an impressive work which contains many important contributions by the author herself, and the printing is of the high standard that one expects from the Cambridge University Press. The book should certainly be the standard book on the subject in English for many years to come, and it will be indispensable to those mathematical physicists who meet these functions in the course of their researches.

W. N. BAILEY

DENDRITIC GROWTH OF CRYSTALS

Dendritic Crystallization
By D. D. Saratovkin. Translated from the Russian by Dr. J. E. S. Bradley. Second edition, revised and enlarged. Pp. iv+126. New York: Consultants Bureau, Inc.; London: Chapman and Hall, Ltd., 1959.) 6 dollars; 50*s*. net.

THE growth of crystals is a subject of great theoretical interest and practical importance. The process is the building of a periodic three-dimensional pattern of atoms which in crystals, such as diamond or quartz, is simply a giant molecule the size of which is limited only by that of the crystal. Internally, a perfect crystal would have a regular arrangement of atoms, and its external form would be a convex polyhedron with plane faces. In fact, real crystals not only show departures from regular internal structure but also often develop shapes far removed from simple, compact, polyhedral ones. Departures from regular internal structure are known to have considerable effects on the physical and chemical properties of crystals, and the external form developed by a growing crystal is also of great importance. The repeated branching leading to fern-like growths, of which the snowflake is a well-known example, can take place not only if a crystal is growing from a solvent or vapour but also when a melt is cooled. A dendritic structure may first form and the spaces between the branches are then filled in when the remainder of the melt solidifies. Dendritic crystallization is often encountered in metallic systems.

After briefly classifying the various types of crystal growth, the author describes observations on dendrites made some ninety years ago by D. K. Chernov, described as "the famous Russian metallurgist, founder of the modern theory of metal crystallization". This section is followed by a review of existing (Russian) theories of dendritic crystallization, by

Mortimer uses the terms
olithic for want of better
necessarily any cultural
named cultures in western

Europe. Pigmy industries in India do not necessarily denote cultures Mesolithic in time; as Sir Mortimer mentions later on, some of them occur with much more recent cultures.

The Indus civilization has been described so often that one might wonder whether there is much more to be said. This fact presents no problem to Sir Mortimer; his chapter in this volume gives shortly all the really relevant facts and paints a splendid picture of this brilliant culture which grew up by the northern river. But the Indus civilization should not blind us to developments which took place about the same time and somewhat later both in the Ganges valley and in Central India. Much has still to be learnt, especially about the former, but work has been undertaken of recent years by a number of investigators. In this connexion it is somewhat surprising that there is no mention of the many painted rock-shelters in the Central Provinces, which have been known for a long time and studied by Col. Gordon. As they seem to be associated with a pigmy tool-making culture in the process of learning to use pottery they are of some interest. Incidentally, there are some interesting rock carvings in the Indus valley which might have been worthy of a mention, though their date is, to say the least of it, doubtful.

The south Indian megaliths next come under review. Once again no connexion with our megalithic structures need be stipulated, though certain structural similarities, even the port-hole entrances, can be noted. But the date of the Indian examples is considered to be late—c. 300 B.C. A final chapter entitled "Ashoka" concludes the volume. This great emperor, who may have had Selucid blood in his veins, carries the story down to the period of Alexander the Great and so provides a fitting ending to the prehistory of India.

Sir Mortimer Wheeler's book gives the reader one of the best short accounts of prehistoric times in that sub-continent. Civilizations grew up early in those regions, and it is a humbling thought to recall the unsophisticated kind of life being led in western Europe at a time when the civilization of Mohenjo-daro was in full swing in the Indus valley.

M. C. Burkitt

XENOBIOCHEMISTRY

Detoxication Mechanisms

The Metabolism and Detoxication of Drugs, Toxic Substances and other Organic Compounds. By Prof. R. Tecwyn Williams. Second edition, revised and enlarged. Pp. x+796. (London: Chapman and Hall, Ltd., 1959.) 126s. net.

THE second edition of the book by Prof. R. Tecwyn Williams on metabolism of drugs and other organic compounds which are usually foreign to the body has been eagerly awaited, and it should be of great value to investigators in many fields. Since the first edition appeared in 1947 not only many new facts and details of metabolic changes have been discovered but also the general hypotheses of the processes have changed considerably. With the development of civilization, synthetic organic compounds are being widely used as poison gases, rubber additives, pesticides, preservatives, food flavours, contraceptives, cosmetics, as well as drugs and detergents. In order to know whether these are likely to present a toxic hazard to man and in some cases to understand the mechanism of action, knowledge of the metabolic processes which the compounds undergo is of value.

The author explains that the short title of "Detoxication Mechanisms" has been retained, although some of the processes considered lead to the production of substances with increased rather than reduced toxicity. He suggests that the subject might be called 'xenobiochemistry' (*xenos* = strange or foreign).

Since the first edition appeared the techniques for the study of metabolism have changed enormously. The use of such aids as that of labelled compounds (particularly with carbon-14 or sulphur-35), of chromatography on columns or paper or as gas chromatography, of counter-current distribution, of electrophoresis, of spectrofluorimetry, of increased use of ultra-violet and infra-red spectroscopy and of high-speed centrifugation have increased the resources and complicated the investigations of these metabolic processes. The use of modern methods has shown these processes to be much more varied and complex than was thought twelve years ago. Most of the changes which foreign substances undergo in the mammalian body lead to increase in solubility in water and generally to the formation of ionized compounds which can be excreted in the urine or bile. The development of the ability to convert foreign compounds into derivatives which could be easily excreted was essential for animals to live on dry land. Fishes and some other aquatic animals do not possess many of the enzymes which change insoluble unionized toxic compounds into ionized harmless derivatives.

Prof. R. T. Williams is to be congratulated and thanked for his service in collecting, collating and presenting the great amount of material. Among many facts there appear to be few errors. [One on p. 193 is the statement that such a compound as 1 : 2-dihydro-1 : 2-dihydroxybenzene "is at present unknown" is probably due to the long delay in publication.] The book is well produced; but it is a pity that the publication should take two and a half years and that the cost is so high. I hope that a third edition will be available; but the labour which would be involved in its preparation is increasing rapidly.

E. BOYLAND

CORAL STRUCTURES AND CLASSIFICATION

Contribution à la Systématique des Madréporaires Fossiles

Par James Alloiteau. Tome 1: Texte. Pp. 462. Tome 2: Planches. 286 figures + 20 planches. (Paris: Centre National de la Recherche Scientifique, 1957.) 4,500 francs.

THIS is a work of importance to all concerned with the structure and classification of corals whether Recent or fossil. It has been known for several years that this thesis was awaiting publication, and some of its conclusions had already been incorporated in other works by Alloiteau and his students, notably in his section on Coelenterata in "Traité de Paléontologie", tome 1, edited by J. Piveteau (1952). But this does not detract from its importance.

The author sets out to found a classification of the hexacorals based on his investigations of the microstructure and histology of the skeletal parts of many genera and species. Some research along these lines had been carried out in the past by von Koch, Pratz, Ogilvie and others, and the classification used by Vaughan and Wells (1943) and by Wells (1956) embodied the nature of the microstructure. Alloiteau, however, gives far greater importance to it than did any of the previous workers, and arrives at classificatory conclusions which in many cases are very different from those generally accepted. Many well-known genera are split, and a large number of new ones is introduced; sometimes this is justified, but in other cases it is doubtful. There are also new suborders and families, in addition to others Alloiteau had already introduced in 1952, but many will probably be rejected by other systematists.

The author tackles the difficult problems of the relationship of some of the hexacorals to the Palaeozoic Rugosa. Thus the Amphiastraeidae of Ogilvie, which Alloiteau has raised to the position of a suborder, are considered to be derived from the Lonsdaleiidae of the Carboniferous, and the ancestors of the Turbinoliidae and Caryophylliidae are to be sought among at least four families of the rugose corals. There is a long section, too, on the evolution of the various parts of the skeleton of the Madreporaria, and the author records many useful observations and comparisons of structures in Palaeozoic and later corals.

Alloiteau is led to unusual views concerning *Heliopora* (the blue coral), *Polytremacis* and the Heliolitidae. Not many will agree with his denial of any relationship between the first two, and with his erection of a new suborder of Actinanthida (= Zoantharia) to include *Polytremacis* and certain madreporarian genera. *Heliopora* itself remains, for Alloiteau, an isolated genus among the Anthozoa, with characters both of the Alcyonaria and the Actinanthida, but its histological structure is nearer to that of the latter. The Heliolitidae are also considered as Madreporaria and to have evolved from the Silurian through the Jurassic Stylinida into *Stylophora* of the Tertiary. He places a new Upper Cretaceous genus *Selidolithus* in the same family as the Silurian genus *Pycnolithus*.

One of the best services that Alloiteau renders is his re-description of the type species of several genera, based either on the original material, or, where that is lost, on neotypes. He tries to follow the International Rules of Zoological Nomenclature, but in the case of the type species of *Heliopora* he does not arrive at the same conclusion as other law-abiding systematists. Nor is his retention of the name *Cunnolites*, which he resurrected in 1952 for *Cyclolites*, in accordance with sound taxonomic principles.

The work is not easy to assimilate and would have benefited from careful revision of the typescript. The figure illustrations are beautifully drawn, as is usual in Alloiteau's papers, but many of the plate-figures are poor, and one (Plate 15, figure 9) lacks explanation. There are several mis-spellings, including that of the genus *Extastraea* twice in headings on p. 215. The index omits references to at least seventeen important genera, including eight new ones, namely, *Dermosmiliopsis* (invalid in 1952, and now apparently only on Plate 4, figure 6), *Dichocaeniopsis* (sic—p. 264), *Haimeicyclus* (p. 105, footnote), *Heterohelia* (p. 303), *Paradichocaenia* (sic—p. 277), *Rhabdopsammia* (apparently only on Plate 4, figure 5), *Tabulocaenia* (sic—p. 187), and *Thecoseriopsis* (invalid in 1952 and now apparently only on Plate 9, figure 2).

As with most American publications, the price is very high, and therefore calls for comment. The book should obviously find its greatest use in the hands of young research workers in this field and of advanced undergraduates, who would undoubtedly obtain valuable insight and stimulation from the better review articles. But the price is well beyond their pockets; even heads of university departments will no doubt have to balance carefully the virtues of this book against the more tangible advantages of the equally expensive encyclopædias which are now appearing and which cover this subject completely.

L. J. Audus

RELIGION AND SOCIAL STRUCTURE

Oedipus and Job in West African Religion

By Prof. Meyer Fortes. Pp. 81. (Cambridge: At the University Press, 1959.) 10s. 6d. net.

THIS book is an expanded version of the Frazer Lecture for 1956. In it Prof. Fortes gives a very interesting interpretation of the religious ideas of the Tallensi, and other West African societies, in terms of the Œdipus and Job stories, and tries to show that these ideas are reflexions of the social structure.

The aspect of the Œdipus story used here is not that made familiar by Freud: instead, it is the idea that some people are born with an evil destiny, and are never properly accepted by society; this is not of their choosing and they can do nothing about it. The interpretation of Job is that he was being tested and disciplined by a just God; Job was saved not by good works, but by recognizing his error in placing himself on a level with God.

Prof. Fortes finds parallels to these stories in West African religion, and he gives a detailed account of the ideas of the Tallensi. A parallel to Œdipus is found in their idea of good and evil predestiny: this makes sense for them of the fact that some people have persistent bad luck, fail to bear children, die of mysterious diseases, and so forth. It is believed that the ancestors are responsible, since each person is thought to be the ward of an ancestor. However, unlike the Œdipus story, it is possible to overcome an evil destiny by ritual offerings and service to the ancestors, and who Fortes sees as equivalent to Job's just God. One can be saved only by obedience and subservience to the ancestors.

A further part of the thesis of this book is that "the Tallensi have an ancestor cult because the social structure demands it" (p. 66). It is pointed out that there are different possible religious interpretations of good and bad fortune—the Azande blame it on witchcraft operated by living people, for example. The ancestor cult is a symbolic representation of the parents, resulting from the close discipline, authority and affection of the parent–child relationship.

Two general comments may be made about the book. In the first place, while the parallels drawn with European stories are interesting, and to some extent convincing, it is not made clear how the exposition or explanation of African religion is assisted by making them. Secondly, for a rigorous demonstration of the thesis that these religious ideas are a product of the social structure, a cross-cultural study would be required showing that ancestor cults are regularly associated with a certain quality of parent–child relations.

Michael Argyle

Demography

By Peter R. Cox. Third edition. Pp. xiv + 346. (Cambridge: At the University Press, 1959. Published for the Institute of Actuaries and the Faculty of Actuaries.) 25*s*. net.

In the third edition of his text-book Mr. Cox has taken the opportunity of including the "Addendum" to the previous edition in his text, and of fully re-writing the text, adding in particular references to populations outside Britain. Apart from these and other minor changes in arrangement, however, the coverage remains as in the previous two editions: a text, primarily on the methods of studying population written with the needs of actuarial students principally in mind. Its main weakness as a general text on demography is imposed by the limitations of the actuarial syllabus: namely, the fact that life tables are treated in a separate publication on mortality and other investigations. A book on demography, in which life-table techniques are only treated in passing is like Hamlet without the prince, and it is to be hoped that Mr. Cox will be able to persuade his editorial committee, when he brings out further editions, to include material on life-table techniques, thus making his book much more useful for those outside the actuarial profession.

E. Grebenik

The Instrument Manual

Third edition. Pp. viii + 742. (London: United Trade Press, Ltd., 1960.) 105*s*.

Everyone who is directly concerned with instrument technology will need to have a copy of "The Instrument Manual" for immediate consultation and reference, but it contains so much that is of interest and value to engineers and physicists in general, particularly those active in industrial, research or teaching laboratories, that every laboratory library ought to possess at least one copy. Its price is moderate when compared with that of modern text-books and similar reference books. The format is good, the diagrams are bold and clear, and the tables and graphs are well set out for easy reading rather than economy of space. Throughout, adequate reference is made to all relevant British Standard specifications.

During the seven years since the publication of the second edition great strides have been made in British instrument development, particularly in the fields of automation and nucleonics. Nevertheless, much basic instrumentation, well proved in practice, has remained unchanged. In the present third edition, therefore, while the general scheme follows that of the second edition, the section on navigational instruments has been omitted and replaced by one on analogue computers; discussion on digital computers has been deliberately omitted; the original optical section has been dispersed, with microscopy given a section to itself and the analytical pattern of optical instruments included in the section "Analytical Instruments" which has parts devoted to polarography, gas analysis, and moisture content.

The section on nucleonic instrumentation is divided into reactor-control instrumentation, health instrumentation, laboratory instrumentation, and industrial instrumentation. In all, there are twenty-eight sections, the last two being devoted to an alphabetical list of manufacturers, their names, addresses and telephone numbers, and a list of United Kingdom organizations interested in instrumentation. In each section the basic concepts are carefully described, and the relevant theory applicable to the various types of instruments illustrated and discussed is outlined. The text is naturally limited to measurement and instrumentation, but in dealing with physical properties like viscosity and temperature, the discussion is often more up to date and more clearly expressed than in many a modern physics text-book. Appended to each section is a short bibliography and a buyers' guide.

S. Weintroub

Genetics, Radiobiology and Radiology Proceedings, Mid-Western Conference

Edited by Dr. Wendell G. Scott and Dr. Titus Evans. Pp. xv + 149. (Oxford: Blackwell Scientific Publications; Springfield, Ill.: Charles C. Thomas, 1959.) 42*s*. net.

This conference was one of three convened in various parts of the United States by the National Research Council–National Academy of Sciences to provide a forum in which radiologists and geneticists could discuss the problem of the genetical hazards from radiation used for diagnostic processes.

The full proceedings of the two sessions of the conference are contained in this book.

The first session was devoted to the "Fundamentals of Radiation Genetics". It contained papers of varying standards, some of which were of an introductory nature. There were good papers by Russell and by Crow, on "Radiation Damage in Mammals" and "Population Aspects" respectively.

The second session contains papers on the problem of reducing radiation genetic effects in the medical use of X-rays. The most important papers in this section are those on gonadal radiation resulting from various diagnostic radiological proceedings, and reduction of radiation in obstetrical radiology. The standards of the other papers are lower.

The book would have been greatly improved if the papers had been edited to stress the important points and to cut out repetition. Most of the papers contain no references. However, radiologists and radiographers may find it useful to read this book, which brings genetics and radiology together within one cover.

Lorna J. Lilly

The Year Book of the Royal Society of London, 1960

Pp. 302. (No. 64.) (London: The Royal Society, 1960.) 21*s*.

The Yearbook of the Royal Society of London, 1960, contains a list of Fellows and foreign members of the Society with their current appointments and addresses, corrected to January 1. Also included is the membership of the Royal Society committees and committees formed jointly with other bodies. The Royal Society research appointments are listed, and scientific reports of the work undertaken by Professors, Fellows and Students are included. The regulations governing these appointments are also given. To complete the volume, the statutes, the annual report of Council, medal awards and lectures, funds and a summary of the accounts are included. The Yearbook maintains its usual form and high standard of presentation. The delay in publication can, no doubt, be explained by the printing strike; but it may be regretted that it was not delayed a little longer so that it could include the 1960 election of new Fellows. However, as is the habitual practice, these have since been provided in a supplement.

or differences, still claim
g evolutionary novelties,
not produce the complex,
us changes, functional at

every stage, that are needed for such elaborate organs as a bird's wing or the human eye. The postulated synchrony in such adaptations may not, however, be needed. For example, de Beer showed that the wing of the bird-reptile *Archaeopteryx*, though fully feathered, lacked muscles to flap it; it was evidently used for gliding. Hence part of the elaborate mechanism of bird-flight was fully evolved before another part was started, and such 'mosaic evolution' has probably been widespread. Again, in different types of animals alive to-day, one can find many intermediate conditions between a mere light-sensitive area in the skin and the elaborate focusing eye of a man or octopus, all of these stages being functional and well adapted for the animals possessing them.

It was also argued that elaborate adaptations could never have been produced 'by chance'; but this is a misconception, for selection is the reverse of chance. Moreover, the alternative to natural selection, a Life Force or Holistic Urge, solves nothing; it is merely a name for what is not understood, and introduces an unverifiable pseudo-mystical entity into the domain of science, where such concepts are inappropriate. Anyway, it implies that the hereditary changes, the mutations, are directive, whereas in fact they are random, and it is their subsequent selection that determines the directions (not direction) of evolution. It is true that natural selection has so far been proved only for small changes; but it is a reasonable inference that it has operated to produce the big evolutionary changes of the past, very gradually, and functionally at every stage.

A century ago, the one popular argument for the existence of God was Paley's, that animal adaptations are so marvellous that they must have had a Designer. Darwin showed, instead, that they came about by natural means, not as already explained by chance, but by natural causes or laws. Theologians to-day reject Paley's argument based on particular adaptations. There is, of course, a much stronger philosophical argument from design, that a universe governed by natural causes or laws must have been divinely instituted; but acceptance of the biological theory of evolution makes this argument neither weaker nor stronger than before.

Darwin's views were also feared as implying a strictly mechanistic or deterministic view of the origin of living things, including man. But all that has been demonstrated is a particular historical sequence of animals, within which only some of the many possibilities have been realized. The relationship of such a sequence to determinism, and the bearings of determinism on Christian belief, are extremely complex metaphysical questions on which, once again, particular theories of biology can throw no special light. Hence Christians were wrong to attack Darwin's theory on the grounds that it meant that evolution was 'blind', since so far as the biological evidence is concerned, they are as free to hold that the natural means of evolution are a divine creation as atheists are to deny this.

---

* Substance of
Institution on Ma

Discourse delivered at the Royal

Natural selection was also rejected because it involves a huge annual death-rate, and to humanists like Bernard Shaw it seemed inconceivable that such terrible means could have led to man, with his sense of beauty, goodness and truth. The same grounds have led various Christians to assert that the natural creation must have been distorted by a spirit of evil; but this is another instance of argument from particular designs in Nature. A truer attitude for the Christian, surely, was that of Dr. Pusey: "What are we, that we should object to any mode of creation, as unbefitting our Creator?"

At the present time, nearly all evolutionary biologists fully accept natural selection as the main means of animal evolution, but various other writers, both Christian and agnostic, have continued to advocate Creative Evolution. Prof. M. Polanyi, for example, conceiving the animal world as "a continuous ascending evolutionary achievement", wrote that "the action of the ordering principle underlying such a persistent creative trend is necessarily overlooked or denied by the theory of natural selection, since it cannot be accounted for in terms of mutation plus natural selection", and the similar views of Teilhard de Chardin, have been acclaimed as the book of the year, if not of the century. So one is led to ask why views so unacceptable to biological specialists should be so widely accepted by others. The reason may, I suggest, be different for Christians and agnostics: that Christians, still misunderstanding the metaphysical implications of natural selection, want to see evidence for theistic design in Nature, while agnostics feel that Creative Evolution may provide the justification for human values which natural selection is incapable of doing.

In answer to the Christian difficulty I may quote the Oxford theologian Dr. E. L. Mascall: "We need not worry that science describes the course of evolution in impersonal concepts; that is its job. What is reprehensible is any attempt to treat the scientific account as if it were a metaphysical one". Again "Perhaps some modern apologists have gone badly astray in looking for direct evidence of God's design in the evolutionary process. The truth may be that God is able to achieve his ends without that sort of design". He added that, "for Christian theism, no events are fortuitous in the ultimate metaphysical sense".

The agnostic objection, that natural selection cannot justify human values, requires longer treatment. Especially since the finding of fossil men and ape-men in Java, Peking and South Africa no one can seriously doubt that man's body evolved by natural means. In addition, so much innate or instinctive behaviour has now been demonstrated in man, and so much learning and social behaviour in animals, that we may reasonably conclude that at least much of man's behaviour is a product of natural evolution. But what of man's special faculties, in particular his moral conduct? Herbert Spencer postulated that good conduct was the more evolved conduct, while theories of "evolutionary ethics" have also been advocated by modern biologists such as Waddington and Sir Julian Huxley, Waddington saying in effect that the direction of evolution is good.

Two problems are involved, the origins and the value of morality. Many of man's social attitudes, including his desire to help his fellows, are so deep-seated, and find such obvious parallels in other social mammals, such as apes or dogs, that partly innate tendencies would seem to be involved, which have presumably been subject to a natural means of selection. This might be through selection of the tribe, pack or other social unit; for social behaviour must, on balance, increase the chances of survival of the group and hence of the individuals composing it. Further, there is some reason for suggesting that at least part of what we now call evil behaviour was behaviour which contributed to individual survival in the past but which came to be selected against after men started to live in groups. However, all that has been said so far refers to social behaviour, not to moral conduct, and between them there is a great difference. The worker ant is social, but not moral, while the dog is social and we hesitate about a moral faculty, but probably decide against it.

Moral conduct is involved only when a genuine choice between actions is possible. We hold that man has free-will, through introspection and through what others tell us, while on the legal plane we accept as valid the distinction between a person being responsible or irresponsible for his actions even though it may be hard to decide in certain cases. But no test or experiment can be devised to determine whether another animal has free-will. Sometimes we may see it delay before acting, but then the biologist may say that it was subject to conflicting drives, one of which proved strongest. (This type of analysis is itself open to criticism, but the important point is that all biological interpretations leave out the possibility of the animal possessing free-will.)

Free-will depends in turn on self-awareness, which likewise we have no scientific means of demonstrating in other animals. We sometimes speak of a pet dog being pleased, or guilty, implying self-awareness, but we should strictly have said "as if pleased, or guilty", and we cannot pass beyond "as if". This is not necessarily to deny that other animals have self-awareness, but merely to say that we have no means of telling; and unless animals have free-will and self-awareness, we can scarcely speak of their having moral conduct. The gap in knowledge seems unbridgeable. This still allows the evolutionist to assert that man evolved these peculiar faculties gradually from rudiments in other animals, but it does not allow him any direct evidence for this, and it allows others to claim that, so far as free-will, self-awareness and moral conduct are concerned, there is an absolute difference between man and all other animals. (The growth from unconscious behaviour to self-awareness in the human young does not necessarily afford a parallel with the evolutionary development of the species, since the baby's self-awareness must wait on the physical maturation of the brain.)

It is even harder to find a natural basis for the value than the origin of moral conduct. The essential difficulty was put long ago by T. H. Huxley, and many hold that it has never been answered. "Cosmic evolution", he wrote, "may teach us how the good and evil tendencies of man may have come about; but, in itself, it is incompetent to furnish any better reason why what we call good is preferable to what we call evil than we had before." Thus even if good behaviour is simply that which has contributed to the survival of the group, this provides no compelling reason why we ought to be good now, nor does it sufficiently explain why, when a man knows what is right, he so often chooses what he knows to be wrong. I think it fair to say that all the attempts so far made to explain moral values on evolutionary grounds have broken down, and many claim that such attempts

of evolutionary continuity

from ape to man so properly stressed by T. H. Huxley is broken, though on a spiritual rather than a natural plane. The agnostic, rejecting such views as myth, seems equally free to hold that man evolved gradually in every respect from other animals and wholly by natural means, acknowledging that not enough is yet known to determine the origin and value of these specially human faculties; though others might argue that this view provides too weak a basis for good conduct. There are also Christians who postulate a wholly gradual evolution of man from animals, some of them supposing that animals have an interior life, if not a soul, and others acknowledging ignorance as to the means involved. There are also atheists who consider moral values inexplicable in terms of natural evolution, leaving their basis unresolved. Each of these views involves unbridged, and perhaps unbridgeable, gaps in knowledge, but it seems much better to admit these freely than to seek to bring all into a deceptive unity by the application of a theory outside its proper sphere: such as Creative Evolution, which brings a pseudo-mystical concept into natural evolution, or Evolutionary Ethics, which interpret values in terms of natural survival. Enough has been said, I hope, to justify my statement that the conflict between Darwinism and religious belief has not been settled. Yet we can scarcely afford to leave the settlement entirely to posterity, since we need a basis for our lives and actions now.

beyond.

l seventeenth centuries,
r countries had formed
e promotion of natural
se societies or academies
had but a short life or found their work interrupted for a considerable number of years by circumstances beyond their control. The Royal Society was the first association of scientists to study the "New Philosophy" for an uninterrupted period of three hundred years. Only one year after its foundation during the reign of Charles II (who granted its Royal Charter in 1662) a similar body, the Académie des Sciences, was founded in France. However, in contrast to the relations of the English Crown to the Royal Society, the French King and his ministers exerted considerable influence on the programme of research and studies of the Académie des Sciences.

The motto of the Royal Society, "Nullius in Verba", demonstrates clearly how it tried to realize the ideals of Francis Bacon and his "House of Salomon", and its message of truly independent scientific research was understood by many on the Continent and abroad. Similar bodies were founded with State aid during the eighteenth century in Brussels (1772), Copenhagen (1742), Berlin (1700), Göttingen (1751), Munich (1795), Turin (1783), Venice (1771), St. Petersburg (Leningrad) (1724), Madrid (1713), Prague (1700), Boston (1780) and Stockholm (1786), but none of them achieved that independence of Government control which characterizes the work of the Royal Society of London. The subtle influence of the Royal Society is none the less evident in the charters of most of these bodies.

However, the Royal Society's activities have had much more tangible influences on foreign research. Like most seventeenth-century learned bodies, the Royal Society started a collection of foreign animals, plants, minerals and instruments, the nucleus of which was formed by the "collection of rarities", bought from Mr. Hubbard for the sum of £100 in 1666. Sprat, in his "History of the Royal Society", mentions how at a very early date it started to "collect and send abroad inquiries" about the East Indies, China, St. Helena, Teneriffe, "Ginny, Barbary and Morocco", Spain, and Portugal, Turkey, France, Italy, Germany, Hungary, Transylvania, Poland, Sweden, Iceland and Greenland. As an example of such contacts abroad, from whom data on the local flora, fauna and geology were collected, he prints the full text of an "Inquiry" sent by Sir Robert Murray to Sir Philiberto Vernatti, "resident in Batavia in Java Minor".

More lasting contacts were undoubtedly established by the Royal Society's decision to make possible the printing of its Fellows' papers and other memoirs of scientific investigations. On March 6, 1665, Henry Oldenburg, secretary of the Royal Society and one of the most prolific correspondents of the century, published the first number of the "Philosophical Transactions: giving some Account of the present Undertakings, Studies and Labours of the Ingenious in many considerable Parts of the World". The very sub-title of this first scientific periodical shows that it would not be confined to the publication of memoirs submitted by Fellows of the Royal Society. Its columns were thrown open to any scientist, wherever he lived, provided his work came up to certain standards.

This step was a most significant one for science in general. Up to that date, the students of the 'New Philosophy' had been able to communicate their results and their theories to a local circle of friends only. Some managed to have them printed in pamphlet or book form, but it was virtually impossible to submit them for discussion to an international forum of critical fellow-scientists. Hence such data and theories took a very long time to spread. Oldenburg's effort solved the most important problem of communication of the day. A memoir published in the *Philosophical Transactions* could now produce reactions within a matter of months, where earlier workers had had to wait a generation before their results were absorbed and seriously discussed by foreign fellow-scientists.

A striking example of this feature of the *Philosophical Transactions* can be found in the correspondence of Anthoni van Leeuwenhoek published in the volumes from 1673 onwards. Van Leeuwenhoek was a native of Delft and one of the pioneers in the world hidden from the naked eye but penetrated by the use of lenses. With his 'microscopes' (in reality single lenses mounted between two small silver plates) he magnified the objects studied 200–250 times. As he did not speak or write English, the letters recording his adventures in this microcosmos were translated with the help of his fellow-townsman, the physician Reinier de Graaf, who was already corresponding with the Royal Society, and other friends. For nearly fifty years, most of the 280 letters written by him as well as a number of the 550 microscopes which he made, with objects mounted for observation, went to the Royal Society. The secretary published some 124 letters by van Leeuwenhoek during the fifty years of contact which the Royal Society had with him, as well as the observations by Robert Hooke, who often tried to repeat and equal the results of van Leeuwenhoek. However, Hooke possessed only a compound microscope, consisting of a very small plano-convex object glass and a large plano-convex eye-piece, which magnified his objects only about 40 times. This difference in their 'penetration' of the microcosmos led to violent accusations of misrepresentations on both sides; but from the discussions and the part taken by other scientists very valuable results ensued for microbiology and other fields of science.

The publication of his letters in the *Philosophical Transactions* soon made van Leeuwenhoek famous, and a correspondence with other scientists or amateurs ensued. Among his correspondents we find not only all the famous men in the United Provinces but also the Elector Palatine, the Landgrave of Hesse-Cassel, the chief librarian of Cosimo III, Duke of Tuscany, Leibniz and von Tschirnhaus. Even princes came to see him at his Delft home.

This is but a typical example of the benefits which many a Continental scientist derived from having his papers printed through the good offices of the Royal Society. In certain cases the Royal Society also had longer memoirs and books printed. In the early period, when funds were not always adequate, the Royal Society could not always publish these works itself and merely sanctioned their publication. In this way Newton's famous "Principia" received the Society's 'imprimatur' from the then president, Samuel Pepys, to be printed at the expense of Edmond Halley, the astronomer. However, this sponsoring of larger publications was not restricted to the work of English subjects only. As early as 1669 the Society published a book on the silkworm by the famous Italian biologist Marcello Malpighi, who was in constant correspondence with Robert Hooke. Six years later, in 1675, another book by Malpighi, on plant anatomy, was published by the Royal Society, which also helped to print his work posthumously in 1697. Among these early publications we also find two volumes on the "New Digester or Softener of Bones" (1681 and 1687), invented by the French physician, Denis Papin, who during certain periods of his life was the assistant of Huygens and of Boyle. These two publications deal with the ancestor of the modern 'pressure-cooker'.

Even during the early eighteenth century when the Society's scientific activities were at their lowest ebb, both the *Philosophical Transactions* and the series of publications maintained the high standard which still characterizes them to this very day.

The third way of promoting science abroad was the election of foreign scientists as Fellows. Not only was Anthoni van Leeuwenhoek thus rewarded in 1680, but in the earliest registers of Fellows we find the names of the Dutch physician, Christiaan Huygens (1663), the Frenchman Samuel Sorbière (1663),

In Banks's days, joint ventures with foreign scientific bodies were already common features in the Royal Society's programme, quite apart from its own naturalist and astronomical expeditions. Thus in 1785, King George III authorized a grant needed for a triangulation from Greenwich, which connected across the Channel with similar French triangulations from the Observatoire Royal. This was but one of the many co-operative ventures which culminated recently in the antarctic expedition in connexion with the International Geophysical Year, when the Royal Society established a station at Halley Bay for various scientific observations. Just after the First World War, the Royal Society took the initiative in re-establishing international co-operation, which resulted in the setting-up of the International Research Council, reconstituted in 1931 as the International Council of Scientific Unions. Through this International Council and through the United Nations Educational, Scientific and Cultural Organization, the Royal Society is now very active in promoting international research and not least in disseminating scientific knowledge, as it has done for centuries. The latter effort culminated in the Scientific Information Conference of 1948, held to establish the proper means of disseminating scientific information in general. Through its numerous committees the Society now co-operates with a variety of international commissions and in various international scientific projects, true to its motto, that research knows no master but is for the benefit of mankind as a whole.

His next important publication[2], with J. L. Smith, refers to work done at Oxford. A subject was shut up in an airtight chamber, with or without a tray of soda-lime to absorb carbon dioxide; or mixtures were breathed from bags. The highest and lowest concentrations breathed were 18·6 per cent carbon dioxide and 6·7 per cent oxygen. Their conclusions as to the physiological effects of these gases, which disagreed completely with those of several contemporaries, are now universally accepted. They also found that water condensed from breath was no more poisonous, when injected into rabbits, than any other distilled water, whereas the contrary had been claimed.

In 1894, he began going down mines to collect air samples, and established the composition of 'black-damp' in which oxygen is deficient, and carbon dioxide in excess. But his main interest was in carbon monoxide, on the effects of which he published a paper[3] in 1895. He found that 0·06 per cent carbon monoxide produced symptoms in mice when added to the air breathed, while 0·2 per cent was fatal. When added to pure oxygen about ten times as much carbon monoxide is needed. He then himself breathed mixtures containing carbon monoxide. He reached 49 per cent saturation of his hæmoglobin, at which point "stopped experiment. Vision dim.

Limbs weak. Had some difficulty in getting up or walking without assistance, movements being very uncertain". When a mouse breathed the same mixture as a man the final results were not very different, but symptoms appeared in about one-twentieth of the time. He at once applied this fact to the detection of carbon monoxide in mines while collecting gas samples from heated coal. He later found that small birds, with their higher gas exchange per gram per minute, reacted still quicker. In the next year he went down three collieries which had recently exploded, took samples of blood from dead men and horses, and concluded that they had died of carbon monoxide poisoning. In the course of this work he developed analytical methods which were later improved.

In 1896, Haldane and Lorrain Smith found that when a man is in equilibrium with a small percentage of carbon monoxide, his blood contains less of this substance than when it is equilibrated with a gas mixture believed to approximate to his alveolar air. Later work with Douglas confirmed this conclusion. His explanation that this is due to oxygen secretion by the lungs has been strongly criticized, but the facts must be explained. They also found that light decomposes carboxyhæmoglobin. He made a number of experiments on hæmoglobin derivatives, giving spectra of several new ones, and making the important discovery[4] that when ferricyanide is added to oxyhæmoglobin the oxygen is given off quantitatively. This was the basis of his subsequent work on oxygen transport. He also[5] described the gas-analysis apparatus which bears his name.

During the last two years of the nineteenth century he was largely occupied with other matters. He took the teaching of physiological chemistry seriously, and was, for example, the first to use Kjehldahl's method of nitrogen estimation in Britain. Among his publications in applied physiology at this time are reports on three colliery explosions, in which he recommended the use of rescue apparatus, after personal experience with one of his own design, on poisoning by lighting gas, and on the air of the London Metropolitan railway, the electrification of which he recommended.

The period 1900–14 was the most productive of his life. In 1900, with Smith[6], he administered about 120 ml. of carbon monoxide in closed-circuit breathing apparatus to 12 men. About 20 per cent of their hæmoglobin combined with this gas, and he thus determined their blood volumes. In the next year[7] he established standards of hæmoglobin for men, women and children, using his well-known pocket hæmoglobinometer; and in 1902, with Barcroft, described a blood gas manometer the subsequent modifications of which by Barcroft, Brodie and Warburg have been very widely used for many purposes.

In 1901 he found that an outbreak of anæmia in Cornish tin mines ascribed to 'bad air' was due to ankylostomiasis, and later, with A. E. Boycott[8], described its course and eradication. During this investigation he became interested in the much more serious disease, miners' phthisis, and with R. A. Thomas[9] proved that it was due to rock dust. It had been attributed to nitrogen peroxide, ladder climbing, and even lack of sunlight. The fact that it is now called pneumoconiosis is sufficient proof that his views have been accepted. He continued work on it for the rest of his life.

In 1905, with J. G. Priestley[10], he published what I think he regarded as his most important single paper, showing that under normal conditions human breathing is so regulated as to keep the percentage of carbon dioxide in the alveolar air almost constant at atmospheric pressure. It was characteristic of Haldane that, before going into compressed air, he verified that the partial pressure remained steady when the density of the air changed, by descending a tin mine and ascending Ben Nevis. With Fitzgerald he established norms for men, women, boys and girls. His work in mines and textile factories prompted a series of experiments in which he showed that the main factors in determining human reaction to heat are wet-bulb temperature, air-flow, and clothing. This work has since been greatly extended by others.

He next investigated diving with A. E. Boycott and G. C. C. Damant, R.N.[11]. His first discovery was that the pumps used by the Navy to send down air to divers leaked atrociously even at four atmospheres. It was believed to be dangerous to ascend or descend at more than 1·5 m./min. The present record is about 60. There is no danger in rapid descent provided the air supply is adequate and the diver can hold his Eustachian tubes open. But Bert had shown that too quick an ascent can lead to the liberation of bubbles of nitrogen which may cause death from embolism, paralysis, pain and other symptoms. Experiments on goats showed that however long they had been kept at a given pressure it was safe to halve it. Simple calculations based on this fact and on the hypothesis that various tissues exchange nitrogen with the blood by simple diffusion at different rates, while the arterial blood is in equilibrium with the alveolar air, allowed the preparation of tables for decompression by stages; and these were tested, first on goats and then on men. In the subsequent fifty-two years these tables have needed very little alteration, though they have been extended to greater depths and longer times.

At this time he was also serving on Royal Commissions on the ventilation of factories, and on mines. Among the measures which he recommended, in the face of much opposition, were the provision of pit-head baths, and means for reversing the ventilation in coal mines. Both have since been made compulsory. A moment's consideration of the results of a fire near the down-cast shaft, when the air stream can be reversed and when it cannot, should make the value of reversal clear.

Meanwhile, in a series of papers, mainly with C. G. Douglas, he worked out the details of the regulation of breathing. Their results are summarized in "Respiration"[12], though a student of physiology may well read the original papers to see how the conclusions were reached. In 1911, with Douglas and two American colleagues, Yandell Henderson and E. C. Schneider, he spent six weeks at the summit of Pike's Peak (14,019 ft.) in the Rocky Mountains. They studied acclimatization, which included changes in the blood volume, increased hæmoglobin production, and a lowering of the plasma bicarbonate which permitted increased breathing. Their further conclusion, that the lungs secrete oxygen into the blood, has been denied by Barcroft and others; but it is not sure that the last word has yet been said about it. In 1912, he published a paper[13] with Douglas and myself on the equilibria between hæmoglobin, oxygen, and carbon monoxide, and the effects of carbon dioxide on them. In 1914, with Christiansen and Douglas[14] he confirmed, and above all quantified, Bohr's observation that the oxygenation of blood drives carbon dioxide out of it.

be produced without any measurable cause. In reality the acidosis is not completely compensated, and the incompleteness is only hidden by the extreme roughness of the method of measurement in comparison with the fineness of the physiological reaction". A corollary of his rejection of vitalism was his disbelief in personal immortality, which he combined with a lively belief in God; his theological views were definite enough to prevent him from joining any religious organization.

Many contemporary physiologists thought in terms of mechanism, and did not see why he was not content with the notion that the mechanisms concerned were very numerous and delicate. They twitted him with making accurate physical and chemical measurements. In this article I have only referred to a few of his analytical methods; for these have often been superseded by more speedy and accurate ones, though sometimes by methods which are more expensive and no more reliable. His answer was as follows. "As a mere physicist or chemist I should never have dreamt of looking for such things as constant dissociation curves or carbon dioxide pressures or hydrogen-ion pressures or chlorine percentages in such liquids as blood; and if I had chanced to find one it would only have appeared as a very unintelligible fact". Even if (as I do not believe) his point of view is fundamentally false, it has great heuristic value.

To take a concrete example, Gemmill and Reeves, in 1933, working on dogs trained to breathe through respiratory valves, showed that the receptors for oxygen want are in the carotid sinus, but those for carbon dioxide excess are elsewhere, probably in the medulla. But Haldane, Meakins and Priestley[14] had found in 1919 that oxygen want mainly increases the frequency of human breathing, while carbon dioxide excess mainly increases its depth. Hence these two stimuli cannot act in summation on the same receptors, a fact ignored by many workers in the interval between the two papers cited. Even if the aim of physiology is regarded as a mere cataloguing of the functions of various organs, a study of the organism as a whole will tell physiologists what to look for.

Haldane's research was based on his beliefs in the unity of organisms as self-sustaining systems, and in the value of accurate measurements. If an organism is seriously damaged it may no longer be capable of self-regulation, and large and easily measurable changes may occur in it. But very great accuracy is often needed to measure the small changes which occur in healthy organisms, and which give the clue to their self-regulation. That is why he preferred to experiment on himself with an accurate apparatus rather than on rabbits with an inaccurate one.

At present biochemists are largely concerned with research which, on a molecular scale, is the equivalent of human and comparative anatomy on a larger scale. This work has been of immense practical value when, as with antibiotics and weed-killers, the desired end could be obtained by killing species *A* while sparing species *B*. It has been of much less value when, as in the therapy of cancer and psychosis, we desire to restore normal self-regulation within an organism.

I can perhaps best illustrate the value of my father's approach by citing the work of the two living biologists whose approach seems to me closest to his, though I doubt if they were directly influenced by him. Karl von Frisch discovered the system by which bees communicate the direction and distance of a food source. He observed them under almost normal conditions, and investigated quantitatively the correspondence between the dance of a bee, the voyage which it had made, and those made by other bees which responded to the dance. He discovered that bees respond to the polarization of light. But this was first inferred from their behaviour under natural conditions. It was not discovered by measuring the response of isolated organs to physically well-defined stimuli. Jacques Monod and his colleagues studied the synthesis of β-galactosidase by bacteria under a variety of external and internal conditions. The results give no direct information as to the process of protein synthesis, such as are given by studies of enzymes which phosphorylate amino-acids. But they tell us enough about its regulation to offer at least a possible partial explanation of why different cells in the same organism make different proteins. The by-products of this work, such as Cohen and Cowie's production of bacteria in all the proteins of which selenomethionine completely replaces methionine, are as important as they are unexpected.

Haldane's approach to biology is not the only fruitful one. But I think that in most fields of biology it is not being applied as fully as it should be if research is to be as efficient as possible. However that may be, a study of his work and thought can still, I believe, be of great value in suggesting topics, and above all, methods, of research to biologists to-day.

NEW LABORATORY OF THE DEPARTMENT OF METALLURGY, UNIVERSITY OF OXFORD

MR. ISAAC WOLFSON officially opened the new Laboratory of the University Department of Metallurgy at Oxford on May 31. The building (Fig. 1) is the first section of the new science area of the Keble Road triangle, and it was designed by Mr. George Buzuk, of Messrs. Murray, Ward and Partners.

In a speech welcoming the visitors, Prof. W. Hume-Rothery, head of the Department, outlined the history of metallurgy in Oxford and expressed the Department's appreciation of the support received from many sources, and from Mr. Wolfson, whose endowment of the chair of metallurgy had supplied the crowning touch to the establishment of the subject.

Mr. Wolfson spoke of the increasing dependence of many branches of modern science, and of industry, on research in metallurgy. The small Oxford school, in spite of the scale on which it has been compelled to work, has played a prominent part in the scientific study and understanding of the subject. In the new building this work will continue, and the introduction of the teaching course will help to provide more of the trained metallurgists which Britain so urgently needs.

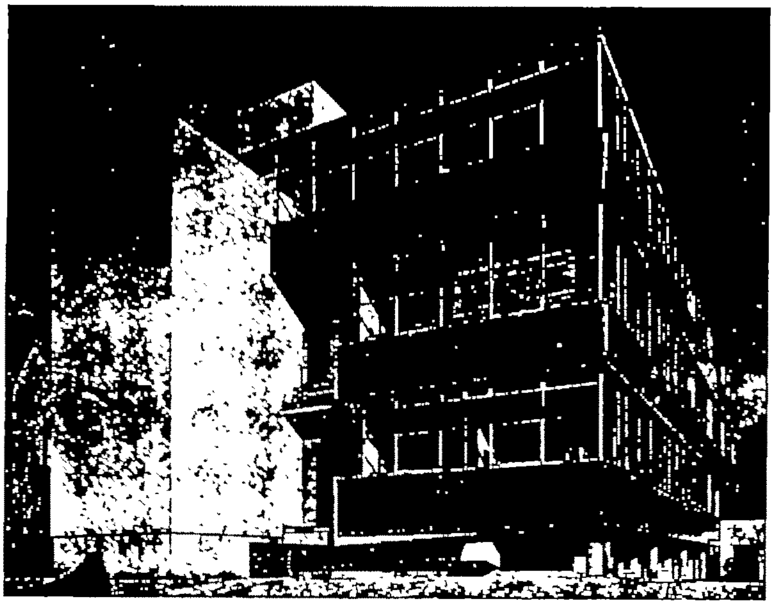

Fig. 1. Department of Metallurgy, University of Oxford. By courtesy of *The Architect and Building News*

The Vice-Chancellor of the University of Oxford, Mr. T. S. R. Boase, paid a tribute to Mr. Wolfson and his Trustees, who are one of those foundations that play such an immense part in the expansion of university life to-day. He described the building as the first unit of what will undoubtedly become the great centre of twentieth-century architecture in the Oxford of the future.

After the opening ceremony, the laboratories were open to inspection by the visitors, and the apparatus and results of some of the research in progress were displayed.

The new building has four floors: in the basement there is the main

Pressed Steel Company enabled

the foundation of the George Kelley Readership in memory of its late managing director. The late Major A. Pam, of the Pressed Steel Co., was responsible for raising an industrial fund; this has contributed much towards the running of the Department, which became independent in 1956. Meanwhile, the University Grants Committee provided a grant for the building of the new Laboratory on the Keble Road triangle, and the establishment of the subject was completed by Mr. Isaac Wolfson's endowment of the chair of metallurgy in 1957, when Hume-Rothery, who had controlled the subject since 1926, was elected first Isaac Wolfson professor of metallurgy.

The present staff consists of the Isaac Wolfson professor, the George Kelley reader (Dr. J. W. Christian), two lecturers (Dr. J. W. Martin and Dr. S. L. Altmann) and a graduate assistant (Dr. A. Hellawell). An independent honours degree course was established in 1956, while metallography remains a supplementary subject which may be read by those whose main subject is in another branch of science.

The introduction of metallurgical research into Oxford under Hume-Rothery coincided with an exciting period in the history of the science of metals and alloys. In spite of extremely limited accommodation and numbers, the Oxford School made substantial additions to the theory of alloys. The early work was concerned mainly with alloys of copper, of silver, and of magnesium, but many conclusions applied to alloys of other metals. This work was later extended to alloys of aluminium, of iron, and of the high-melting transition alloys such as those of molybdenum which are becoming of increasing importance. Under the present George Kelley reader, the Oxford work spread into other fields of physical metallurgy, including phase transformations and mechanical properties. Contributions have been made to the theory of martensite, of stacking faults, and of the factors controlling the flow stress of metals and alloys. Dr. Martin has introduced the new techniques of electron microscopy, and has used these to study dispersion hardening of alloys, and is also investigating the high-temperature mechanical properties of alloys, and the fracture characteristics of uranium. Dr. Altmann, as a mathematical physicist, is investigating the theory of the band structure of metals, and Dr. Hellawell's work is concerned with the freezing of alloys and the structure of grain boundaries.

On the teaching side, the University now provides a four-year honours degree course in metallurgy. The metallurgical work, in which emphasis is placed on fundamental principles rather than technological processes, is combined with the full Oxford course in inorganic and physical chemistry. Written and practical papers in these three subjects are taken after three years, and constitute Part I of the final examination. The fourth year is spent on research in some topic related to metallurgical science, and the student submits a thesis and has an oral examination. The honours class is awarded on the combined results of Parts I and II.

In thirty-five years, metallurgy at Oxford has thus expanded from one bench in an organic chemistry laboratory to a laboratory of its own, which is equipped and staffed to deal both with purely theoretical investigations and with experimental work at temperatures ranging from 3,000° C. to that of liquid air, and this lower limit will soon be extended to within a few degrees of the absolute zero of temperature.

UNIVERSITY EDUCATION IN NEW ZEALAND

THE report of the Parry Committee on the New Zealand Universities* follows in many respects that of its predecessor, the Murray Report on the Australian Universities (see *Nature*, 181, 300; 1957). It does, however, right through its various sections, emphasize again and again the present more parlous condition of the New Zealand Universities. This condition has been "engendered by the alarming rate at which staff has been leaving, the inability to recruit new staff of adequate calibre because of low salary rates, the inadequacy of buildings and equipment, and the poor teaching conditions that, in large measure, stem from the high proportion of part-time students."

The Committee stresses that to fulfil their part "the Universities must play a much greater role in the New Zealand community, and must be much better supported financially than they have been in the past". One major difficulty has been that the New Zealand Universities have not been "widely regarded as having a primary responsibility for original investigation and research". If the report succeeds in changing this attitude within the country, it will have achieved a major success, and, provided the time, money and facilities become available, the staff should then be able "to think about the future of their society in relation to its past, to compare and relate the contributions of other cultures to those of their own, to investigate the nature of the physical world and to keep abreast of the investigations of others".

The report directs attention to the serious shortage of university graduates in New Zealand to meet the demands of a number of professions, of many sections of industry, commerce, education and of the public services. In particular, it concludes that a substantial increase in the number of science and engineering graduates will be required for many years to come. An analysis of figures given in the report shows that in 1962 there will be about 1,300 students graduating with bachelor's degrees, and that 2,440 will be wanted in post-primary teaching, agriculture, the Civil Service and universities alone, so that "all the evidence points to an acute shortage of the university-educated persons needed for the country's educational services and economic development". As the report points out, it is going to be essential in the future for the universities and potential employers to give more attention than they have in the past to assessing the probable future demands for people with university education and then preparing plans to meet them.

One reason for this acute shortage may be the high rate of failure among the students. There are those who believe that the entrance standards are too low and that accrediting should be replaced by examination; these people will be disappointed that there is no recommendation to change from accrediting to examination, even when an increase has taken place in the staff of the universities.

One recommendation, which will certainly be hotly debated, is that more of the better students from selected schools should be allowed to commence their university studies at the second-year level. This is already permitted in Greek and mathematics, but if it is extended it will be very difficult to eliminate later. It would surely be better, if the Government accepts the Committee's recommendations for increased staffing, to introduce pass and honours degrees. The University of Canterbury already has this system in the Science Faculty, and the Science Faculties of Victoria and Otago have just introduced it. Much could also be done by raising the standards in secondary schools, though this is naturally associated with the supply of graduates for the teaching profession. The Committee further considers that more could be done to reduce the rate of failure by providing extra assistance to students in coping with the transition from school to university.

The report refers to the fact that at present about 32 per cent of those passing university entrance examinations do not offer mathematics or a language, and that only 9 per cent offer both. Despite the importance of mathematics for a range of disciplines, more than 55 per cent of those passing entrance examinations do not offer the subject. This indicates that some changes, at least, are required in entrance requirements.

The Committee is adamant that the proportion (46 per cent) of part-time students (mostly in arts, law and commerce) is far too high, and that their rate of first-year failure of 60 per cent is also too high. It believes that the value of full-time study has not yet been sufficiently appreciated by students, parents, employers and the Government. It rightly recommends the transition to full-time study for as many students as possible, though this will automatically involve extra expenditure on bursaries and halls of residence.

The recommendations of the Committee on scholarships and bursaries are far-reaching. Many of the awards are at present too low and must be increased. Some of the awards, such as the bonded bursaries for teachers, are out of all proportion to other awards and the demands of the situation. Students who accept such bursaries commonly make a decision on their future vocation far too early in their university careers, and the recommendation to abolish the bonded bursaries should be welcomed by staff and students alike. Other important financial recommendations will enable more students to proceed to the degrees of master and doctor. For too long now students have been leaving New Zealand to study overseas, even though some departments are increasingly able to offer first-class postgraduate instruction. If the recommendations on staffing and research finance are met by the Government, there is no reason why New Zealand postgraduate training in all departments should not be the equal of any university in the Commonwealth.

The staffing position in the New Zealand Universities has reached an alarming condition, almost solely as a result of inadequate salaries. The Committee says that academic salaries must in future bear a relationship to those paid in Australia, since New Zealand has become an important source of

places distant from the universities, and there is no doubt that more co-ordination would benefit both the Universities and the Department. Science in the Universities should also receive a long overdue stimulant if the Government accepts the Committee's recommendation to increase the present research grant of £25,000 to £65,000 this year and £100,000 in 1961. Another notable recommendation is for the establishment of a National Scientific Research Council, which should overcome the present disproportionate expenditure on research between Government research institutions and the Universities, and the present lack of co-ordination.

The recommendations not to establish a veterinary school or a second school of medicine will certainly be unwelcome in some quarters in New Zealand, though the recommendation not to establish further teacher-training colleges away from the present universities will command general support.

The impending disappearance of the University of New Zealand, the coming autonomy of the constituent Universities and the implementation of the recommendations will require, the Committee reports, the re-organization and enlargement of the present University Grants Committee under a full-time chairman. Many, however, will not agree with the suggestion that only a minority of the members of the Committee should be drawn from the academic institutions. The proposal to retain the University Entrance Board may not commend itself to some, and the proposed constitution of five University and five Department of Education representatives under a chairman may well stultify its operations.

It is evident from the foregoing that the Committee has unerringly indicated the present difficult conditions prevailing in the New Zealand Universities. The recommendations it has made will, in nearly every case, if accepted, bring these Universities up to the point where their status will be equal to that of the best universities in the Commonwealth. If the Government of New Zealand, in conjunction with the University Senate, will act as promptly on the other recommendations as the Government has on the salary proposals, there should be little need for those concerned with higher education in New Zealand to fear the future, and the Universities should be able to play their full part in the further development of the country, its economy and social life. It will also give new heart to those among the present staff who have laboured, often under incredibly difficult conditions, to build departments worthy of recognition throughout the world.

l-out during this period
as shown recently[4], the

levels of strontium-90 in milk sampled widely in Great Britain rose during the period April–June 1959 to values which were generally higher (by a factor of the order of 1·5) than the peak-levels during 1958. It has also been noted[5] that the levels of strontium-90 in human bone formed during the early part of 1959 showed a significant increase when

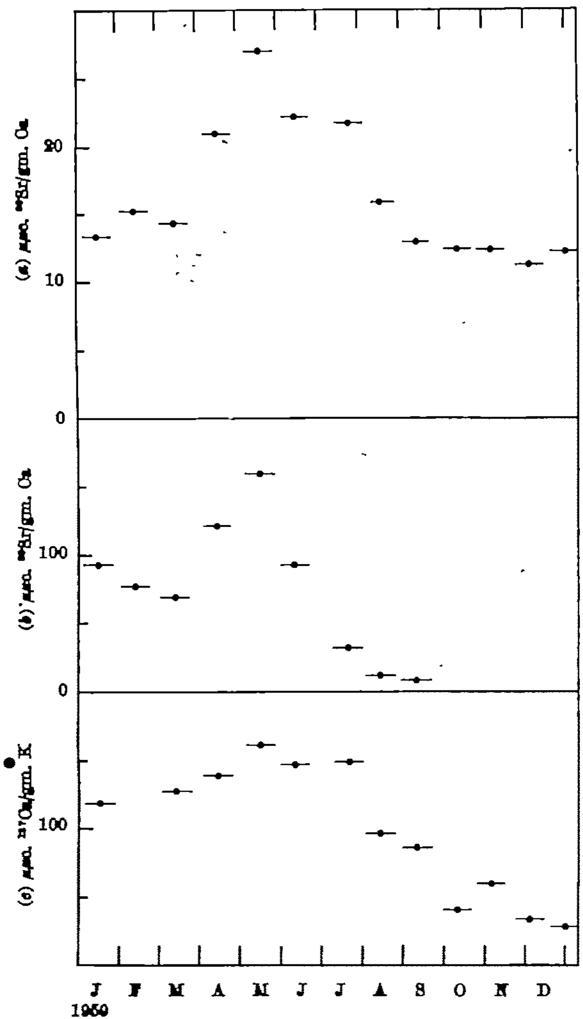

Fig. 1. Levels of fission products in milk from Felinfach, west Cardiganshire, Wales (1959)

compared with earlier levels. We report here the values found for strontium-90, strontium-89 and cæsium-137 in milk samples produced at Felinfach Creamery in west Cardiganshire, Wales, throughout 1959, and we compare these results with those already described for samples of the same series during 1957–58[6,7]. As before, the samples were received at weekly intervals and measurements made on bulked samples, compounded from four consecutive weekly samples. The values obtained for 1959 are shown in Fig. 1.

In our previous report[7], we showed that the average level (15·7 strontium units) of strontium-90 in milk produced at Felinfach during May–August 1958 was 2·2 times the corresponding level (7·0 strontium units) in milk derived from neighbouring pastures (Carmarthen) during May–August 1957 (1 strontium unit = 1 μμc./gm. calcium). A comparison of the average level (21·4 strontium units; Fig. 1) for May–August 1959 with that for the same period of 1958 shows that a further increase occurred in the levels of strontium-90 present in the pastures of this region between 1958 and 1959 (× 1·36).

The 1959 increase of strontium-90 in milk may be due partly to an increased rate of fall-out and partly to an increase in the soil reservoir of strontium-90. The strontium-89/strontium-90 ratios in the milk (from Fig. 1) during the months May–August are on the average 62 per cent of the corresponding ratios in rain falling during the same months[8]. This result is similar to the figure (70 per cent) found for 1958 and it again indicates that a substantial fraction of the activity in the milk was derived from material deposited at or near to the time of milk production. It may be noted that the strontium-89 levels in both milk and rain-water fell sharply over the period May–August 1959 and we have not measured this nuclide in samples collected after that time.

It is useful to compare the 1958 and 1959 rates of fall-out. Estimates of the amount of strontium-90 deposited over the Felinfach–Carmarthen region for successive May–August periods give a 1959/1958 ratio ≃ 0·9 (estimates based on meteorological and fall-out data[1,8]). This fall-out ratio is, in fact, somewhat lower than the corresponding ratio (1·36) for strontium-90 in milk. It should be noted, however, that the deposition of strontium-90 in the region was notably high during April 1959, and the (April–August 1959)/(April–August 1958) fall-out ratio was 1·3. To account for the 1959 increase of strontium-90 in milk, by relating it to an increased fall-out rate, it is therefore necessary to assume that the levels in milk during a given month were influenced by the deposition-rate of the immediately preceding month. This appears to be a reasonable assumption since some integration of activity will occur in the herbage before grazing takes place. In fact, a comparison of the fall-out and milk activity-levels for the open pasture feeding period May–October 1959 indicates that, during this period, the changes which occurred in the milk between any two successive months reflected changes which had occurred in fall-out rate between the two immediately preceding months (Fig. 2).

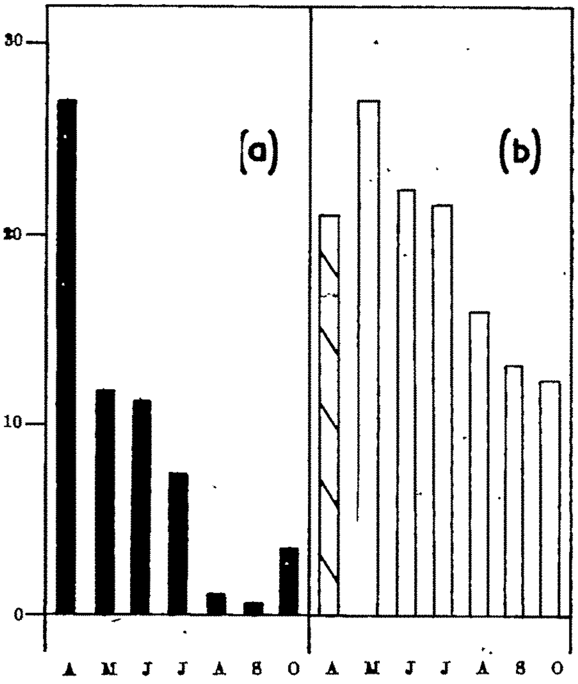

Fig. 2. Comparison of strontium-90 deposition in rain (a, arbitrary units) with levels in milk (b, strontium units) (Felinfach, 1959). The milk-level during April partly reflects the activity present in winter fodder

current theory[3] of

fall-out mechanisms suggests that the average rate of strontium-90 fall-out during March–August 1960 will be somewhat less than half that during the same period of 1959. Similarly, the total strontium-90 accumulated on the ground in the Felinfach–Carmarthen region at mid-1960 would not be expected to rise to more than 1·2 times the value at mid-1959. On this basis, the figure noted above (8·3 strontium units) as the mid-1959 upper limit for milk activity derived from the total soil reservoir becomes 10·0 strontium units at mid-1960. Likewise, the component which depends on the rate of fall-out is expected to be less than 0·5 × (21·4 – 8·3) strontium units = 6·6 strontium units at mid-1960. This treatment suggests that the mid-1960 strontium-90 level in milk from this region will be less than 16·6 strontium units, that is, less than three quarters of the mid-1959 value. The corresponding figure for caesium-137, based on the caesium-137/strontium-90 ratio (6·5) at the end of the open pasture feeding period of 1959, is 80 μμc./gm. potassium.

It should be noted that the figures presented above refer to levels in milk from a single region and they should not be taken to represent the average values for Britain as a whole. The trend of the strontium-90 levels is, however, broadly consistent with the country-wide picture so far described[4]. In view of the outstanding importance of the contribution from milk to the levels of activity which occur in human bone, the above prediction of a downward trend in milk activity suggests that the future trend of strontium-90 levels in newly formed bone should also be downward.

We are indebted to Prof. W. V. Mayneord, in whose Department the work was carried out, for his constant guidance and encouragement.

publication in journals. Sir William Osler had died in 1919, but the very wonderful Lady Osler still regarded her home at 13 Norham Gardens, Oxford, as a centre for the young, and she and Lady "Sherrie" were two on whom one never failed to call, usually on Sundays at tea-time, every term. Fulton helped to catalogue "Bibliotheca Osleriana", which was finally published in 1929; but before that, with the M.A. and D.Phil. Oxon. to his credit, he returned for a while to Harvard, where he took his M.D. in 1927. As assistant neurological surgeon at the Peter Bent Brigham Hospital, he worked under the master neuro-surgeon, Harvey Cushing, and he became in succession his pupil, close friend and, later, biographer.

As a Fellow of Magdalen he continued research in neurophysiology during 1928–30, and then in 1931 he was appointed to the Sterling chair of physiology at Yale, where one of his first decisions was to name his new home the 'Laboratory' rather than the 'Department' of Physiology. Many came to him from outside, attracted, as *The Times* obituary notice of him stated, by his breadth of outlook, humanistic approach, and personal example, his own interests being mainly electrophysiological, electro-cardiographic, and endocrinological, with the physiology of aviation becoming an outstanding fourth during the Second World War.

In Oxford he had married Lucia Pickering Wheatland, and in 1956 there was a reception in the History of Medicine Library at Yale to mark his total of twenty-five years of service in the Laboratory of Physiology and in the Department of the History of Medicine. Fulton was given a bound copy of a special issue of the *Yale Journal of Biology and Medicine*, and a silver medal which his friends had inscribed to him as physiologist, teacher and humanist.

In 1959, on his sixtieth birthday, friends met again, this time at his home at Mill Rock, to be presented with copies of "The Making of a Library", in the letters on which it was based being one from Arnold C. Klebs which quoted:

> "Grau ist alle Theorie
> Und grün der goldne Baum des Lebens",

and in which he stated that he believed in loving the old authors when they had something lovable. Wilmarth S. Lewis briefly said that Dr. Fulton alone survived of the three friends (Harvey Cushing, Klebs and Fulton) who brought the Historical Library to Yale, and that November 1, 1959, was a moment of congratulation and thankfulness: of thankfulness for Fulton's restored health, and of congratulation on his being only sixty, with years more of discovery and instruction before him. Elizabeth Thomson, who with Madeline Stanton was responsible for most of the planning of the reception, wrote to me that Mrs. Fulton was meeting guests at the top of the steps looking lovely and giving no hint of the strain of arranging a party of seventy *sub rosa*. However, Fulton found everything a real surprise and he was simply delighted with the book.

For myself I am indebted to him for countless kindnesses over the years, including the period after the First World War, and I am truly sorry that I am not to greet him in person at the tercentenary of the Royal Society, and at the centenary of the National Hospitals for Nervous Diseases. He would, I know, have entered with zest into both occasions.

KENNETH J. FRANKLIN

Dr. S. F. Birch

STANLEY FRANCIS BIRCH was born in November 1899 at Pewsey in Wiltshire, and was educated at Hurstpierpoint College and St. Paul's School, before going to the Imperial College of Science and Technology, whence he graduated. Working with Prof. J. F. Thorpe, he obtained the degree of doctor of philosophy for research work on three-carbon tautomerism, after which he joined the staff of the (then) Anglo Persian Oil Company, with which he was to spend the whole of his working life.

His great interest was in research connected with organic chemistry, and it was in this sphere that, in 1923, he commenced his career. Under Dr. A. E. Dunstan and with a small band of scientists, he worked in a country house at Sunbury-on-Thames; these premises he was to see develop into the Research Centre of the British Petroleum Co., Ltd. An investigation of the malodorous components of the lighter fractions from Persian crude oils led to the identification of mercaptans and from this discovery stemmed a major research effort concerning the nature and properties of sulphur compounds in petroleum, which he continued, with some interruptions, for the next thirty-five years. In this field he was regarded as an authority, and he published numerous scientific papers and gave many lectures both in Britain and the United States. He visited the latter country many times and was well known in many industrial research centres, universities and organizations connected with the American Petroleum Institute and American Chemical Society, of which he was a member.

The study of the reactions of hydrocarbons was, however, a branch of chemistry in which he made signal contributions to the petroleum industry. This work had, as its major achievement, the discovery of the sulphuric acid alkylation process in 1936 which, together with processes resulting from the determination of the octane numbers of pure hydrocarbons, and studies of the fractionation of petroleum distillates, formed the basis of the supply, by the Abadan refinery, of vast quantities of aviation spirit during the Second World War. His researches connected with the reactions of hydrocarbons made him realize, from a very early date, the potentialities of the petroleum chemical industry, and at his death on March 25 he held the position of research associate in the Petroleum Chemicals Department.

Birch believed very strongly that research could only be directed by those in close contact with the practical operations and that most discoveries came about as a result of critical observation and experimental skill. Until the last three years of his career, when administrative duties forced him, reluctantly, to move, he occupied an office situated close to the laboratories and was a frequent visitor to the bench where many informal technical discussions took place. 'Bill', as he was known to his friends, had wide-ranging interests apart from his research work. He was keenly interested in the theatre and ballet and antique works of art, and many of his leisure hours were spent building electronic and other gadgets.

He died on March 25, and is survived by his wife, Hilda Mary, whom he married on June 24, 1925. His many friends will sadly miss the pleasure of his company and the stimulation of his personality.

R. A. DEAN

Dr. J. H. Oliver

ON June 1 James Herbert Oliver died suddenly in Ankara. He had undertaken a visit to Ceylon and India and was returning to Britain by way of Turkey, where, in pursuance of a life-long interest, he was proposing to study native barleys.

Born in Portsmouth in 1901, he was educated at St. John's College, Southsea, and the Municipal College, Portsmouth, and after a period of private study he graduated in 1920. His first post was at the Olympia Agricultural Research Station near Leamington, where he worked under Dr. Herbert Hunter, who was widely known for the production of the brewers' barleys, Spratt Archer and Plumage Archer. It was here that Oliver developed the interest that he followed so assiduously throughout

his life. Re

. His researches in this

field led him to the conclusion that coastal mud and sand become an important reservoir for these nutrients, which are distributed during times of storm and gale.

Dr. Oliver was a member of the Salters' Company, honorary hydrologist to the Zoological Society, and a member of the Challenger Society, whose meetings frequently were enlivened by erudite contributions delivered with a refreshing humour. He was a tireless and inventive worker, always striving to improve his apparatus or to increase the accuracy of his results. His energy and enthusiasm were infectious, and he was ever ready to lay aside his own work to help others. Over all his life there pervaded an ebullient and generous personality. He enjoyed life to the full because he had come to terms with it—his terms. He was a gracious and charming friend, and he will be sorely missed by all who had the good fortune to know him.

ngton's laboratory in
iate, and a measure

of the great honour in which he is held by physiologists, that he should have been chosen in 1954 to deliver the Silliman Memorial Lectures, exactly fifty years after the delivery by Sherrington of the classical series published as "The Integrative Action of the Nervous System". Granit's researches in sensory physiology have explored the relationship between sense organs and the nerve centres into which they send signals, and which, in turn, exercise centrifugal control over receptor sensitivity. In 1947 he published an important book, "Sensory Mechanisms of the Retina". The retina offered him a central nervous structure, uniquely accessible to stimulation by the natural and selective agency, in which the interplay of excitation and inhibition could be studied. More recently, he has found that the sensitivity of the retina can be modified by signals sent out to it from the brain. Newer work in his laboratory has extended his general approach to sensory problems to the special case of muscle receptors. This work has shown that these receptors are under the control of the central nervous system, and that such control can drive the motor nerve cells of the spinal cord servo-fashion over the muscle reflex arcs. The bold conception of a balance between direct control and servo-control of muscle is a typical product of Granit's imaginative insight, and is likely to stimulate research into the physiology of posture and movement for many years to come.

Prof. G. B. Kistiakowsky

The announcement of the election of Prof. G. B. Kistiakowsky as a foreign member of the Royal Society will have given great pleasure to physical chemists everywhere and especially to those interested in reaction kinetics. He was born and received his school education in Kiev, but his lifelong interests were probably shaped during his research student days in Berlin which, in the 1920's, was surely the world centre of the maturing science of physical chemistry and which has been the seminary of so many distinguished workers in this field. In 1926, Dr. Kistiakowsky went to Princeton and in 1930 he migrated to Harvard. From his pen have come numerous accounts of investigations which have always been marked by an elegance in conception, execution and interpretation which is unmistakably his. He gave resonance quantitative significance by his measurements of heats of hydrogenation of unsaturated compounds; with Gomer, he was the first to measure the rate of combination of methyl radicals; he has developed methods for studying very fast reactions and, latterly, by his studies of the reactivity of photochemically produced methylene-type radicals, directed attention to fundamental problems of rate-theory. Light, spectrometers, shock tubes, mass-spectrometers and explosives—the tyrants of many chemists—have been his slaves. He has also been a great public servant in the United States in war and in peace, which fact has been recognized by many awards and has culminated in his present appointment as scientific adviser to President Eisenhower. These are but a few of his accomplishments, to which one must add his consummate skill in making quartz spiral gauges, as a skier, and raconteur, which, with his vivacity and friendliness, have made him so warmly regarded by students and colleagues from the United States and overseas.

Academician L. D. Landau

ACADEMICIAN L. D. LANDAU, who has been elected to foreign membership of the Royal Society, is a theoretical physicist with interests in all basic problems of physics regardless of the particular special field in which they arrive. His best-known work includes the theory of the diamagnetism of free electrons, the theory of transitions in atomic collisions, liquid helium, the divergence problems in quantum field theory. He has inspired and trained many distinguished pupils, and the series of text-books on theoretical physics written by him with E. M. Lifshitz on the basis of his lecture courses have had a profound influence on teaching in the U.S.S.R. He approaches physics with a very personal style, as impatient of pedantic purism as of slipshod physical argument. After working in Leningrad and Kharkov, he has now for many years held a professorship at the Institute of Physical Problems in Moscow.

Marshall Chair of the Physiology of Reproduction, Cambridge: Dr. A. S. Parkes, C.B.E., F.R.S.

DR. A. S. PARKES, whose appointment to the newly established Marshall chair of the physiology of reproduction in the University of Cambridge has recently been announced, has worked for nearly thirty years in the National Institute for Medical Research, where he is head of the Division of Experimental Biology. Before joining the scientific staff of the Medical Research Council, Dr. Parkes had held a Beit Memorial Fellowship and a Royal Society Foulerton Studentship, and he had, at an early age, established himself as a leading investigator of the physiology of reproduction. His first interest was in ovarian function, knowledge of which was much advanced by his work; in later researches he contributed to most aspects of the physiology of sex hormones. In recent years he has paid much attention to the effects of cold on cells, tissues and the whole animal and, in collaboration particularly with Dr. Audrey Smith and Dr. C. Polge, he has made remarkable observations in this branch of biology. Dr. Parkes has always been alive to the practical applications of his researches; to him is due the method of administration of steroid hormones by tablet implantation, and the work on hypothermia has led to important developments in the storage of erythrocytes, of spermatozoa and of tissues for grafting. Apart from his laboratory researches, Dr. Parkes is keenly interested in world population problems. It is indeed appropriate that he should be the first to occupy a chair that bears the name of his former teacher, and which will give him the opportunity to develop a university department devoted to an important branch of physiology.

Educational Co-operation in the Commonwealth

IN a written answer to a question in the House of Commons on June 24, Mr. R. Thompson, replying for the Minister of State for Commonwealth Relations regarding progress with plans for the award of scholarships under the Commonwealth Scholarship and Fellowship Plan, gave the following information from the Association of Universities of the British Commonwealth. Canada proposes to make ten scholarships tenable from October 1960 and twenty nominations from the United Kingdom have been requested. Offers of scholarships, tenable from March 1961, for study in Australia have now been made of Commonwealth countries and twenty-five nominations requested from the United Kingdom. New Zealand has announced the offer to other Commonwealth countries of twenty-six scholarships and fellowships tenable at any one time and up to five nominations for scholarships tenable from March 1961 have been requested from the United Kingdom. India has announced the offer of forty-five scholarships and fellowships to various countries of the Commonwealth, and the Federation of Malaya has offered postgraduate awards to more than ten Commonwealth countries, including the United Kingdom, tenable from May 1961. The Federation of Rhodesia and Nyasaland is offering about five postgraduate scholarships, visiting fellowships and mature awards tenable from January 1961, and the East African Governments have offered two scholarships, tenable at Makerere College, for which nominations have been requested from the United Kingdom. Pakistan, Ghana and Ceylon also announced offers of scholarships at the Commonwealth Education Conference, but no details are yet available. South Africa had offered a total of twenty scholarships tenable at any one time and five nominations from the United Kingdom had been requested. The Association of Universities of the British Commonwealth proposes to publish a full report of the work done under the Plan at the end of the first year of operation.

Advisory Committee on Nuclear Safety

AN Advisory Committee on Nuclear Safety has been appointed "To advise the Minister of Power and the Secretary of State for Scotland on any matters affecting the functions of those Ministers in relation to safety under the Nuclear Installations (Licensing and Insurance) Act, 1959, which may be referred to them by either of those Ministers or which in the Committee's opinion ought to be brought to the notice of either Minister, apart from any such reference". Its membership is as follows: Sir Alexander Fleck (*chairman*); Dr. T. E. Allibone, director of the Associated Electrical Industries Research Laboratory, Aldermaston; Mr. G. F. Bullock, general manager, Vulcan Boiler and General Insurance Co., Ltd., Manchester; Sir John Cockcroft, Master of Churchill College, Cambridge; Mr. Patrick Connor, Scottish Divisional Officer of the Amalgamated Engineering Union; Dr. S. Zebra : a New Zero Energy Reactor

THE United Kingdom Atomic Energy Authority has decided to build a zero energy fast reactor at the Atomic Energy Establishment, Winfrith. The reactor has been named *Zebra* (zero energy breeder reactor assembly). The reactor has been designed to permit the study of the neutron physics of a wide variety of fuel assemblies containing uranium and plutonium. The assemblies under study will be built up by loading fuel elements into a steel matrix (approximately a cube of side 10 ft.). The fuel elements contain both fuel plates and plates of neutron-absorbing material : the latter will be used to simulate the nuclear properties of the coolant and structure material which would be required in a power reactor. *Zebra* will be operated at room temperature and the heat output from the nuclear reactions in the core will be kept very low so that no cooling system is necessary. It is planned to commission the zero energy reactor during 1962. *Zebra* will be used to obtain information that will be needed for the design of a prototype which is likely to be the next step in the development of the fast reactor by the Authority. The work at Winfrith will complement that carried out at the Dounreay Experimental Reactor Establishment.

The Diploma in Mathematics

THE Mathematical Association has now set up an Examinations Board to award a Diploma in Mathematics (Dip. Maths.). The printed regulations are to be available in the early autumn of this year, and it is expected that the first examination will be held at local centres in the British Isles in November 1961. The Diploma is intended for teachers who have not had the opportunity of reading for a degree which includes mathematics. Considerable interest in the proposal has been shown by the teacher-training colleges, the students of which might take the examination soon after completing their three-year course if they have taken mathematics as a special subject. Many of the technical colleges contemplate establishing part-time courses designed as a preparation for this Diploma.

A draft syllabus is now available from the Secretary of the Association at 29 Gordon Square, W.C.1. The examination will consist of four papers covering three separate schemes of work, and candidates will be required to pass in all sections, though reference on one occasion will be allowed in any one section. The first two papers are in pure mathematics, and these will form the core of the Diploma. The standard expected is that which might be reached by about a year of full-time study beyond the Advanced Level of the General Certificate of Education. The second section deals with mechanics and statistics. In this part, bearing in mind the special needs of women students, many of whom do none of this work at school, the standard will lie part-way between Ordinary and Advanced Level. It is regarded as essential that anyone teaching mathematics at any stage should have some competence in this part of the work. An interesting (and perhaps controversial) section is the third, which deals with the history and ideas of mathematics. Detailed history will not be required, but candidates will be expected to have a clear understanding of the origin and development of the various subjects and topics up to the end of the seventeenth century, with some awareness of subsequent developments. The purpose of the paper is to ensure that teachers will be able to illustrate and enliven their lessons by passing comment, or even by digression, about the great names and the fruitful periods in the subject. This could ensure that mathematics lessons of the future would cease to be, what they so often are to-day, a sequence of mechanical processes.

Radio and Electronics Engineering

THE Education Committee of the British Institution of Radio Engineers has prepared a report on the education and training of the professional radio and electronics engineer (Pp. ii+31. London: British Institution of Radio Engineers, 1960). The report defines the field of radio and electronics, and considers the qualifications required for professional competence in this field. After a brief reference to the Institution's own examination, the relevant educational facilities in universities, colleges of advanced technology and technical colleges are reviewed in some detail. Consideration is given to the radio and electronics content of university degree courses in physics and electrical engineering, in diploma in technology courses in applied physics and electrical engineering, and in courses for higher national diplomas and higher national certificates with endorsements. Reference is made to postgraduate work in radio and electronics in universities and colleges of advanced technology. Various forms of practical training are reviewed, and the report concludes with a group of general recommendations. It is advocated that there should be increased emphasis on radio and electronics in electrical engineering and in physics courses, and that there should be more new courses specifically designed to qualify for work in the radio and electronics field. There is an extensive bibliography followed by an appendix dealing with the training of technicians and craftsmen, and one compiling information about the proportion of radio and electronics work in existing courses. Two charts are given illustrating the scope of radio and electronics engineering, and the entrance requirements and basic structure of the main educational routes leading to professional, technician and craft qualifications.

The Royal College of Science and Technology, Glasgow

THE annual report on the one hundred and sixty-third session (1958–59) of the Royal College of Science and Technology, Glasgow, includes lists of titles of theses approved for the award of the degree of Ph.D., Glasgow, as well as those approved for the Post-graduate Diploma and for the Associateship of the College (Pp. 64. Glasgow: Royal College of Science and Technology, 1959). There is a further list of recent publications by members of the College, and brief reports from departments and the Glasgow School of Architecture refer to industrial reports prepared during the year by the Department of Civil, Mechanical and Chemical Engineering for the British Shipbuilding Research Association on natural circulation and heat transfer in water-tube boilers, and on the corrosion of water-cooled pistons, for the Cold Rolled Sections Association on the gusset plate strength of two-member in-line welded joints, and the collapse strength of uniformly compressed plates, and for the Motherwell Bridge and Engineering Co., Ltd., on a load-test of the Goliath crane at Hunstanton Nuclear Power Station.

Cancer of the Lung

THIS report has been issued of a study-group of experts from seven countries which met in Geneva during November 1959 to review existing knowledge of the ætiology of cancer of the lung and to suggest ways of improving it (Technical Report Series, No. 192: Epidemiology of Cancer of the Lung—Report of a Study Group. Pp. 13. Geneva: World Health Organization, 1960. 1 Swiss franc; 1*s.* 9*d.*; 0.30 dollar). The role of cigarette smoking in the causation of cancer of the lung, and of other factors such as air pollution, specific industrial causes, ionizing radiations, chronic pulmonary disease, and heredity were discussed. The study-group outlined a series of special studies designed to provide epidemiological information that will help explain the great increase in the incidence of cancer of the lung in some countries and furnish a basis for its control. They include studies of the reasons for geographical differences in the incidence of, and in mortality from, cancer of the lung; of its relative incidence in areas where the special histological classification suggested by Prof. L. Kreyberg, of Oslo, can be used; and of morbidity in countries where reliable statistics are not available. The study-group also made suggestions about the identification and intensive investigation of groups of people either exposed to an excessive degree or scarcely exposed at all to specific factors thought to have an influence on the disease, about the simultaneous study of multiple factors, and about genetic and experimental studies.

Collected Papers of the Rowett Research Institute

As in recent years, the "Summary" and "Subject Reviews", which are part of the annual volume, "The Collected Papers of the Rowett Research Institute", have been published separately and can be obtained from the Librarian, Reid Library, The Rowett Research Institute, Bucksburn, Aberdeen (5*s.*, post paid). This booklet gives a most useful and readable survey of the work of the Institute as embodied in the papers published during the academic year 1958–59. Some of the problems tackled and the results obtained are of practical importance to the agricultural industry, but many others bear on basic scientific issues, and so this summary should be of great use to a wide variety of scientists and agriculturists. Full references to all the papers published in the period are given. Many readers will find their appetites whetted for further information, and will be glad to learn that a limited number of reprints of the various papers are available for free distribution and particular ones may be obtained on application. The commendable practice has been continued of publishing two reviews on special topics in which work has been going on in the Institute for a number of years. On this occasion, the reviews are by Dr. G. A. Garton, on "Lipid Research at the Rowett Institute, 1951–59", and by Dr. G. A. Lodge, on "Experiments on the Nutrition of Sows". Both these reviews are

for articles on electronics now reaches its tenth year. Articles published during 1960 will be considered by the panel of judges early in the New Year, and six premiums of 25 guineas will be awarded. Further information can be obtained from the Electronic Engineering Association, 11 Green Street, London, W.1, to which also eligible articles should be submitted before the end of the year.

U.S. Record of Published Books

A NEW *American Book Publishing Record* is now being issued which collects all entries listed in the *Publishers' Weekly* during the previous calendar month and arranged according to the Dewey Decimal Classification; a combined author and title index is included (Vol. 1, No. 2, for the month ending March 1, 1960. Pp. 96. Subscription: 11 dollars for 12 monthly issues (U.S.A. 10 dollars). New York: R. R. Bowker Company, 1960). Books are defined as non-periodical publications of 49 pages or more, and books on all subjects are included as well as those printed abroad, but 'published' in the United States in the sense of being offered for sale there through a single designated agent.

Bibliography of British Journals and Newspapers

MR. F. ATKINSON, of the Hampstead Public Library, has prepared an admirable bibliography covering, as Mr. F. Williams points out in an introduction, every book of substance dealing with English newspapers and journalism during the most expansive period in their history (Library Association. Special Subject List No. 32: The English Newspaper since 1900. Pp. 31. London: Library Association, 1960). Nearly 400 entries are classified under a dozen headings, of which biography includes most (109), and no aspect of the Press is left uncovered.

Cytology and Cell Culture Genetics of Man

"A SYMPOSIUM on Cytology and Cell Culture Genetics of Man" has been published by the *Amer. J. Human Genetics* with the aid of funds from the National Institutes of Health, Public Health Service, U.S. Department of Health, Education and Welfare. Reprints may be obtained on request from Dr. Gordon Allen, Building 10, Room 2*N*208, National Institutes of Health, Bethesda 14, Maryland. The symposium is 42 pages in length and contains the following papers, originally presented in Pennsylvania on September 2, 1959: "The Chromosome Complements of Human Somatic Cells", by E. H. Y. Chu; "Human Cytogenetics: Its Present Place and Future Possibilities", by C. E. Ford; "Sexual Dimorphism in Interphase Nuclei", by M. L. Barr; "Some Systems for the Genetic Analysis of Mammalian Cells", by L. Sachs and M. Krim; and "Cell Cultures for Human Genetic Studies", by M. Fraccaro.

Royal Commission Awards for the Exhibition of 1851

THE following awards for 1960 have been announced. *Senior Studentships*: B. Brummer (Imperial College of Science and Technology), for research in physical chemistry at the Imperial College of Science and Technology; M. J. M. Leask (University of Oxford), for research in physics at Oxford; S. K. Malhotra (University of Oxford), for research in zoology at Oxford; D. J. Williams (University of Sheffield), for research in theoretical chemistry at Oxford. The Senior Studentships are of the value of

£800–£900 a year and tenable ordinarily for two years. *Overseas Scholarships :* M. H. Jericho (Dalhousie University), for research in physics at Cambridge; P. S. Simony (McMaster University), for research in geology at the Imperial College of Science and Technology; A. G. Moritz (University of Adelaide), for research in physical organic chemistry at Cambridge; D. St. C. Black (University of Sydney), for research in organic chemistry at Cambridge; G. D. Jones (University of Canterbury, New Zealand), for research in physics at Oxford; P. J. Herley (Rhodes University, Grahamstown), for research in physics at Cambridge; T. J. B. Webb (Trinity College, Dublin), for research in biochemistry at Cambridge; A. J. Walton (Trinity College, Dublin), for research in physics at Cambridge; P. S. Sarin (Delhi), for research in organic chemistry at Cambridge; A. Q. Sarker (Rajshahi), for research in theoretical physics at Birmingham. The Overseas Scholarships are of the value of £550–£650 a year and tenable for two or three years.

University News : Belfast

Dr. D. W. R. Mackenzie has been appointed to a lectureship in microbiology.

Birmingham

Dr. Stanley Mandelstam, at present assistant research physicist in the Department of Physics of the University of California, has been appointed to the newly established chair of mathematical physics within the Department of Mathematical Physics from October 1. Appointments to lectureships and research fellowships are as follows. *Lectureships :* Dr. R. W. Whitworth and Dr. A. B. Robbins (physics); Dr. J. R. Majer (chemistry); Dr. F. W. J. Teale and Dr. D. G. Walker (biochemistry); Dr. E. H. Creaser (microbiology); Dr. D. F. Gibbons (physical metallurgy). *Research fellowships :* A. H. M. Hoare (pure mathematics); J. S. Lilley (physics); B. Cockayne (physical metallurgy); E. N. Corlett (senior research fellow in the Department of Engineering Production).

Cardiff

Dr. S. P. Hutton, at present deputy director of the National Engineering Laboratory, East Kilbride, Glasgow, has been appointed professor of mechanical engineering.

Liverpool

The following appointments are announced. *Readerships :* R. L. Plackett (mathematical statistics); A. C. Shuttleworth (veterinary surgery); Dr. C. L. Smith (zoology). *Senior lectureships :* Dr. A. S. Aldred (electric power engineering); Dr. A. Bolton (civil engineering); Dr. H. W. Douglas and Dr. T. B. Grimley (inorganic and physical chemistry); Dr. V. H. Heywood (botany); Dr. J. F. Norbury (fluid mechanics); Dr. T. G. Richards (physiology); Dr. I. C. Geddes (anæsthesia); Dr. J. S. Scott (obstetrics and gynæcology).

London

The following appointments to readerships are announced: Dr. P. G. Saffman (mathematics, tenable at King's College); Dr. D. V. Ager (geology, tenable at the Imperial College of Science and Technology); Dr. M. Shepherd (psychiatry, tenable at the Institute of Psychiatry).

Oxford

Appointments to lectureships are as follows: D. F. W. Baden-Powell (prehistoric archæology); Dr. M. J. Kearsley (mathematics); Dr. H. R. Harré (philosophy of science).

Swansea

The following appointments to lectureships have been made for the session 1960–61: Mr. I. G. Evans (pure mathematics); Dr. H. T. Miles (physics); Dr. J. A. Schofield (organic chemistry). Dr. S. K. Zaremba has been appointed senior lecturer in pure mathematics.

Announcements

It has been announced that Prof. Adolf Butenandt (Munich), president of the Max-Planck Society, has been elected an honorary member of the Leopoldina German Academy of Science.

Dr. P. C. Spensley, a temporary assistant director of the Tropical Products Institute, has been appointed acting director of the Institute, until Mr. E. S. Hiscocks takes up duty towards the end of the year.

The Science Museum, South Kensington, has recently brought into operation a star-projector to demonstrate the daily motion of the stars and their appearance at different parts of the world and at different times of the year. The stars are projected on the inside surface of a hemispherical plaster dome 20 ft. in diameter. Demonstrations are given once daily, from Monday to Friday only.

The ninety-seventh meeting of the British Pharmaceutical Conference will be held in Newcastle during September 5–9. Further information can be obtained from W. K. Fitch, British Pharmaceutical Conference, 17 Bloomsbury Square, London, W.C.1.

The tenth Canadian High Polymer Forum will be held at the Alpine Inn, Ste. Marguerite, Quebec, during September 7–9. The Forum is sponsored by the National Research Council of Canada in co-operation with the Chemical Institute of Canada. Further information can be obtained from Dr. D. A. I. Goring, Canadian High Polymer Forum, Pulp and Paper Research Institute, McGill University, Montreal, Quebec.

The first International Symposium on "Cori's Ester and Phosphorylated Glucides" will be held during September 13–18 at the Museum of Science and Technology, Milan. Further information can be obtained from the Comitato Organizzatore del 1° Symposium Internazionale sull estere di Cori e sui glucidi fosforilati, Via Modica 6, Milano.

The Department of Scientific and Industrial Research is organizing a conference on "Ergonomics in Industry" during September 27–29 at the Connaught Rooms, Great Queen Street, London, W.C.2. Further information can be obtained from Miss H. M. Clay, Department of Scientific and Industrial Research, 14–18 Cornwall Terrace, Regent's Park, London, N.W.1.

Erratum. It is regretted that an announcement referring to the seventeenth International Congress of Pure and Applied Chemistry to be held in Munich during August 26–29 was inadvertently inserted in the July 2 issue of *Nature*. The announcement is incorrect.

years from October 1, 1959, for equipment for the analysis of bubble-chamber films; £75,000 to Prof. R. Hanbury-Brown at the University of Manchester for 2½ years from January 1, 1960, for a new type of photoelectric stellar interferometer, and £60,820 over 3 years from April 1, 1960, to Prof. A. C. B. Lovell for research with the 250-ft. steerable radio telescope and another £52,000 over 4 years for its maintenance.

With the exception of fire research, expenditure on which decreased to £29,743 from £37,174 in 1958, hydraulics research (£90,768; £100,650 in 1958), water pollution research (£100,586 from £103,882) and, surprisingly, road research, which decreased by £25,751 to £535,062 (compared with £441,762 in 1957) although work on traffic safety problems has notably expanded, the net expenditure on all branches of the Department's work increased in 1959, though that on food investigation (£326,908), forest products (£139,965), Geological Survey and Museum (£338,404) and pest infestation (£95,642) was practically unchanged. The biggest increases were in headquarters administration, etc. (£436,190 from £377,905); National Physical Laboratory (£801,550 from £737,950); National Engineering Research Laboratory, £606,055 compared with £507,104 in mechanical engineering research in 1958. Expenditure on radio research was £193,681 compared with £159,398 in 1958, and, on the new Warren Spring Laboratory, which appears for the first time in the summary of expenditure, £397,413.

Annual grants to research associations amounted to £1,683,195 (£1,700,330 in 1958) and special grants to £88,570; contributions to European nuclear research remained at £1,100,000 and expenditure on headquarters overseas liaison increased from £85,583 to £92,137.

The report records an increase in staff of the Department to 5,506; but although net recruitment over the year was satisfactory, difficulties in recruiting certain categories of staff continued. The number of research associations has now reached fifty, and at the request of the Board of Trade and the Federation of British Industries, the service of technical digests has been restarted. The Overseas Liaison Division was merged with the Headquarters Information Division at the end of the year.

th-eastern portion of
rt of the Hunterian
first phase consisted
rs of museums above

it. The second phase is the Nuffield College of Surgical Sciences, a residence for eighty postgraduate students, which faces Lincoln's Inn Fields immediately to the east of the old College buildings and to the north of the new phase I block.

The buildings recently opened lie behind the old College and are the westward continuation of phase I, the floor-levels corresponding exactly except that there is a fifth story in the new block, which accommodates the animal house. In general terms, it may be said that phase I is primarily a museum block, whereas the new building (phase IIIa) contains research laboratories and lecture and demonstration rooms.

The fourth floor is occupied by the Department of Anatomy, with a fine Dissecting Room at the western end and a Prosector's Room leading from it, in which anatomical teaching material is prepared. Running east from the Dissecting Room there is a corridor flanked by staff offices and research rooms where work is being done on the anatomy of conjoined twins, the nerve endings in the larynx, and in preparing material for electron microscopy. Research in this field is concerned with the structure of the nuclear cytoplasmic interface in normal and neoplastic cells; the electron microscopy of human gastric mucous membrane in relation to exfoliative cytology; and the electron microscopic changes produced in the prostatic epithelium of mice by hormonal stimulation.

At the western end of each story there is a large room, the size of the Dissecting Room, that on the third floor being used by the Departments of Physiology and Pharmacology as a demonstration room, with benches for experimental work. The research rooms on this floor belong to the Department of Ophthalmology, in which work is being done on the clinical applications of antibiotics in ophthalmology, with special reference at the moment to the possible exploitation of interferon in virus diseases of the eye; on the distribution and nature of refractive errors, especially on the optical components during growth; and on blindness, including both statistical and experimental studies. It has been established that the general pattern of retinal metabolism conforms to that of the brain, and work is being planned to seek for possible biochemical defects in the retina of rats and mice affected with hereditary degeneration of the retina.

It has been shown that sodium iodate, sodium fluoride, and a group of phenoxyalkanes can produce degeneration of the retina in the rabbit. Cysteine has been found to be effective in preventing the experimental degeneration induced by iodate and by iodoacetate, but is apparently ineffective against the phenoxyalkanes and fluoride. Work is proceeding to seek for other protective substances against both the experimentally induced lesion and spontaneously occurring blindness.

On the second floor of phase I is the main Museum of Pathology and some research rooms for the professor and his lecturers. This Department has now been able to extend into the new building, having a demonstration room at the west end and more laboratories in which at present work is being done on tissue culture and X-ray microscopy. The tissue culture work is designed to study the distribution of adenoviruses in the tonsils of normal persons in relation to age, and the incidence of virus infections of the lung. Organ culture is being carried out to assist the research already going on in the Department into lung cancer.

X-ray microscopy is being used to explore the possibilities of the method for elucidating the structure and constitution of cells and connective tissue, and to confirm by physical means some of the results obtained by histochemical techniques.

The first floor houses the Department of Dental Science, having the Odontological Museum at its western end. The research work of the Department is directed towards exploring the aetiology of pyorrhoea and dental caries. A morphological peculiarity of the interdental septum has been demonstrated whereby a trivial aberration of tooth eruption is liable to initiate a chronic ulcer between the teeth which progresses in some cases to the establishment of a pyorrhoea pocket.

On the biochemical side, research is proceeding into the amino-acid composition of enamel protein, and it has been shown that this protein is quite different from other skin keratins; and on the bacteriological side, a special study is being made of the organisms capable of living on enamel proteins.

A third problem engaging the attention of the Department is the determination of the earliest reaction of bone to metastatic deposits of carcinoma; and a study is also being made of salivary gland metabolism using radioactive tracers.

On the ground floor there are two committee rooms, a Fellows' Common Room, and an excellent lecture theatre to seat 140 students, a great asset to the College, which is, however, still short of lecture and demonstration room-space to meet all the requirements of its educational programme. The building of phase IIIb, which will complete the restoration of the College, is planned to make good these deficiencies.

THE ROYAL BOTANIC GARDENS, KEW

THE Students Day at the Royal Botanic Gardens, Kew, was held this year on May 7. Many universities, schools and training colleges were represented as well as members of a number of scientific societies. Altogether, about six hundred visitors were present. The exhibits this year were not restricted to the Herbarium but were spread over the various buildings and greenhouses at the north end of the Gardens.

Many of the Herbarium exhibits were concerned with the work of the taxonomist. Starting with the collection of plants in the field, there were demonstrations of drying and mounting leading to the ultimate naming and classification of the specimens. The work of the monographer was also demonstrated, with particular reference to the genus *Ficus* (figs), which includes nine hundred species.

A challenge to visitors was provided by an exhibit illustrating the classification of grasses. Two contrasting sets of specimens were displayed. In one, seven of the larger tribes were illustrated by herbarium specimens which were typical in respect of their inflorescences and spikelets. Contrasted with these were a number of non-typical examples from the same tribes, in which there were certain mutual resemblances. The compact spike-like inflorescence illustrated by *Chaetostichium minimum* in the Chlorideae, *Rhytachne rottboelloides* in the Andropogoneae and *Prionathium pholiuroides* in the Danthoneae were surprisingly similar. This apparent parallelism, however, was shown to be misleading, since diagnostic characters other than those of gross morphology are essential to the correct placing of a given species. The employment of other criteria such as the nature of

germination depended

on the principle of vernalization. A sample of *Malus* seed had been maintained at a temperature of 36° F. for sixty days and then subjected to two 1-sec. dips at 10-min. intervals in water at 165° F. The seeds then showed radicle development at an advanced stage and a batch of seed so treated had actually germinated within a few days.

An impressive exhibit displaying methods of vegetative propagation demonstrated the use of various growth-promoting substances in the quick establishment of cuttings. The formation of callus in treated and untreated examples was illustrated, and the methods used in propagation by leaf, root and stem cuttings were also demonstrated. A working mist-unit which automatically maintains a constant humidity in a propagating house was also on view.

The exhibit in the Fernerios was notable for a fine display of young sporophytes of the rare monotypic *Regnellidium diphyllum*, a member of the Marsiliaceae; few students could ever have seen living specimens of this interesting South American genus. In addition, there were examples of the early stages in the development of the fern sporophyte and an interesting demonstration of the vegetative propagation of species of *Selaginella* and *Lycopodium*. These genera, which are difficult or impracticable to raise from spores, are in most cases readily raised from leaf or stem cuttings.

In the Jodrell Laboratory a number of exhibits were displayed to illustrate the multifarious activities of its staff. Besides demonstrations of the methods used in preparing materials for microscopical examination, several examples were shown of commercial vegetable products which had either been adulterated with worthless material or were completely spurious.

Finally, mention should be made of the exhibit shown in the Herbarium, prepared and loaned by the British Council, consisting of forty-four panels illustrating the history and activities of the Royal Botanic Gardens, Kew. Intended primarily for displaying overseas, they were quite excellent in presentation and were universally admired.

often be much ruder and more effective without causing ill-feeling. As a university teacher, Dr. Keynes was concerned at the number of text-books and symposium volumes that bear the names of eminent scientists as editors, but in which the so-called editors have not really done any editing at all. The frequent contradictions in the different chapters are troublesome to student and teacher alike. Editorial interference may be objectionable, but editorial neglect is worse.

Dr. A. S. Parkes (National Institute for Medical Research) agreed that an editor had many responsibilities; but in the long run the author bears the full responsibility for every paper bearing his name. In particular, an editor should not rely too much on a referee, who may well have his own axe to grind, and who, being anonymous, has no right to try to insist on major alterations to someone else's paper. He recognized fully, from his own experience, that young authors can benefit enormously from the constructive criticism of more experienced writers; but papers should go through the moulding stage before they are sent for publication. The head of a department should see that all papers leaving it are in good shape and worthy to bear its name.

Prof. E. J. King (British Postgraduate Medical School) said that manuscripts written by scientists are often very poor, and heads of department cannot be expected to replace the experienced editor in the highly skilled task of revising for publication. Editing is a burdensome job, and most scientists are grateful to the editors who give their time to it. Editors should do as much rewriting as they think necessary. But an editor needs to be a diplomat: he must know how to effect a useful compromise without causing resentment.

Mr. A. L. Bacharach (*J. Nutrition*) said that the basic question is: How much should an editor do? Some scientists are glad to have their manuscripts revised, but others go so far as to assert that papers should appear just as they are written, even complete with grammatical errors. The purpose of publication is to spread new information, and a paper will do this only if the reader has confidence in the author. Grammatical errors, verbosity and repetition undermine the confidence of the reader and should be corrected. It is helpful if manuscripts go through a process of 'internal editing' within a department (not necessarily by the head) before they are sent for publication. In one department that had adopted this procedure for more than fifteen years, only one in some two hundred of the papers sent for publication had been rejected or returned for rewriting. An editor is entitled to make every alteration he thinks necessary to improve the clarity and intelligibility of a paper, so that it can be read with intellectual comfort. Those who resist such alterations are generally the bad scientists—the good ones are glad to have their papers improved.

Dr. R. K. Callow (National Institute for Medical Research) said that a part of the problem is that some scientists are completely blind to typographical, grammatical and logical errors and unable to understand the concern that others feel about them. In his experience, a journal in which an editorial board of scientists did most of the editing, and a staff editor did only sub-editing, achieved the happiest author–editor relationship. It was less satisfactory to have a system of refereeing in which the expression of opinion was limited ('suitable' or 'not suitable' for acceptance) and papers were altered by a staff editor to fit them into a stereotyped scheme for the concise recording of data.

Dr. I. Bush (Oxford) complained of over-zealous editors and laggard referees who hold up publications while making numerous changes, which are not of the first importance, in the manuscripts. Editorial requirements are so numerous and various these days that many otherwise conscientious authors do not take the maximum trouble in preparing their manuscripts since experience leads them to believe that, whatever they do, the editors will always raise a large number of objections or alternatives. He pointed out that Dr. Detlev Bronk had recommended a decrease in 'editorializing' in an article some years ago.

Dr. T. H. Osgood (U.S. Embassy) said that in his American experience, the insensitivity of some authors to shades of meaning lent credibility to the story told by a fellow editor that occasionally his letters of rejection took the form: "Dear Sir, Although your paper fills a much-needed gap in the literature, I regret that it cannot be accepted for publication". It was unfortunate that editors were, on occasion, forced to undertake the education of authors, but when it became known that the correction of errors and the questioning of editorial judgment involved considerable delay, authors took exceptional pains to present good manuscripts. In view of the normal anxiety of an author to see his paper in print, the threat of delay was the best weapon for ensuring the effectiveness of editorial influence. An editor who did his job well must expect to make one or two enemies every year.

Mr. F. Clark (*Biochemical J.*) described the work of a professional editor, whose services may be required for large scientific journals where much of the editorial work formerly done by the chairman and other members of the editorial board can be transferred to the editorial office.

Dr. G. E. W. Wolstenholme (Ciba Foundation) said it is difficult for scientists from abroad to understand the requirements of journals in another country. Some scientists whose papers are rejected are convinced that the editors have a personal grudge against them.

This short meeting had shown how helpful it could be for authors and editors to get to know each other: in that way many mutual difficulties could be ironed out.

THE BRITISH RAYON RESEARCH ASSOCIATION

The annual open days of the British Rayon Research Association's Heald Green Laboratories at Wythenshawe were held during May 11–13. The total attendance was 900. Last year the work on 'fluid beds' and on vibration problems on spinning machinery was not demonstrated, but, because of the progress made, it was possible to give impressive demonstrations of both these aspects this year.

In the 'fluid beds', on which the Association has been working for the past few years, the bed material is small glass beads (dimensions 1 mm.–0·25 mm.) and the fluidizing agent is air. The particular virtues of fluid beds are: (*a*) that high rates of heat transfer can be achieved between a heat source in the bed and the material to be heated, for example, fabric or cord; (*b*) that the bed can be operated at high temperatures; and (*c*) that the temperature is uniform across the bed. Fabric or cord can either be introduced at the bottom and removed from the top of the bed (single-pass bed) or both entry and removal can be at the top (double-pass bed), in which case it is passed round an internal roller or similar device at the bottom. The problem is to achieve this with low cloth tensions. The current position is that fabrics can be passed through single-pass beds under a tension

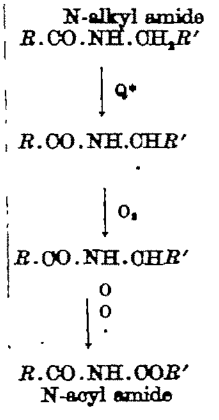
s and ethers:



It has been conclusively shown that N-acyl amides are the primary product for a large range of N-primary alkyl amides. An initial study of the thermal oxidation, over the temperature-range 110–180° C., has shown that the major products from N-ethyl and N-propyl propionamide are again N-acyl amides, that is to say, thermal oxidation would appear to involve a specific hydrogen abstraction, namely from the carbon α to nitrogen, either in the initiation or propagation stage.

The second feature of nylon which has been studied is the structure of spherulites grown from the melt. Narrow-beam X-ray techniques have been used to study orientation, and it has been shown that the a axis of the unit cell lies along the radius in positively birefringent spherulites. The zig-zag extinction pattern shown in the polarizing microscope by some of these spherulites can be understood in terms of this orientation and a structure in which successive crystalline units along a radius show a progressive rotation (twist) around this radius with an optically resolvable pitch. The orientations in negatively birefringent spherulites and in spherulitic aggregates have also been studied. Further work is being carried out by electron microscopy in order to characterize the geometrical nature of the crystalline units from which the spherulites are formed.

An essential stage in the production of textile fibres is drawing, which brings about molecular orientation and an anisotropy in physical properties. Apart from previous work on cellulose film in the Laboratories, no attempts have been made to investigate the anisotropy of the mechanical properties, although the behaviour of fibres under lateral forces may well be as relevant to obtaining an understanding of the physical properties of yarns and fabrics as the axial tensile properties which are usually measured. Using polythene film (see *Nature*, 184, 600; 1959), measurements of the Young's modulus of strips cut at three angles ($\theta = 0°, 45°$ and $90°$) to the symmetry direction (direction of drawing) have been made. With increasing draw ratio at 20° C. the moduli at 0° and 90° to the axis of symmetry first decrease and then increase very markedly. This unexpected behaviour is not explicable in terms of a reduction in order, since density and molecular orientation (by X-ray measurements) increase monotonically with increasing draw ratio. Even more unexpected is the behaviour at $\theta = 45°$. In this case the modulus decreases smoothly as the draw ratio increases. This behaviour of polythene differs markedly from that of cellulose, for which some less-extensive data are available, but it is clearly of sufficient importance to justify the investigation of other polymers in a similar way.

Apart from these investigations, aspects of much other technological work were on show. Of particular interest to the textile industry were the different types of slub-catchers for removing slubs from yarn, a demonstration of the effect of spindle eccentricity on ring spinning frames on producing hairiness in yarns, and the effect of pirn winding tensions and humidity conditions on the production of weft bars in nylon fabrics.

The number of staff of the Laboratories is 230, comprising research staff, 80; laboratory and technical assistants, 57; engineering, drawing office and maintenance staff, 52; library and administrative staff, 32; canteen staff, 9.

L. A. WISEMAN

OCEANOGRAPHY OF LONG ISLAND SOUND

VOL. 17, Art. I, of the *Bulletin of the Bingham Oceanographic Collection** contains six papers on widely different aspects of the oceanography of Long Island Sound, with the emphasis on the cycle of organic production, and a guide for preparing figures written by the editor, Ynge H. Olsen, with James E. Morrow, research associate. The volume opens with an obituary notice of Eugene Harris, who had not fully completed the manuscript of his important contribution on the nitrogen cycle when he died. The senior author, Dr. Gordon A. Riley, completed it, and from the paper itself it is clear to all who wrestle with the problems presented by organic production in the sea that further contributions of high standard would have come from Harris had he lived.

The volume as a whole is a continuation of a series of seasonal studies, continued over a period of years, in the attempt to establish the various parameters, physical, chemical and biological, that seem to exert most influence on the production of plankton, and secondarily on the higher forms of life such as sand-eels and other fishes, in this area. Numerical values for the most important of these parameters having been established, the final approach to solution of the organic cycle is by the mathematical methods previously employed by Dr. Riley in studies of more strictly oceanic areas.

Marine biologists in Great Britain may gain a fair idea of the scope and importance of the work if it is said that it presents a close parallel to that carried out by Dr. Harvey and his co-workers of the Plymouth Laboratory in the coastal waters of the English Channel some twenty-five years ago. Long Island Sound is a more enclosed and more strictly coastal sea-area, with more extreme seasonal variation in such parameters as temperature and salinity, due partly to the climatic differences of an area on the eastern side of a continent. Moreover, the American workers began with all the advantages of the research and discussion that have accrued during the intervening years, with attendant improvements in technique; while the more-sheltered situation must have greatly assisted in the maintenance of wider and more prolonged seasonal coverage.

The general account given by Dr. Riley shows that the phytoplankton cycle is somewhat different from that observed off north-west Europe. A late-winter flowering dominated by diatoms such as *Skeletonema costatum* and *Thalassiosira nordenskiöldii* occurred, with its peak between January and March, in each of the years studied, that is, roughly one month earlier than the spring flowerings studied by European workers. Subsequent less-regular flowerings in May or June consisted predominantly of dinoflagellates. The phytoplankton of the western (enclosed) end of the Sound was so much greater than that near the open end that there the chlorophyll concentrations during post-flowering periods were as high as those representing flowerings at the eastern end. It was thought that relatively low-grazing intensity at the western end partly accounted for this great disparity. Autumnal flowerings were less regular than the others, but of very considerable magnitude. A fairly satisfying argument postulating increased stability of the surface layers as the prime factor promoting the richer autumnal outbursts is presented.

Harris's contribution established nitrogen as the most probable limiting factor among the essential nutrients in this area. As stated in Riley's general account, the relative poverty is shown by nitrogen/phosphate ratio of between 5 : 1 and 8 : 1 by atoms, between one-third and one-half the values found in the Atlantic area generally. It is pleasing to find Cooper's concept of the "anomaly of the phosphate/nitrate ratio" so useful in defining the nutrient characteristics of a region very different from most of those in which such work has been done before.

Harris showed further that ammonia was superior to nitrate and nitrite as a source of nitrogen for the phytoplankton studied in most instances, and not inferior to them in the remainder. In the discussion he developed a most interesting hypothesis to the effect that in strongly stratified surface waters, when nitrogen quantities are near minimal, but organic matter tends to a maximum near the thermocline, vertical zooplankton migrations may help to slow down depletion of the epithalassa in this respect, or even very slightly to increase the quantities available.

Riley and Schurr present a very detailed analysis of the various parameters affecting transparency of the waters as indicated by a fine series of Secchi-disk readings. Here I must confess to feeling rather unconvinced by the mathematical treatment of some of the more obviously inter-related physical factors influencing the maintenance of suspensoids in the upper layers, as wind stress, mean stability, tidal-current speed and depth. The time factor appropriate for the first two seems so uncertain that one doubts the adequacy of the statistically computed partial correlation coefficients to express these. This is not to query the correctness of the conclusions reached, where the possible effects of some of the 'unknowns' are quite fairly stated in more general terms.

A brief trenchant note by Riley on the particulate matter in the Sound shows that although the amount of detritus is exceptionally large its distribution seems to bear little direct relation to the phytoplankton cycle. From the seasonal imbalance between production and consumption it seems that some of it has a slow rate of degradation. Thus it may provide less-suitable food for the zooplankton than would seem probable from the evidence that the latter can assimilate more nitrogen than is to be found in the phytoplankton. The part played by organic detritus in a relatively shallow enclosed sea-area like the Sound, where local turbulence often churns up the bottom deposits, must be more complicated than it is in oceanic areas where it sinks out of the immediate circulation in the surface layers.

Peter J. Wangersky examined the carbohydrate content of water samples from the Sound throughout

s, 3·2–23·1 mm. long.

Comparison with data from elsewhere showed fewer empty stomachs among the Long Island Sound material ; evidently the Sound provides good feeding for the young of this species. Copepods and their nauplii were the most important food organisms, but phytoplankton was also an important food, especially for the younger and smaller larvæ. It is shown that the larvæ must ingest a considerably greater quantity of food a day than can be deduced from direct examination of stomach contents for growth to continue.

Finally, the editors offer first-class advice and instruction regarding the production of the figures with which papers of this kind should be illustrated. No marine biologist can cavil at anything they have to say, for all the advice is excellent.

Is it not a little unjust to expect marine biologists to be good draughtsmen as well as possessing the wide range of professional knowledge and other semi-specialist skills that they must strive to attain in order to do their job well ? Many who are not so gifted are no wit inferior as scientists to those gifted with a natural facility for drawing. The number of research workers who can hope for the collaboration of a good illustrator is very limited, at least in Great Britain. Too much insistence upon a high standard of graphic presentation can thus lead to suppression of valuable results.

Another point which this, in itself unexceptionable, set of instructions impels one to raise is the need in marine biological papers for less size reduction of figures and more reference lines on graphs (which most editors seem to abhor). Such work often involves voluminous raw data, which for economic and other reasons are nowadays rarely published in full. Graphs from which the values really can be read off are therefore almost the last line of defence against destructive critics who make much of possible alternative arrays of the data, which on close examination are almost always found to be inferior to those selected by the individual who did the work.

ization of ethylene sulphide are being investigated for a European sponsor.

The work on the chemistry of sodium sucrates continued and has opened a new route for the preparation of a wide range of sucrose derivatives of potential value, including the sucrose fatty esters, although the problem of removing 'bound' ammonia from sucrates prepared in liquid ammonia has not been completely solved. In the work on the mechanism and kinetics of the formation of isotactic polymers, a new flow apparatus was built and the continuous-flow technique adopted to overcome the difficulty of preparing a reproducible Ziegler catalyst surface, and to afford some insight into the problem of making the polymer production process continuous. An improved model of the viscodensitometer was built and calibrated.

Work in the corrosion field was particularly fruitful, and 450 organic compounds were tested for inhibitory power using the rapid methods described in the previous report. Although the results did not establish any clear-cut correlation between chemical constitution and inhibitory power, they should assist the selection of compounds likely to be effective as inhibitors. Electrochemical methods of studying inhibition have also given interesting results, and the technique of studying inhibition in a flow apparatus with a controlled atmosphere has been considerably improved. Studies of the chemical modification of wood have been extended to include modification of blocks of sapwood specimens and of veneers with the view of assessing improved dimensional stability, and methods have been worked out for the routine evaluation of changes in the physical properties of veneer and whole-wood resulting from chemical modification, and a rapid screening technique for evaluating rot resistance properties of sawdust samples. Infra-red spectroscopy proved to be a particularly valuable method for examining comminuted wood samples.

POLYPEPTIDES OF THE HUMAN PITUITARY WITH DIRECT ACTION ON METABOLISM

By Dr. J. BORNSTEIN and DEIRDRE HYDE
Diabetic and Metabolic Unit, Alfred Hospital, Melbourne

THE observation by Baird and Bornstein[1], that residues of plasma following an acid solvent extract contained a fraction capable of inhibiting the uptake of glucose by rat diaphragm, led to the investigation of the human pituitary as a possible source of this material.

Acetone-dried pituitaries are extracted with a mixture consisting of ethanol, 4 vol.; *n*-butanol, 0·4 vol.; toluene, 0·4 vol.; and water, 1·0 vol.; hydrochloric acid to *p*H 1·5 for 5 hr. The supernatant is discarded, and the wet residue incubated for 4 hr. at 37° C. and then vacuum dried to remove all traces of solvents. The dry cake is pulverized and extracted with 0·1 *M* acetic acid. The extract is then ultrafiltered through 'Cellophane' at 40 lb. per square inch and the ultrafiltrate either freeze dried or precipitated with 15 volumes of absolute ethanol (dried over calcium oxide). The activity of this fraction (*P.U.F.*) is shown in Table 1.

The crude ultrafiltrate was added at a concentration of the equivalent of 1 gland/ml. of buffer.

The ultrafiltrate is then chromatographed on a column of 'Zeokarb 225*H*' or '*IRC* 120*H*', the column being developed with water, 0·1 *M* triethylamine acetate buffer *p*H 6, followed by 0·1 *M* triethylamine buffer *p*H 9·4. Three peaks are observed, the first fraction (HP_1) not absorbing on the column, the second (HP_2) being eluted with buffer *p*H 6 and eluting at *p*H 5·2–6·0 and the third (*BP*) at *p*H 9·4. The third peak (*BP*) has been inert in all systems and no further reference will be made to it. HP_1 and HP_2 showed opposite effects on glucose uptake by rat diaphragm, HP_1 producing acceleration and HP_2 inhibition (Table 2).

Table 1. Effect of Crude Ultrafiltrate on Glucose Uptake by Rat Diaphragm (2)

No. of preparations tested	No. of diaphragms	Glucose uptake in mgm./gm./hr.

6	36	4·54 *S.E.*	3·76 ±0·14	0·78 ±0·066	< 0·001

The inhibitory effect of fraction HP_2 has also been investigated in the following systems.

(*a*) The oxidation of U–^{14}C glucose by paired liver slices (Table 3).

(*b*) The incorporation of carbon-14 amino-acids into protein of rat diaphragm both *in vitro* and following pre-injection of animals.

The diaphragms of rats starved for 18 hr. were incubated in the presence of a protein hydrolysate of activity 1 μc./ml., total amino-acids 80 μgm./ml. and insulin 1 × 10^{-3} unit/ml. No glucose was added. In injection experiments 160 μgm. HP_2 was given subcutaneously 18 hr. before death and 160 μgm. HP_2 intravenously 30 min. before death. Protein was isolated according to the technique of Manchester and Young[4]. The results are shown in Table 4.

(*c*) Effect on the incorporation of ^{14}C-1-acetate into fatty acids and unsaponifiable lipids by liver slices both *in vitro* and following injection.

Liver slices taken from rats starved for 18 hr., paired in the case of *in vitro* experiments, and pooled in injection experiments, were incubated in the presence of ^{14}C-1-acetate 1 μc./ml., acetate concentration 300 μgm./ml., glucose concentration 2 mgm./ml. Where injection of animals was undertaken it was carried out as under *b*. The fatty acids and unsaponifiable lipids were recovered according to the technique of Hastings *et al.*[5]. The results are shown in Table 5.

The unsaponifiable lipids from this series show the same trend as in the *in vitro* studies, but the results are not statistically significant.

be said whether the material is actively diabetogenic in the same sense as growth hormone in suitable animals.

The relation of this apparently polypeptide fraction to the well-known similar effects of growth hormone following the injection of that substance is at present not known, but it is possible that it represents an active fragment split from the growth hormone molecule.

Again it is not possible to state whether this fraction is the same as that described by Baird and Bornstein[1], although there is considerable similarity in the technique of preparation.

Further work as to biological activity, molecular size and structure is in progress, and full details will be published elsewhere.

This work was supported by grants from the Australian National Health and Medical Research Council, Eli Lilly and Company and the Life Officers Fund of Australia and New Zealand.

IMMUNO-E HORETIC DIFFERENTIATION OF HAPTOGLOBINS
FRO ER GROUP-SPECIFIC INHERITABLE SYSTEM
IN NORMAL HUMAN SERA

I, II, etc., according to their electrophoretic positions in immuno-electrophoresis under the conditions employed.

At least two evidently independent group-specific systems have also been observed, whereby normal human sera can be divided into three groups depending on variations in electrophoretic position of the haptoglobin precipitates, as well as three further

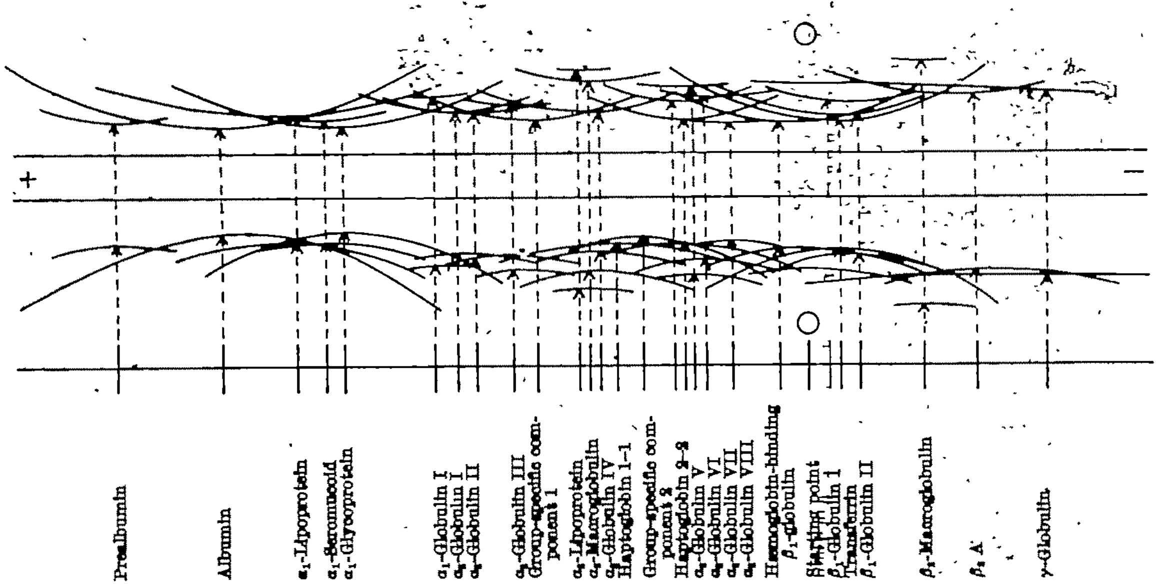

Fig. 1. Schematic representation of immuno-electrophoretic pattern of serum No. 2 (upper basin) and serum No. 4 (lower basin) after previous addition of hæmoglobin developed with different anti-human immune sera

groups depending on other precipitating components occupying different electrophoretic positions in different sera[4].

Both these group-specific systems occur in the α_2-globulin region, as characterized by immuno-electrophoresis, and the homozygotes in both systems have either a fast-moving or a slow-moving component which occupies very close electrophoretic positions. The haptoglobin homozygotes have a slightly slower electrophoretic mobility than the corresponding homozygotes characterizing the other group-specific system. These differences are, however, very subtle. The haptoglobin heterozygote (Hp 2-1) occupies an intermediate electrophoretic position between the Hp 1-1 and 2-2 precipitates, whereas the heterozygote of the other group-specific system gives a precipitate with two peaks if the electrophoretic separation is sufficiently prolonged, the two peaks corresponding to the fast- and slow-moving homozygotes respectively[4].

The haptoglobin precipitates can also be differentiated morphologically from the precipitates formed by the group-specific components, for they present different shapes of precipitate[3,5] and also occupy different positions between the antigen–antibody diffusion centres. Thus the Hp 1-1 precipitate shows an extended shape and is situated close to the antibody diffusion centre, whereas the Hp 2-2 precipitate is normally curved and situated closer to the antigen diffusion centre. The precipitates formed by the group-specific components 1 and 2, on the other hand, are identical with respect to shape of the precipitate (normally curved) and diffusion positions (close to the antibody diffusion centre). Their diffusion position is closer to the antibody diffusion centres than Hp 1-1 and Hp 2-2.

Addition of hæmoglobin will result in a slower migration of the haptoglobins, while the electrophoretic mobilities of other serum components (including the group-specific components) are evidently unaffected (Fig. 2). Also, the haptoglobin precipitates can be stained by means of a benzidine reagent, while no staining is obtained of the other group-specific precipitates if hæmoglobin is added to the sera[3].

By means of agar-gel electrophoresis[6], the electrophoretic position of the haptoglobins can also be localized and compared with the haptoglobin precipitate in immuno-electrophoresis (Fig. 2), whereas as yet no demonstration of the other group-specific components has been obtained with electrophoretic techniques other than immuno-electrophoresis.

It may be difficult to group human sera according to any of the group-specific components because of the number of other precipitating components, especially in the α_2-globulin region, some of which may also vary in different sera[7].

Either an immune serum has to be used, which contains as few precipitating antibodies against other components in the α_2-globulin region as possible, or the immune serum has to be absorbed. Immune sera, which can be used without absorption in haptoglobin grouping or grouping of the other group-specific components in human sera, have been found to be uncommon when rabbits are immunized with whole

dies against these

It has been found that this is the case for most rabbit immune sera immunized with normal human serum, and that such antibodies are also demonstrable in commercially available immune sera (Behring-Werke, No. 1047 and Institut Pasteur No. 13).

The absorption technique employed was first published by Dray and Young[8] but has also been used in our laboratory[3–5]. It will be referred to as intra-basin gel absorption.

All experiments were carried out with the same two sera from evidently normal blood-donors and Fig. 1 also refers to these sera. Serum No. 2 belongs to Hp 2-2 and group-specific component 1 (fast), whereas serum No. 4 is of the type Hp 1-1, group-specific component 2 (slow). Further data of these sera have been given in a previous communication[4]. No changes in these sera have been observed in repeated bleedings of the blood-donors during a period of a year.

In Fig. 1, a schematic drawing is made of the immuno-electrophoretic pattern of these sera when developed with five different immune sera in different experiments. The schematic drawing is believed to demonstrate all components accurately from the original photographs. In this instance, hæmoglobin was added to the sera, which explains the slower electrophoretic position of the haptoglobin precipitates than in Figs. 3–6.

In Fig. 3 the immuno-electrophoretic pattern of these sera is shown when developed with an untreated immune serum which incidentally contained strongly precipitating antibodies only against the haptoglobins and α_2-macroglobulin in the α_2-globulin region.

This immune serum also gives strong precipitates with albumin, transferrin, β_1-globulin 1, γ-globulin as well as another component in the γ-globulin region, which appears only in very fresh sera and disappears after a few weeks, even when sera are stored in the deep-freeze[7] (not included in the diagram).

In Fig. 4, the immuno-electrophoretic pattern of these sera is shown after intra-basin gel absorption with umbilical serum[3–5]. Only the haptoglobin precipitates are shown in the α_2-globulin region.

Intra-basin gel absorption of the immune serum with equal amounts of properdin (1·2 mgm./ml.) and fibrinogen (20 mgm./ml.) gives only the haptoglobins, the group-specific components α_2-macroglobulin as well as α_2-globulin IV, which recently has been identified as the cœruleoplasmin precipitate, in the α_2-globulin region (Fig. 5).

Finally, by means of intra-basin gel absorption with equal amounts of properdin (1·2 mgm./ml.) and albumin (70 mgm./ml.) the group-specific components can be demonstrated, whereas the antibodies against the haptoglobins seem to have been effectively absorbed (Fig. 6).

The serum fractions used were supplied by Kabi, Ltd., Stockholm.

CLEAVAGE OF HUMAN γ-GLOBULIN

By Dr. ROSA AUGUSTIN and BARBARA J. HAYWARD

Wright-Fleming Institute, St. Mary's Hospital Medical School, London, W.2

TWO communications appearing recently in *Nature*[1,2] prompt us to report briefly our own experiences with the 'spontaneous' and enzymatic cleavage of human γ-globulin and other serum components.

During attempts to distinguish reaginic from non-reaginic sera by micro immuno-electrophoresis[3] we observed variations in human sera which were unrelated to allergy. Four out of twenty sera stored at 4° C. for 5–8 years shared a pronounced post-γ-globulin component when tested against antiserum (rabbit) to whole human serum (*R*72) and a further ten sera of this batch had a suggestion of a post γ-globulin line. Out of thirty-four sera stored up to four months at 4° C. only one showed the beginning of a split in the γ-globulin line. Thus, the γ-globulin of serum as well as that of plasma[1] shows evidence of spontaneous splitting during prolonged storage. There were also great variations in the strength of the β_{1M}-globulin line, in the number and positions of the β_1-globulins, the α-globulins and the appearance of a pre-albumin line, most probably identical with Grabar's ρ (ref. 4). Many more sera contained ρ than post-γ-lines, and more sera giving weak β_{1M}-lines had ρ-lines than sera giving strong β_{1M}-lines.

Further, two γ-globulin preparations obtained by fractionating serum on diethylaminoethyl-cellulose[5] originally gave only one line when tested with either rabbit antiserum to whole human serum (*R*72) or with rabbit antiserum specific for γ-globulin only (*R*92). After only a few weeks at 4° C. immuno-electrophoretic patterns showed three partially related γ-globulin components very much like those observed by Grabar[4] and Škvařil[1] in some stored γ-globulin preparations. Like Škvařil[1], we followed up these leads by deliberate proteolytic digestions.

By fractionation on diethylaminoethyl-cellulose we succeeded in preparing immuno-electrophoretically pure water-soluble γ-globulins of a limited range of medium electrophoretic mobilities. These were digested with papain using 1 mgm. of the crystalline enzyme per 100 mgm. of protein. Drops of the digest were removed at intervals and immediately subjected to immuno-electrophoresis. Five- and 17-hr. samples (37° C.) were also dialysed in the cold against distilled water before electrophoresis, but patterns before and after dialysis were identical. Forking at both ends of the γ-globulin line was observed immediately after adding the papain, but a distinct post-γ-line formed rather earlier than the pre-γ-line.

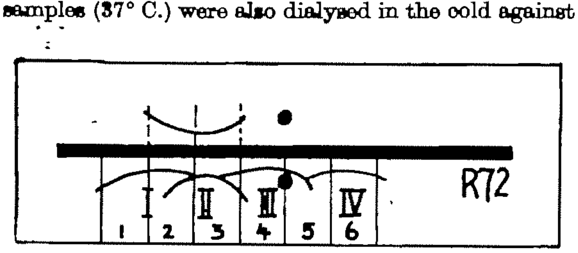

Fig. 1. Immuno-electrophoresis of a human γ-globulin fraction, undigested (top) and digested (bottom). For the Ouchterlony tests in Fig. 2 digests were electrophoresed in both the top and bottom halves; the gel in the top halves was cut into sections as indicated, the immuno-electrophoretic pattern in the bottom half being allowed to develop as usual to provide the key for the cut-out gel sections

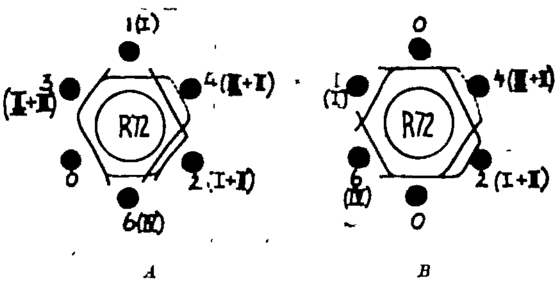

Fig. 2. Ouchterlony patterns obtained with γ-globulin digest fractionated by gel electrophoresis as indicated in Fig. 1. Arabic figures identify the gel sections while the roman figures in the brackets indicate the γ-globulin fraction in the particular gel section as identified by the immuno-electrophoretic pattern in Fig. 1. *O* = original undigested γ-globulin. *R*72 = rabbit antiserum to whole human serum

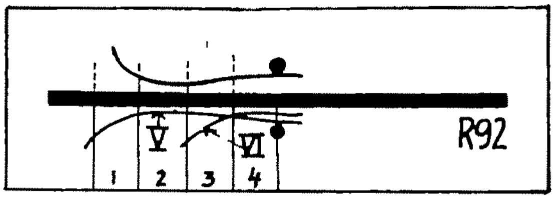

Fig. 3. Immuno-electrophoresis of undigested (top) and digested (bottom) whole human serum. *R*92 = rabbit antiserum to human γ-globulin only. For comparing the split products V and VI with those of Fig. 1, the gel was cut as indicated

There were three distinct components after 1 hr., the amounts of post-γ-globulin line (I) and especially the pre-γ-globulin line (III, Fig. 1) increasing at the expense of II during further digestion. A fourth component (IV) started to appear on the anode side after 4 hr. of digestion; Fig. 1 gives the picture obtained with *R*72 after 17 hr. No component IV could be seen when *R*92 was used to develop the pattern. The upper halves of the gel of three microscope slides were cut into six sections (as indicated in Fig. 1) immediately after finishing the electrophoresis and before the addition of the anti-serum, as in methods described previously[3]. The cut-out gel sections were filled into peripheral cups of Ouchterlony plates as indicated in Fig. 2. From the immuno-electrophoretic patterns it was already clear that both I and III were partially related to II, and that IV was partially related to III. This was confirmed in the Ouchterlony tests (Fig. 2), which further showed complete immunological identity between II and the undigested γ-globulin (Fig. 2*A*), and partial identity of I, III and IV with undigested γ-globulin (Fig. 2*B*). Further, I gave a reaction of non-identity with both III and IV (Fig. 2). Also, it can be seen (Fig. 2*A*) that I

ences (between the digestion of isolated γ-globulin and γ-globulin in whole serum) could be due to our isolated γ-globulins (of a limited range of mobilities) containing more of the determinants *B* and *C* than of *A*, while the amounts of those two sets of determinants may be more nearly equal in the whole γ-globulin range.

A digest of rabbit γ-globulin prepared according to Porter[8] showed no immunological similarities when compared with our digest from human γ-globulin; *R*72, *R*92, a sheep antiserum against whole rabbit antiserum and a rabbit antiserum (*R*89) against an ultracentrifugally enriched macroglobulin fraction (from a Waldenstron patient) were used in the Ouchterlony comparisons.

With normal human sera and with γ-globulin fractions isolated from them, *R*89 gave what looked like three parallel γ-globulin lines, a heavy line flanked by two weak ones. This is reminiscent of the two γ-globulin lines obtained by Goodman[2] with chicken antiserum and whole human serum and may mean that even the purest γ-globulin preparations isolated so far contain components other than γ-globulin, but with identical electrophoretic mobilities.

vailable which were almost certainly acquired locally, and in a court roll there is often a considerable area of unwritten parchment at the junction of membranes from which the required short strip about 1 cm. wide could be taken without spoiling its appearance. In addition, a sample was sometimes taken from the end of a sealing tag. In fact, all the Scottish samples were of this nature. These were supplied by Mr. J. H. Thornton, of Northampton College of Technology, and covered the fifteenth, sixteenth and seventeenth centuries.

The final parchments examined were 164 from the family documents of Captain Sir Hugh Rhys Rankin, Bart., of Bryngwyn, near Kington, Herefordshire. These ranged in date from 1743 to 1871, and all the 60 dated before 1800 were examined; but there were so few remains in the nineteenth century parchments that only three from each decade were examined. Most of this collection were from documents that had been drawn up in Hereford, but there were some from various parts of England and Wales. However, certainly as early as the seventeen-nineties, it was clear that the parchment had not necessarily been made locally; one parchment from Hereford, in fact, bore the name of a London stationer.

The parchments were treated in the following way: Sandison's softening fluid[3], 24 hr.; 70 per cent alcohol, 3 hr.; 90 per cent alcohol, 3 hr.; absolute alcohol, 5 min.; carbolic xylol (phenol 25 gm.,

xylol 75 ml.), overnight, and then wax embedded *in vacuo* for 30 min. They were sectioned horizontally, that is, parallel to the original skin surface, and stained with sacpic stain[4].

Only one sample had a clear follicle grouping, whereas four of the Dead Sea Scroll samples[1] had clear groups. Even those with many well-preserved follicles or fibres did not show the follicle arrangement. The remains in the medieval parchments were on the whole less well preserved than those in the Dead Sea Scroll parchments, possibly owing to the wetter British climate, although many of the medieval parchments were of excellent quality. The seventeenth- and eighteenth-century parchments were on the whole of the worst quality, being the thickest, but showed most histological detail, for example, cell nuclei in follicle bulbs and surface scale patterns on the wool fibres. The nineteenth-century parchments were the thinnest, and contained the least number of remains.

The results are summarized in Table 1. Identification presented great difficulty because it had to be based mainly on individual follicles and fibres. The main criterion was the diameter of fibres and follicles, resulting in descriptions as fine, medium, and fine to medium wool, which gave no indication of breed. Sometimes, however, further information could be obtained from indications of follicle grouping and fibre-scale pattern, and suggestions of type, for example, down or long-wool, were added. A further difficulty was the likelihood that sheep of the past differed from those of to-day; for example, the mention of down sheep means that the sample had the appearance of this type, and not necessarily that the down type existed at that date. Hairy sheep were easily distinguished because of the presence of both coarse and fine fibres, the latter having a large latticed medulla (Fig. 1). They were distinguished

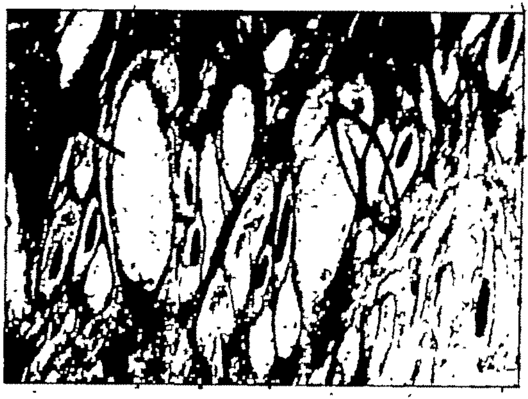

Fig. 1. Parchment, from hairy sheep; note coarse fibre with latticed medulla displaced from primary follicle, and fine fibres in secondary follicles. × 55

Hairy sheep were apparently present in all periods, whereas most of the fine-wool samples came from the medieval period, and most of the medium-wool samples came from the sixteenth century onward, those of the eighteenth century being the coarsest. The findings therefore support historical records which mention the extreme fineness of medieval wool, and also work which has shown evidence of an increased supply of long wool during the sixteenth- and seventeenth centuries[6]. There was evidence, however, of the existence of medium and fine-to-medium wool sheep in the Middle Ages that could have been the ancestors of the long-wool, the origin of which has recently been much discussed[6-8]. It is interesting that a suggestion of Soay sheep was found in Scotland, because it had been thought that the Soay type was widespread there until the eighteenth century.

I wish to thank all those mentioned earlier who provided the material for this work, which was carried out while I was a member of the staff of the Wool Industries Research Association, Leeds. I am grateful to Miss R. G. Jasper for technical assistance.

spinal cord is not slower in the new-born animal than in the adult.

It will here be shown that both the peripheral conduction and the central transmission of proprioceptive hind-limb reflexes are slower in the new-born kitten than in the adult animal, until the kitten reaches the age when it can walk and stand on its hind-legs. Furthermore, it is concluded for several reasons that the spinal transmission of proprioceptive reflexes is monosynaptic.

Experiments have been performed on kittens from 60 different litters, most of them ranging in age from 1 to 45 days. They were either decerebrated and spinalized or anæsthetized with nembutal intraperitoneally (35 mgm./kgm. body-weight). Various hind-limb nerves were dissected free for stimulation and recording, and after laminectomy either all dorsal or all ventral roots from *LII* and downwards were severed for recording or stimulation. This preparation has been used both for determining the velocity of conduction and the spinal transmission of proprioceptive reflexes as well as their reaction to antidromic and tetanic stimulation, and their facilitation and inhibition. Furthermore, the Renshaw feedback and the impulse-flow from sense organs in the muscle have been studied. Here only the development of the time relationships in the proprioceptive hind-limb reflexes will be considered.

At birth, the velocity of conduction of the fastest muscle afferents varies in different litters and animals from 8 to 12 m./sec., which means a time of conduction of around 3–4 m./sec. from, say, the gastrocnemius muscle to the spinal cord, the distance varying from 3·5 to 4·5 cm. When the kitten is well able to support its body-weight on the hind-legs, the velocity of conduction of the fastest muscle afferents has increased to about 30 m./sec. At the same time the distance has increased to 5–8 cm. from the gastrocnemius, which means a time of conduction of around 3 msec. This velocity of conduction is normally attained at an age of 18–25 days postnatally.

The ventral roots and muscle efferents are developed earlier than the dorsal roots and muscle afferents, having a velocity of conduction that is 2 m./sec. faster in the new-born animal. When the efferents have achieved a velocity of about 30 m./sec., there appears a later wave in the neurogram on stimulation at ten times threshold for the biggest efferents. This wave has been found to correspond to the gamma-efferents in the adult nerve.

On stimulating a muscle nerve or a dorsal root and recording on the central end of the cut ventral root, a rather synchronous potential is obtained in the new-born kitten (Fig. 1). With increasing age the reflex time is seen to diminish, so that, at a velocity of peripheral conduction of 30 m./sec., it is about the same as that of the monosynaptic potential in the adult animal[5-7]. Such a long reflex time as that in the new-born kitten does not immediately suggest that it is mediated by a two-neuron arc. The flexor behaviour of the animal[8] suggests rather that the reflex is polysynaptic and directed to the flexors. This possibility can be immediately ruled out, for on stimulating the dorsal roots and recording on the muscle nerves, or both stimulating and recording on the muscle nerve, a reflex with the same central delay can be recorded on both extensor and flexor nerves. Thus, so far its identity with the monosynaptic reflex is clear. In Fig. 2 the reflex time on stimulating the dorsal and recording on the ventral root has been plotted against velocity of conduction in the muscle afferents (circles). Subtracting the time of conduction in the dorsal and ventral roots gives the curve with half-filled circles. Measurements on spinal cord sections in a new-born kitten have shown that the intraspinal conduction path to the ventral horn cells amounts to 2 mm. in *S* 1. Plotting the time of conduction in the dorsal root collaterals kept at a constant length of 2 mm. against velocity of conduction in the muscle afferents, the velocity of intraspinal conduction being assumed to be a third of that for the adult animal gives the filled circles. From these curves is seen that, with a synaptic delay of 0·5–0·8 m./sec.[9], there would be no time for more than one synapse. The velocity of conduction in the thin dorsal root collaterals might be even slower in the new-born kitten than the calculated value, and the conduction path is somewhat longer than 2 mm. at the later stages of development, which would shift the filled circles to the right, as the time of intraspinal conduction from the ventral horn cells to the surface of the cord, here not calculated, will do. It is thus concluded that the reflex is mediated by arcs of two neurons already in the new-born animal, the long reflex-time being due to the slow velocity of conduction, although a somewhat longer synaptic delay than in the adult animal might be at hand.

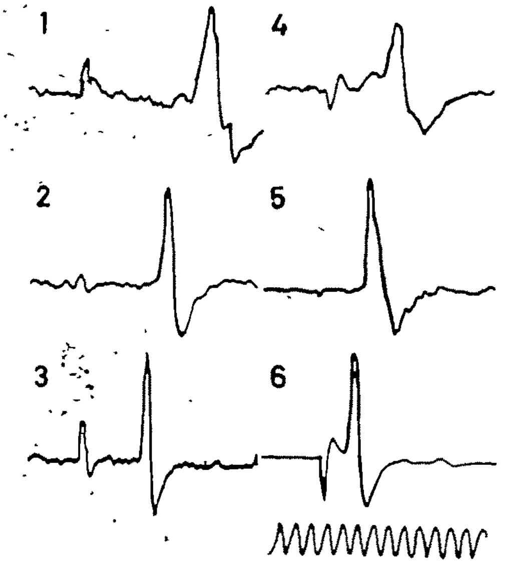

Fig. 1. Reflex potential recorded on the central end of the cut ventral root in three different experiments, (1), (2), (3), on stimulation of the gastrocnemius nerve in the popliteal fossa, afferent nerve path 4 7 cm., 5 4 cm. and 6·8 cm., respectively; (4), (5), (6), on stimulation of the cut dorsal root *S* 1, (1) and (4) from 1-day old kitten, (2) and (5) from 12-day old kitten, (3) and (6) from 28-day old kitten. Time, 1,000 c./sec. Note shock artefacts appearing one under the other

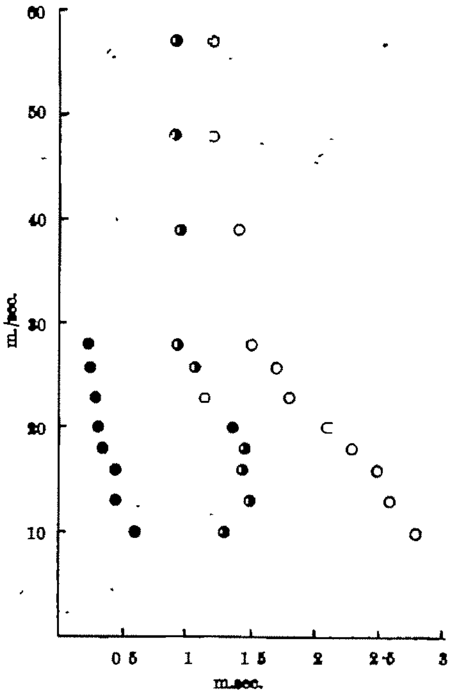

Fig. 2. Reflex-time on stimulation of the dorsal root and recording on the ventral root *S* 1 plotted against the velocity of conduction of the muscle afferents in 11 experiments (circles). The central reflex-time plotted against velocity of conduction of the muscle afferents in the same 11 experiments (half-filled circles). Time for dorsal root collateral conduction plotted against velocity of conduction of the muscle afferents up to 28 m./sec. (filled circles). For further explanation see text

the potential being restored somewhat earlier (see Fig. 1).

With advancing age the increase of latency after tetanization, as well as the time required before latency and the height of the potential have resumed their control value, diminish. When the velocity of peripheral conduction has exceeded 20 m./sec., the first signs of a post-tetanic potentiation appear in response to a short tetanus, a long tetanus still setting up an increase of latency and diminution of the potential for quite a considerable time.

Post-tetanic potentiation is well developed when the conduction velocity of the muscle afferents has reached 30 m./sec. 18–25 days postnatally. At this stage of development short tetani also give facilitation of potentiation[1].

These experiments have provided information on the postnatal development of the dorsal root collaterals and events concerned with post-tetanic potentiation. Here, however, I wish to stress only the simultaneous development of post-tetanic potentiation and other adult features of the monosynaptic pathway on one hand, and decerebrate rigidity and tonic stretch reflexes[7,8] on the other.

PHYSICS

Effect of Specular Reflexions on the Radiation Flux from a Heated Tube

A QUESTION of some importance that arises in problems of radiational transfer of energy in an enclosure is this: If ε is the emissivity, and hence also the absorptivity, of the surface, in what manner is the fraction $(1 - \varepsilon)$ of the incident radiation that is not absorbed returned to the enclosure? In most investigations on the radiation from the inside of a uniformly heated cylinder it is assumed that the whole of this fraction is diffusely radiated according to the cosine law[1]. The alternative case where the whole of this fraction is specularly reflected does not seem to have been investigated. This case also is of interest, since it can be secured in practice by suitably polishing the wall surface, and secondly since it lends itself to a more precise and elegant theoretical treatment than the corresponding case of perfectly diffuse reflexion.

Consider, for example, the flux of radiation that issues from the mouth of a cylinder, open at both ends, the temperature of which is kept uniform over its whole length. In order to evaluate the flux one may adopt a method somewhat similar to that used by Berman, Simon and Ziman[2] for calculating the effect of specular reflexions of thermal phonons of long free path from the walls of a cylindrical crystal on its thermal conductivity at low temperatures—though these authors were concerned, unlike here, with transport of energy under a gradient in temperature. The flux can be readily shown to be equal to:

$$F_L = \sigma T^4 \sum_{r=0}^{\infty} \varepsilon^2 (1 - \varepsilon)^r \int_0^L \mu\left(\frac{h}{r+1}\right) dh \qquad (1)$$

where:

$$\mu(h) = \pi\left[h - \frac{2h^2 + D^2}{2(h^2 + D^2)^{1/2}}\right] \qquad (2)$$

σ being Stefan's constant, L the length of the tube and D its internal diameter.

When the tube is long, that is, when $L \rightarrow \infty$, the expression for the flux reduces to:

$$F_\infty = \sigma T^4 \varphi(\varepsilon) \int_0^\infty \mu(h') dh' \qquad (3)$$

where:

$$\varphi(\varepsilon) = \sum_{r=0}^{\infty} \varepsilon^2 (1 - \varepsilon)^r (r + 1) \qquad (4)$$

is the factor by which the corresponding expression for the ideal case when the walls of the tube are black has to be multiplied in order to take into account the defect of actual ε from unity and the consequent occurrence of specular reflexions.

It can be readily seen that:

$$\varphi(\varepsilon) = \varepsilon^2[1 + 2(1 - \varepsilon) + 3(1 - \varepsilon)^2 + \ldots] = 1 \qquad (5)$$

That $\varphi(\varepsilon)$ is independent of ε and is equal to unity, as though the direct radiations only were involved and they corresponded to those of a black body, is significant. It can be further seen that $\int_0^\infty \mu(h) dh = \frac{1}{4}\pi D^2$, which is just the area S of the mouth of the tube, and that $F_\infty = S\sigma T^4$, which is just the radiation that one would expect from a black body of this area.

The equivalence of the flux from the mouth of the cylinder to the radiation from a black surface holds for all directions over the 2π solid angle.

When the other end of the tube is closed, the flux from the mouth includes, in addition to F_L, two more terms, F_L' and F_L'', relating to the radiations that originate from the side walls and are reflected from the end wall, and those that originate from the end wall, respectively:

$$F'_L = \sigma T^4 \sum_{r=0}^{\infty} \varepsilon^2 (1 - \varepsilon)^{r+1} \int_L^{2L} \mu\left(\frac{h}{r+1}\right) dh \qquad (6)$$

$$F_L'' = \sigma T^4 \sum_{r=0} \varepsilon^2 (1 - \varepsilon)^r \xi\left(\frac{L}{r+1}\right) \qquad (7)$$

where:

$$\xi(L) = \frac{1}{4}\pi[2L^2 + D^2 - 2L(L^2 + D^2)^{1/2}] \qquad (8)$$

With $\varepsilon = 0{\cdot}75$, the flux issuing from the mouth of a tube of length $5D$, closed at the other end, is short of that from a black body by about 1 per cent. In the alternative case of perfectly diffuse reflexion, even though the flux along some directions may approximate even more closely to that from a black surface, the total flux over all directions is considerably short of it, and remains so however much the cylinder may be extended.

Gamma Irradiation of Lead Silicate Glass

GLASSES exposed to gamma radiation darken due to the trapping of electrons in defects. Much work has been done by Seitz and others on colour centres produced in alkali halides by irradiation. Glass has also been studied by many workers, and it is well known that the intensity of the colour produced in glass fades in the dark and that this process is accelerated by increase in temperature or by exposing the glass to light. The present work was undertaken to investigate the mechanism involved in the darkening of glass, and the recovery in the dark with time, in an attempt to obtain better understanding of the structure of glass. A lead silicate glass of weight percentage composition PbO–80, SiO_2–20 was chosen because of the simplicity of its chemical composition (approximately $PbO.SiO_2$). Such glass might be expected to provide a simple absorption spectrum after irradiation. Rectangular blocks of glass 1 cm. × 1 cm. × 3 cm. cut from a single

ptical density with time
iation for a dose of 10^{8}

rads. The optical density decreased rapidly immediately after removal from the radiation facility, and the rate of fading became smaller as time progressed. Similar curves obtained for other doses within the range studied had the same form.

The effect of increasing dose on optical density at different wave-lengths after certain periods of fading was studied. It was found that as the glass was irradiated, the number of colour centres increased rapidly at first with increasing dose, apparently approaching a saturation value. Complete saturation was not achieved, however, since for doses higher than 10^{6} rads the variation between optical density and dose was linear. The explanation suggested for this is that there are two processes involved: trapping of electrons in defects existing in the glass prior to irradiation; and creation of defects of the same type during irradiation. These induced defects can then trap electrons to produce the same type of colour centre. The filling up of defects already existing is complete at about $10^{5\cdot5}$ rads, but there is no evidence to suggest departure from non-linearity between the concentration of induced defects and dose up to 10^{8} rads.

The absorption spectra of the irradiated samples show three absorption bands at approximately 1·7 eV., 2·3 eV., and 3·3 eV. If it is assumed that these absorption bands are Gaussian in shape, it is possible to separate the full absorption curve into three component parts shown as dotted lines in Fig. 2. Further work is in progress and will be reported elsewhere.

Ultrasonic Velocities in Aqueous Electrolyte Solutions

IN a recent communication, Mr. S. V. Subrahmaniam[1] has reported measurements of ultrasonic velocities in aqueous solutions of cadmium iodide and mercuric chloride. I have made a detailed investigation of the variation of ultrasonic velocities in a number of aqueous solutions of electrolytes with concentration and temperature. The electrolytes that show the rather unusual behaviour of decreasing sound velocity with increasing concentration are the following: (1) cadmium bromide, (2) cadmium iodide, (3) zinc iodide, (4) strontium iodide, (5) lead acetate, (6) uranyl chloride, and (7) uranyl nitrate. The detailed results were published[2,3]; the conclusions reached in those studies are as follows:

(1) While in general sound velocities in electrolyte solutions are greater than that of water and increase with increasing concentration at all temperatures the experiments on the above-mentioned electrolytes reveal the opposite type of behaviour, that is, a decrease in sound velocity with increasing concentration, the values being always less than that of water.

(2) It is also a striking feature that the velocity decrease is always associated with the presence of heavy ions like Pb^{++}, I^{-}, U^{++}, etc., so it is probable that a correlation exists between the two factors. It

as been suggested by Barthel[4] that in the case of eavy ions the velocity of Brownian motion is much ess and this may result in a decrease in velocity, Brownian motion being regarded as one of the factors hat contribute to the sound velocity.

(3) It is noteworthy, however, that the adiabatic ompressibilities are quite normal in all these cases, eing always less than that of water at all concenrations and temperatures.

(4) One more striking feature is that in spite of the nomalous variation in sound velocity a linear variaion of apparent molar compressibility with square oot of concentration is found in all cases as predicted by the Debye–Hückel theory.

(5) The slopes of the apparent molar compressibility versus square root of concentration curves and the values of apparent molar compressibility at infinite dilution do not show any marked correlation with decrease in velocity with increasing concentration.

(6) On the other hand, these properties seem to be related more to the state of dissociation of the electrolytes and the existence of complex ions.

The above work was carried out at the Indian Institute of Science, Bangalore, India, under the direction of Prof. R. S. Krishnan, head of the Physics Department, and I thank him for his kind interest and encouragement.

Perceptual Anomalies associated with a Single Contour

In the course of an investigation into the basis of 'complementary images'[1] evoked by patterns of near-parallel lines, I have observed some striking phenomena which, together with some confirmatory tests that they suggested, indicate that a single contour can be sufficient to excite a complementary image.

Two 300-W. projectors were focused on a screen at a distance of 1 metre. One of these, *A*, projected a plain bright field, while the other, *B*, projected a bright field with a black disk 10 cm. in diameter in the centre. By means of a rotating circular mask with two 10° apertures on opposite sides, these images were presented alternately, at intervals *AB* and *BA*, which could be varied by raising and lowering the axis of the mask. When the time-interval *AB* was about 30 per cent of the total cycle the following phenomena were observed. (1) Fine radial spokes extended about 2 cm. inwards from the edge of the dark disk. These were sharpest and brightest at the circumference, becoming more diffuse towards the centre. There were about 40 of them when viewed at 1 metre; (2) the disk appeared to be in continuous rotation of variable speed; (3) the disk gave the impression of slow continuous expansion; (4) the background was rather brighter and the disk considerably darker in the neighbourhood of the edge.

When the interval *AB* was 50 per cent of the cycle: (1) the radial effects were broader in appearance; (2) rotation was seen as before; (3) the disk remained constant in size; (4) the disk again appeared dark, but there were no variations in brightness towards the edge.

When the time-interval *AB* was increased to 70 per cent of the cycle: (1 The strongest radial effects were now on the outside of the disk and were described by most observers as spiky, but the disk showed diffuse internal rays. Again when viewed at 1 metre the effects extended about 2 cm. from the edge; (2) rotation was seen as before; (3) the disk now gave a compelling impression of continuous contraction; (4) the background was much brighter in the neighbourhood of the edge whereas the disk appeared uniform and considerably brighter than previously and was olive in hue.

With simultaneous presentation of *A* and *B* the disk was again of an olive shade and both this and its background appeared much brighter than in the other cases. Pattern and movement, however, were scarcely visible.

In all cases Fechner colours and 'stroboscopic' patterns[2] associated with flashing light (but unrelated to the pattern of the disk) were frequently noticed.

The phenomena were strongest for frequencies in the range of 15–25 cycles per sec. but persisted to some extent through the range of 5–40 cycles per sec.

Corresponding effects were observed using a bright disk on a dark ground and using a single straight edge, and again when a negative of the disk pattern was substituted for the plain field.

The effects were the same whether one or two eyes were used. The presentation of the plain field to one eye and the disk to the other, however, gave no comparable results.

In view of the apparent relation between these phenomena and the complementary image, a series of tests were undertaken to find out whether other methods used to evoke complementary images[1] might also be effective with a single circular contour.

As might have been expected, no convincing complementary pattern was seen as an after-image, though a few subjects have reported a very faint radial pattern. A more effective technique was found in altering the pattern brightness cyclically about once per sec., when at times a radial pattern could be seen clearly.

Simple stroboscopic illumination was also found to give unconvincing results with a single contour. When, however, flashing light was superimposed on a bright continuous image, corrugations could be seen on the darker side of the contour.

The movement seen in spatio-temporally random visual 'noise'[1] appeared more organized at the contour, although this effect was not comparable in magnitude to that produced by patterns of many lines.

Double flash stimulation of the type described above has also been found more effective in producing vivid and continuous complementary images of more complex patterns. The reason for this is not yet understood. It seems, however, that any theory of the complementary image must now account for its production at a single contour.

1·46 cm.⁻¹ for ε for water at 185 mμ at 25° C. is higher than the previously reported value of 1·2 cm.⁻¹ (ref. 8). This we consider to be due to the greater accuracy of the method and to the substantial correction for scattered light at this wave-length. The values for the absorption coefficients of H_2O, HDO and D_2O will be of use in the interpretation of results of photochemical investigations of systems containing these species.

The observed dependence on temperature has been noted by Golding[6]. We have investigated this effect in several systems in which hydrogen-bonding is known to be present.

We have found that the dependence on temperature in such systems is much more pronounced than in those where hydrogen-bonding is not present, as the following typical results show:

Absorbing molecule	λ(mμ)	T° C.	D (1 cm.)
Methanol	220	3	0·186
Methanol	220	25	0·253
Hexane	220	3	0·120
Hexane	220	25	0·140
Carbon tetrachloride	260	3	0·76
Carbon tetrachloride	260	25	0·92

We consider that the effect of temperature on the reported spectra can be interpreted in terms of the degree of hydrogen-bonding present. The presence of such bonds may lower the transition probability of the optical electrons.

M. Ito[9] has discussed a similar effect in the spectra of organic molecules.

Drs. Barrett and Mansell imply that the ultra-violet absorption spectra of water reported by me[1] were due to failure to flush the optical path by oxygen-free nitrogen.

The normal spectrophotometric precautions for work in this difficult region were observed. The sample space and detector optics of the Beckman *DK2* were scavenged with dry oxygen-free nitrogen. The monochromator of the instrument involves only one beam path, and the double-beam chopping is external to this unit. This monochromator is factory-sealed, and was not flushed with nitrogen. The effects of stray light, scattered light and band-width were investigated.

Stray light (inherent in the instrument) and scattered light (inherent in the solvent) may be ignored (less than 1 per cent) below the following readings of optical density:

Wave-length	186 mμ	188 mμ	190 mμ	195 mμ
Maximum optical density for error < 1 per cent	0·5	0·6	1·2	2·0

The band-width can be kept to less than 0·3 mμ down to 185 mμ. By partially closing the sample shutter (equivalent to a fixed absorption), the deviation at the extreme end of the instrument from the fixed optical density reading can give a measure of the stray light figures, which are very dependent on the slit-widths as shown at 185 mμ.

Band-width	0·35 mμ	0·42 mμ	0·52 mμ	0·7 mμ
Percentage stray light	1	6	14	30

Flushing the instrument with dry nitrogen and bubbling nitrogen or hydrogen through the water sample for 12 hr. made no visible alterations to the spectrum. Reversing the sample and reference cells produced an exact mirror image of the spectrum. The spectrum did not come from the matched cells, since heating the reference cell to about 70° C. also had no effect on the spectrum. These precautions show that the water spectrum was real and not inherent in the Beckman *DK2* or in the various gases in the water and the instrument.

The water spectrum was shown to obey Beer's law by varying the path-length using a number of cells.

Path-length (cm.)	Optical densities		
	188·0 mμ	189·5 mμ	191·0 mμ
1	0·260	0·230	1·180
2	0·520	0·460	0·360
3	—	0·690	0·540

Concentrated sulphuric acid has no peaks in this region, and on adding water to the acid the water peaks suddenly appear.

In an experiment, two matched cells filled with water were placed in sample and reference beams, and the instrument gave a straight I_0 line. When solutes were added to the sample cell, the reported water spectrum[1] appeared, promoted by the presence of solute. This cannot be due to an instrument characteristic.

An extensive investigation of the Beckman *DK2* double-beam spectrophotometer suggests that the water spectrum at 190 mμ is real. A more detailed paper will be published shortly interpreting the results.

CRYSTALLOGRAPHY

Crystal Structure of 9 : 10-Dimethyl-1 : 2-benzanthracene

As part of an investigation into Daudel and Pullman's theory[1] of the connexion between the carcinogenic activity of benzanthracene derivatives and their structure, we have made an accurate determination of the crystal structure of 9 : 10-dimethyl-1 : 2-benzanthracene. It is a potent carcinogen, unlike its parent, 1 : 2-benzanthracene, the structure of which we have reported previously[2].

All X-ray data were collected from a good crystal, about 0·3 mm. on an edge, grown by cooling from amyl acetate. Basic data are: $a = 7 \cdot 62$ Å., $b = 8 \cdot 62$, $c = 21 \cdot 11$, space group $P2_1nb$, $Z = 4$ molecules/cell, $d_{\text{calc.}} = 1 \cdot 23$. (The alternative space group *Pmnb* would lead to an impossibly high density unless all atoms lay in the planes $x = 1/4, 3/4$; this would cause the $0kl$, $2kl$, $4kl$, . . . reflexions to be essentially identical, and the $1kl$, $3kl$, $5kl$, . . . likewise. In fact these reflexions are similar but not identical.) Of the 1,647 independent reflexions observable with copper $K\alpha$ radiation, 347 were photometered from integrated Weissenberg photographs, 1,134 were estimated by eye from ordinary Weissenberg photographs, and the remaining 166, which were too weak to measure, were given intensities of half the minimum that could have been measured. No corrections for absorption were made.

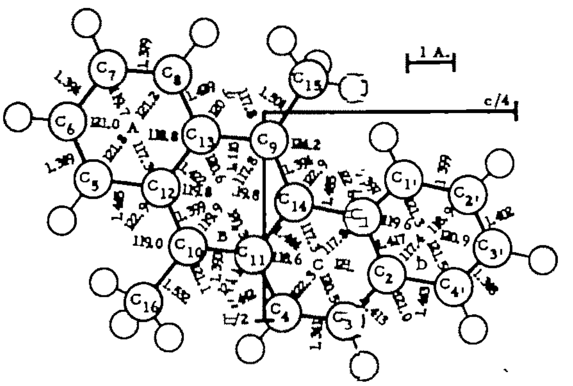

Fig. 1. The a-axis projection of 9 : 10-dimethyl-1 : 2-benzanthracene. The numbers give 3-dimensional bond-lengths and angles

The approximate structure was found from considerations of packing and by fitting a few critical reflexions. The refinement was done by least squares, using the programme *NY XR*1 on the *IBM* 704 to minimize the function $R' = \Sigma w_H (F_H^{\text{obs.}} - K'|F_H^{\text{calc.}}|)^2$. All 1,647 reflexions were included. The weights w_H were set equal to min. $(1, 100/F_H^{\text{obs.}2})$. The parameters refined were K', plus x, y, z, and B for each of the 20 carbon atoms. The hydrogen atoms were included, but were simply moved in conformity with the carbon skeleton. Table 1 and Fig. 1 show the results. The final values of the conventional discrepancy R and R' were 13·5 per cent and 1,261. The average standard deviations for atom position, C—C bond-length, C—C—C bond-angle, and temperature factor B are 0·003 Å., 0·011 Å., 1·2° and 0·14 Å.^{2}.

If the bond-lengths of the 23 C—C bonds are converted into bond orders by the use of Pauling's curve, it is found that they range from order 1·01, for the

to the conclusion that
r molecules are disso-

ciated, their tetrahedral character is lost, and the protons lie midway between the oxygen ions. These conclusions are not in harmony with modern ideas on the nature of molecular structure and of intermolecular forces.

We have built equipment for making the high-pressure ice polymorphs and extracting them for X-ray study, utilizing Tammann's discovery that these substances can be held metastably at atmospheric pressure if maintained at liquid-nitrogen temperature. A small sample of water is confined in a cylindrical chamber closed by movable pistons and loaded by means of a hydraulic press. The temperature and pressure of the sample and its volume can be measured, and the phase transitions observed directly as discrete changes in volume. The press can then be submerged in liquid nitrogen, and the sample expelled, by means of the hydraulic press, into a liquid-nitrogen bath.

From samples prepared in this way we have obtained both X-ray powder diffraction and single-crystal data. The samples under X-ray examination were cooled continuously in a stream of nitrogen gas at − 190° C.

Our powder data for ice II and ice III disagree with McFarlan's data for the same substances. Our data for ice III are in fairly good agreement with McFarlan's data for ice II, for the larger spacings, whereas our data for ice II correspond to neither of McFarlan's sets of powder data. Because of these disagreements, we have checked carefully the identification of our ice II and ice III samples. They satisfy all the conditions of formation, stability and metastability given by Tammann and Bridgman (with the exception of the fact that our ice II does not, in experiments to date, transform rapidly to ice V on rising temperature). We have so far found no polymorph giving powder data in agreement with McFarlan's data for ice II.

Single-crystal data for ice III show that this polymorph is dimensionally cubic but symmetrically tetragonal, with $a \simeq c = 6{\cdot}80$ Å. The space group is $P\,4_12_12$. The density calculated on the basis of 12 molecules in the unit cell is $1{\cdot}14_1$ gm.cm.$^{-3}$, in satisfactory agreement with the value $1{\cdot}13_6$ gm.cm.$^{-3}$ obtained by extrapolating to zero pressure the ice III density values determined by Bridgman over the range 2,000–3,500 atmospheres, and correcting for thermal contraction by assuming that the average thermal expansion coefficient of ice III is the same as that of ice I over the temperature-range −20° to −190° C. Consistent with the space group and density, no other number of molecules in the cell is possible.

On rotation and precession photographs, the intensities of 45 separate reflexions have been measured, in the region $\sin\theta/\lambda < 0{\cdot}5$ Å.$^{-1}$. In addition, 13 intensities on rotation photographs correspond to superimposed pairs of reflexions, the separate intensities of which cannot be assigned without upper-level precession data not at present available. 61 additional reflexions in the region $\sin\theta/\lambda < 0{\cdot}5$ Å.$^{-1}$ have intensities too faint to observe.

It is possible to build a reasonable structure for ice III by placing 8 oxygen atoms in general positions and 4 oxygen atoms in special positions, as follows:

$$8\ O_{\text{I}} \text{ in } 8a:\ x, y, z;\ \ldots;\ \text{with } x_{\text{I}} = 0{\cdot}095,\ y_{\text{I}} = 0{\cdot}30,\ z_{\text{I}} = 0{\cdot}29$$

$$4\ O_{\text{II}} \text{ in } 4b:\ x, x, 0;\ \ldots:\ \text{with } x_{\text{II}} = 0{\cdot}392$$

The x and y parameters were also derived independently from the $hk0$ Patterson projection (13 independent reflexions only), and refined roughly by means of the (001) Fourier projection. Without systematic refinement of the parameters on the basis of the three-dimensional data, the overall agreement of calculated and observed intensities is good enough to indicate that the structure is correct. The residual $R = \Sigma|\sqrt{|F_o|^2} - \sqrt{|F_c|^2}|/\Sigma\sqrt{|F_o|^2}$ is 0·26 for the 45 observed reflexions. The calculated intensities of 13 reflexions chosen at random from among those unobserved are all weaker than the limit of observation.

In the ice III structure, each oxygen atom is surrounded by four others at distances of 2·73–2·90 Å., and the co-ordination polyhedra are approximately tetrahedral. The O_I oxygen atoms form fourfold spirals parallel to the c-axis. These spirals are linked together by the O_{II} atoms, each of which forms bonds to O_I atoms in four separate spirals. The arrangement is satisfactorily interpreted in terms of hydrogen-bonding, and the tetrahedral character of the water molecule is approximately retained, no hydrogen bond deviating by more than 15° from a tetrahedral direction.

The arrangement of oxygen atoms in ice III is very similar to that of the silicon atoms in silica K (keatite), a recently discovered[4] high-pressure polymorph of SiO_2. It is interesting, and certainly not unexpected, that the structural relationship between the silica and ice polymorphs, already known for ice I—tridymite and ice Ic—cristobalite, should be found to extend to the high-pressure forms. The tendency for the Si—O—Si bond angle in the silica polymorphs to be about 140° should, however, lead to a destabilization of the corresponding ice polymorphs, in which the hydrogen bonds would be correspondingly bent.

This work has been supported by the National Science Foundation. The detailed experimental methods and results will be published elsewhere.

CHEMISTRY

Excited Electronic States of Lithium and Sodium Molecules

THE electronic spectra of the alkali metal molecules are of interest for several reasons: for example, (1) Li_2 is sufficiently simple to be the subject of quantitative wave-mechanical calculations[1,2], and (2) these spectra may be expected to be somewhat similar to that of H_2, for which reliable analyses of many systems are now available[3,4]. Furthermore, the excited singlet *ungerade* states of the alkali metals are readily accessible, since they may be observed in combination with the ground states at $\lambda > 2300$ Å. It is therefore surprising that for Li_2 and Na_2 only the lowest excited singlet states, $A\ ^1\Sigma^+_u$ and $B\ ^1\Pi_u$, have been well characterized[5]: several systems at shorter wave-lengths have been reported[5,6], but the vibrational analyses of some of these are uncertain, and only for the system C—X of Na_2 has a rotational analysis been attempted[7].

We have now examined the C—X systems of Li_2 and Na_2, using photographs taken in absorption in first and third orders respectively of a 6·5 m. grating spectrograph. Previous vibrational analyses are confirmed, but rotational analysis of some twenty bands of each system shows that the upper states of both systems are in fact both $^1\Pi$ and presumably, since the C—X systems appear to be quite strong, $^1\Pi_u$. The earlier rotational analysis[7], which led to the conclusion that $C(Na_2)$ was $^1\Sigma^+_u$, is incorrect.

At wave-lengths shorter than the C—X systems, there are many further bands, and rotational analyses of several of these have also been made. A long $v' = 0$ progression established the vibrational numbering in the D—X system of Na_2: this again proves to be $^1\Pi_u - {}^1\Sigma^+_g$. In Li_2, the D—X system is also $^1\Pi_u - {}^1\Sigma^+_g$, but it has not yet proved possible to determine an unambiguous vibrational numbering for this system. The present results are summarized in Table 1.

Table 1

	State	T_e	ω_e	$\omega_e x_e$	B_e	$10^3\ \alpha_e$
$^7Li_2$	$D\ ^1\Pi_u$	< 34,140	~ 205	—	0·465	—
	$C\ ^1\Pi_u$	30,549	237·9	2·23*	$0·5075_6$	$9·6_4$†
Na_2	$D\ ^1\Pi_u$	33,440	110	0·5	0·1185	1
	$C\ ^1\Pi_u$	29,393	117·3	$0·5_3$	$0·1231_3$	$0·8_4$

* + 0·060 $(v + \frac{1}{2})^3$
† + $0·00018_4\ (v + \frac{1}{2})^2$

The energies of dissociation of these states are of considerable interest, and in the case of the C states of Li_2 and Na_2, quite definite lower limits can be given. Considering first Li_2, the state $B\ ^1\Pi_u$ is known to correlate with Li(2s) + Li(2p), so that the lowest excited atom pair to give $C^1\Pi_u$ is Li(2p) + Li(2p), with $E_A = 29,808$ cm.$^{-1}$. Taking[8] $D_e''(Li_2) = 9,185$ cm.$^{-1}$, $D_e'(C) \ngtr 8,445$ cm.$^{-1}$. By analogy, however, with the absorption spectrum of H_2, it might be expected that the strong absorption systems of Li_2 would be $(2s\sigma_g np\pi_u)\ ^1\Pi - {}^1\Sigma^+_g$, so that it is perhaps more probable that state C correlates with Li(2s) + Li(3p), with $E_A = 30,925$ cm.$^{-1}$. If this is so, $D'_e(C) = 9,560$ cm.$^{-1}$. In either case, the energy of dissociation in state C is not very different from that in the ground state.

For $C\ ^1\Pi$ in Na_2, the lowest possible atomic states are Na(3s) + Na(3d), with $E_A = 29,173$ cm.$^{-1}$. Thence, with[8] $D_e''(Na_2) = 6,215$ cm.$^{-1}$, $D'(C) \ngtr 5,995$ cm.$^{-1}$. However, it seems more probable that what is observed here is $4\ p\pi_u - 3s\sigma_g$ rather than the partly forbidden transaction $3d\pi_u - 3s\sigma_g$. In the former case, $E_A = 30,270$ cm.$^{-1}$, and $D'(C) = 7,090$ cm.$^{-1}$.

It is more difficult to reach a definite conclusion about the $D\ ^1\Pi_u$ state of Na_2. Bands may readily be followed up to $v' = 13$ at about 34,840 cm.$^{-1}$ above the minimum in the ground-state but this is not high enough to rule out the possibility that $C^1\Pi_u$ is $(3s\sigma_g + 3d\pi_u)$ and that D is $(3s\sigma_g + 4p\pi_u)$. If, however, it is accepted that the correlation for state C is $(3s\sigma_g + 4p\pi_u)$, then state D may be correlated with $(3s\sigma_g + 5p\pi_u)$, to give $D\,(D) = 7,815$ cm.$^{-1}$. In this case, states B, C, D form a Rydberg series of states $(3s\sigma_g np\pi_u)^1\Pi_u$, and we may obtain an approximate value for the ionization potential of Na_2 as follows:

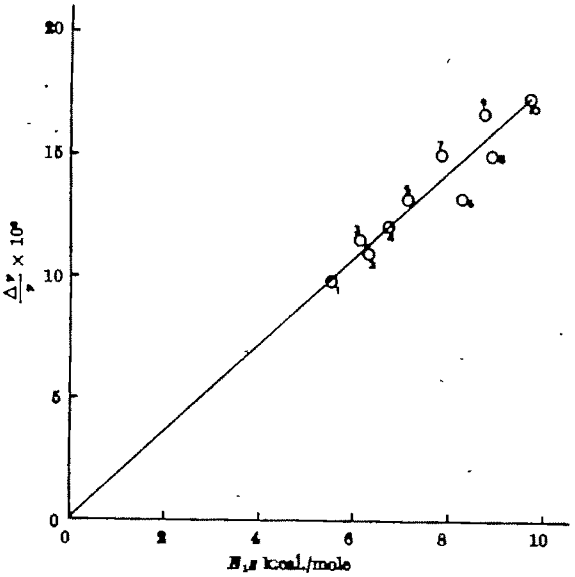

Fig. 1. Variation of frequency shift of acetone carbonyl group in different solvents with solute-solution interaction-energy. The solvents are: 1, ether; 2, carbon tetrachloride; 3, carbon disulphide; 4, benzene; 5, acetone; 6, acetonitrile; 7, chloroform; 8, nitromethane; 9, ethanol; 10, methanol

Such a relationship has been shown to exist for a number of molecules (for example, Bellamy, ref. 6).

It is evident from consideration of the frequency shifts on liquefaction that the value of K is different even for the same group in different molecules; this is presumably connected with the way in which the interaction energy is distributed among the degrees of freedom as well as with differences between the force constants of the bonds.

If equation 2 is found to be generally valid, the much-discussed question of what proportion of the frequency shift is attributable to non-specific interactions can be considered in terms of the extent to which pure dispersion energy contributes to the latent heats and heat of mixing.

Two Highly Selective Solvents for Gas-Liquid Chromatography Analysis of C_2–C_6 Hydrocarbons

IN the course of a systematic investigation of polar stationary liquids for gas-liquid chromatography at a column temperature of 30° C., it was found that dimethyl sulphoxide (CH_3SOCH_3, b.p. 189° C.) and sulpholane (tetramethylene sulphone, $(CH_2)_4SO_2$, b.p. 284° C.) are very suitable for the analysis of complex C_2–C_6 hydrocarbon mixtures. Under the conditions used (see below), columns charged with firebrick impregnated with these solvents have the following properties:

(1) Compounds of closely similar boiling point but different molecular type show widely different retention volumes. Relative corrected retention volumes (*n*-paraffin = 1·00) for (hypothetical) compounds with b.p. 30° C. are given in Table 1. For comparison data on the solvents dimethylsulpholane and squalane have been included, and retention volumes for one type of chlorinated compound are given.

Table 1. RELATIVE CORRECTED RETENTION VOLUMES FOR COMPOUNDS WITH b.p. 30° C.

Homologous series of compounds	Solvent			
	Dimethyl-sulphoxide	Sulpholane	Dimethyl-sulpholane	Squalane
2,2-Di-me-alkanes	0·8	0·86	0·81	0·96
2-me-alkanes	0·9	0·95	0·89	1·00
n-Alkanes	(1·00)	(1·00)	(1·00)	(1·00)
1-Alkenes	2·0	2·1	1·7	1·00
trans-2-Alkenes	2·2	2·1	1·8	1·00
2-me-1-Alkenes	2·45	2·4	1·9	1·00
cis-2-Alkenes	2·5	2·5	1·9	1·00
Unbranched cycloalkenes	2·5	2·4	1·9	1·3
1,3-Alkadienes	6·5	5·9	3·7	1·00
1-Cl-alkanes	11·0	11·7	6·4	0·77
1-Alkynes	15·3	11·7	6·4	0·69

(2) The separation efficiency is high. In the range of relative corrected retention volumes (*n*-butane = 1·00) up to 10·0, the average height equivalent to a theoretical plate is 1·5 mm. for dimethyl sulphoxide and 1·7 mm. for sulpholane (sample size of gaseous component < 0·1 ml.).

As a result of these two properties, the following compounds having closely similar boiling points are completely separated: ethane–ethylene–nitrous oxide–carbon dioxide–acetylene, and *iso*butene–1-butene. The resolution of 2-methyl-pentane (b.p. 60·3° C.) and 2,3-dimethylbutane (b.p. 58·0° C.) is nearly complete and comparable to that achieved by *iso*quinoline[1].

(3) Owing to the low solubility of paraffins and olefins, the time of analysis is short. Complex mixtures of hydrocarbon gases up to and including *cis*-2-butene can be analysed in 25 min. A complete separation of the 13 paraffins from methane to *n*-hexane is effected in 35 min.

(4) The solvents do not react with unsaturated compounds. When acetylenic compounds with active hydrogen atoms are determined, however, glass or stainless steel tubing is required as they react with copper in the presence of dimethyl sulphoxide. For sulpholane, copper tubing can be used.

(5) The volatility of dimethyl sulphoxide is not negligible, which causes retentions to decrease gradually. From the vapour pressure at 30·0° C.[2] it is calculated (for conditions specified below) that about 1,000 l. of carrier gas are required to make the loss of weight exceed the still allowable value of 5 per cent. As the liquid phase is mainly stripped off in the first section of the column, a regular replacement of this section will dispose of this problem. The operating conditions were:

	Dimethyl sulphoxide	Sulpholane
Column length	14·4 m.	18·0 m.
Internal diameter	6 mm.	
Packing	C-22 firebrick, 50/80 mesh	
Weight ratio solvent/solid support	30 : 70	
Hydrogen flow-rate	5·0 l./hr.	4·0 l./hr.
Column temperature (air bath)	30·0° ± 0·1° C.	

The commercial solvents were distilled before use; the colourless products had the following properties:

	Dimethyl sulphoxide	Sulpholane
Boiling point	61° C. at 6 mm. mercury	168·4° C. at 31 mm. mercury
Melting point	18° C.	27° C.
$n_D^{30\cdot00}$	1·47475	1·48168
Density (gm./ml.) at 30·00° C.	1·09036	1·26120

Thanks are due to Dr. G. W. A. Rijnders for his interest in this investigation and to Messrs. J. D. Kommer, H. J. Bogaard and N. v.d. Hoed for their co-operation in the experimental work.

Gas-Solid Chromatographic Separation of Hydrocarbons of High Molecular Weight

THE deactivation of highly active polar sites on activated alumina with water to give a satisfactory column packing for the gas chromatographic separation of C_1–C_4 hydrocarbons at room temperature has been reported[1]. An extension of this work has shown that alumina can be similarly deactivated with inorganic bases and salts added in aqueous solution, the water being removed by subsequent heat treatment. At low degrees of deactivation, retention volumes for aromatic hydrocarbons can be varied relative to aliphatic hydrocarbons according to the extent of deactivation. However, the amount of sample required (~100 µgm.) to obtain a response from a flame-ionization detector suggests that considerable irreversible adsorption takes place. The most promising application appears to be at the highest degrees of deactivation (lowest activity-levels, when irreversible adsorption is much reduced) for the separation of high-molecular weight hydrocarbons.

Fig. 1 shows the separation of C_{15}–C_{23} *n*-paraffins using an alumina (initial surface area 180 m.²/gm.) preheated for 70 hr. at 750° C. to reduce surface area and to which was added 40 per cent by weight of sodium hydroxide.

Fig. 2 shows the separation of $C_{[illegible]}$–$C_{[illegible]}$ *n*-paraffins on the same column with the temperature ranging

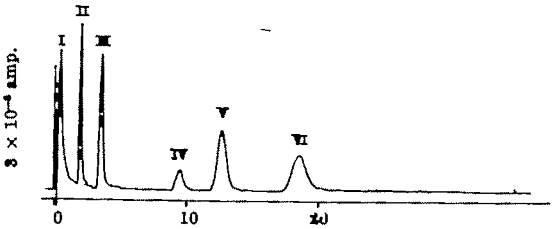

Fig. 1. Chromatographic separation of 50 μgm. total of steroid sample, as 5 per cent solution in benzene. Column temperature, 270° ; argon pressure, 25 p.s.i. ; column size, 100 cm. × 2 mm. ; argon ionization detection system. Compounds are I, solvent and androstane ; II, androstan-17-one ; III, cholesterol methyl ether and cholestanol methyl ether ; IV, cholestanone ; V, androstan-3,17-dione ; VI, Δ⁴-androstene-3,17-dione

An alternative to the use of non-polar phases lies in exploring the separating properties and retention times for thermostable polar phases. We have worked with an ethylene glycol–*iso*phthalic acid polyester (E. I. du Pont de Nemours, Inc.). The column packing was prepared by a solution technique[1] with a 10 per cent chloroform solution of the polyester and 60–80 mesh acid-washed 'Celite 545'. The coated 'Celite', containing 20 per cent (w/w) of stationary phase, was vibration-packed in a glass U-column (100 cm. × 2 mm.) and was conditioned briefly at 200°. A Lovelock argon ionization detector was used.

The separation of a synthetic mixture of steroids is shown in Fig. 1. Analyses within a temperature-range of 220–280°, with argon flow-rates of 50–100 ml./min., showed column efficiencies of 1,400–1,800 theoretical plates. No separation was observed for cholesterol methyl ether and cholestanol methyl ether in any circumstances, but androstane-3,17-dione and Δ⁴-androstene-3,17-dione had widely different retention times. There was no evidence of decomposition of any of these compounds ; but this point must be studied in greater detail and particularly with respect to derivatives of hydroxyl-substituted compounds. The thermal stability of the column was relatively good ; there was almost no 'bleed' at 200–220°, and thermal breakdown required several days at 280°.

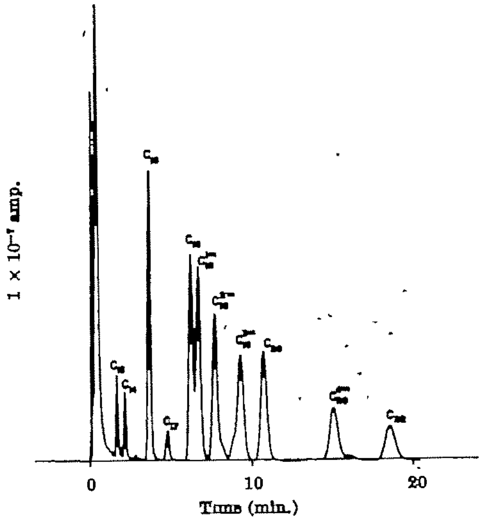

Fig. 2. Chromatographic separation of mixture of methyl esters of long-chain fatty acids. Column temperature, 230° ; argon pressure, 14 p.s.i. ; column size, 180 cm. × 4 mm. ; argon ionization detection system

Present knowledge of the properties of polyester phases is largely based on their use in lipid work for the separation of fatty acid methyl esters; this use is based on the observations of Lipsky and Landowne[3], Orr and Callen[4] and Craig and Murty[5]. Fig. 2 shows an array of fatty acid esters separated on an ethylene glycol–*iso*phthalate polyester column. The column may be useful for examinations of mixtures of very long chain compounds since the C–24 level may be reached in a few minutes if desired, but it is not likely to be useful in quantitative work because of the failure to separate completely methyl stearate and methyl oleate (oleate/stearate separation factor = 1·07).

For steroid separations, as with fatty acid esters, it is likely that both non-polar and polar phases will find specific applications. The present investigation provides an example of a polar phase suitable for steroid work.

[1] This effect is reflected in the data of Eglinton, G., Hamilton, R. J., Hodges, R., and Raphael, R. A., *Chem. and Indust.*, 955 (1959); the retention time for cholestanone in a 46-in. column at 220° with an 'Apiezon' *L*-phase was just under 4 hr. Other laboratories have observed shorter retention times under different circumstances (Lipsky, S. R., private communication).

Analysis of Solubility Data to estimate Small Amounts of Chain Fracture during the Cross-linking of Rubber

IN a communication[1] on methods of estimating chain fracture during the cross-linking of rubber by high-energy radiation, we mentioned that a quantitative analysis of solubility data was not attempted because results did not conform with a theoretical relationship derived by Charlesby and Pinner[2]. This relates the sol fraction (S) after dose R with the fracture and cross-link densities (p and q, respectively) and includes as a parameter the number average degree of polymerization before irradiation (u). This relationship (1) applies only for a polymer with a random molecular weight distribution and for the case where fracture and cross-linking are random and proportional to the dose. Hayden[3] has recently reported results which apparently do conform with this relationship. These are now contrasted with our previous results in order to emphasize some limitations concerning the general utility of this method for estimating small ratios of fractures to cross-links.

$$S + S^{\frac{1}{2}} = pq^{-1} + (quR)^{-1} \qquad (1)$$

Most of our samples of rubber were taken from the same source as Hayden's and apparently only differed in having been initially masticated to lower molecular weight; they were also irradiated under similar conditions. The linear plot reported by Hayden and represented in Fig. 1 was defined by results obtained after doses of up to about 15 M.rads.

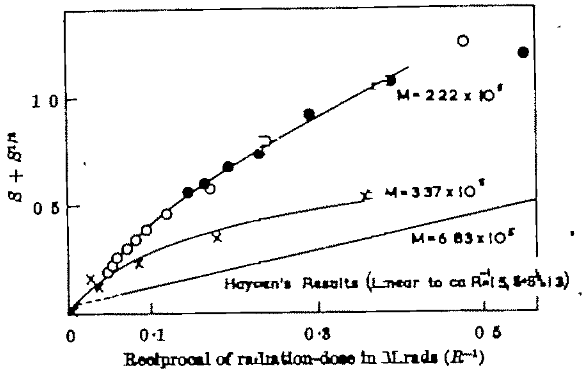

Fig. 1. Curves of $S + S^{1/2}$ against reciprocal dose for various rubbers irradiated with 4-MeV. electrons. Dose-rate of order 10^4 rads/min. M values represent initial number average molecular weight

It can be seen that in addition we obtained results at higher doses which do not lie on a straight line, but instead curve towards the horizontal axis. In these circumstances the significance of Hayden's linear extrapolation from his results to the $S + S^{\frac{1}{2}}$ axis and his estimation of the ratio of fracture to cross-links, pq^{-1}, as 0·05 is open to doubt.

The discrepancy between our results and simple theory is not surprising because it seems certain that such samples of rubber do not have a random molecular weight distribution[4]. This is, of course, generally the case for most samples of polymer, and it is significant that similar analysis of solubility data has usually been applied to estimate relatively high values of pq^{-1} of about 0·3. In such cases a random distribution might well be formed through random fracture during irradiation, and relationship (1) would then be applicable to solubility measurements made after sufficiently high doses. The average number of fractures per initial molecule may be calculated from the expression $6 \cdot 25 \times 10^{17}\, RG(F)MN^{-1}$, where $G(F)$ is the number of fractures for a dose of 100 eV., equal to 0·04 in Hayden's experiments, N the Avogadro number, and R and M are as defined previously. Then in the dose-range of from about 0·8 to 15 M.rads, in which he found a linear relationship between $S + S^{\frac{1}{2}}$ and R^{-1}, the corresponding average number of fractures per molecule would only be 0·02–0·43. This small amount of fracture would have relatively little effect on the molecular weight distribution[5] and therefore Hayden's rubber, unlike ours, either approximated to a random distribution before irradiation or his interpretation of the intercept obtained by linear extrapolation is unjustified. Current measurements indicate that the first of these alternatives is unlikely. For example, a rubber of number average molecular weight 5×10^5 had a ratio of weight to number average molecular weights closer to 1 rather than to the value of 2 characteristic of a random distribution (Allen, P. W., and Bristow, G. M., unpublished work).

In summary, we emphasize that in order to estimate small values of pq^{-1} from solubility measurements it is important to obtain data after sufficiently high doses and also to consider whether the assumption of a random molecular weight distribution is justified in order that relationship (1) may properly be applied.

or a shoulder appeared at about 320 mμ, indicating a ketonic group. Thus, the ring in these cases should be opened by neutralization. Now, the compound (5) has shown the same behaviour.

Regarding the cyclic formula one could expect compounds with this structure to have acidic properties, and therefore it seemed worth while to compare these two categories by means of titrations and *p*H determinations. Fig. 1 gives in short the results; curve (*a*) refers to the cases (1), (3) and (5), that is, the cyclic *cis* structure, and curve (*b*) to the cases (2) and (4), that is, the (open) *trans* structure. Evidently, this seems to be a complementary method for determining the structure, and it follows that the pK_a values about 5·5 and 3·5 respectively characterize the curves. Back-titration gives the same curves. As from the ultra-violet spectra it must be concluded that the ring opens upon neutralization, it evidently is—if not instantaneously but very rapidly—closed upon acidification. Thus, it seems evident that the maximum at 245 mμ refers to the open *cis* form, which has been proposed previously.

A further report, also including nuclear magnetic spectra for these compounds, will be given elsewhere with a more detailed discussion.

BIOCHEMISTRY

Occurrence of Keto-Acids in Blood Serum and Urine of Cattle in Comparison with Man, Horse, Sheep and Dog

In connexion with metabolic disorders occurring in cows, such as parturient paresis and acetonaemia, an investigation concerning the keto-acids occurring in blood serum and urine was started. Several authors have carried out work in this field concerning man. Keto-acids are converted into 2,4-dinitrophenylhydrazones, after which they are separated by means of paper chromatography. The 2,4-dinitrophenyl hydrazones are reduced by hydrogen to amino-acids and identified as such. In this way Cavallini *et al.*[1], El Hawary and Thompson[2], Markees[3], Biserte and Dassonville[4] and De Schepper *et al.*[5] showed that the following α-keto-acids occur in human blood : α-ketoglutaric acid, pyruvic acid, α-keto*iso*caproic acid, α-keto*iso*valeric acid and α-keto-β-methylvaleric acid. Moreover, it was shown that pyruvic acid predominates in human blood and α-ketoglutaric acid in human urine[4].

Applying De Schepper's method[5] the keto-acids of bovine serum were converted into 2,4-dinitrophenyl hydrazones and separated by means of chromatography, as well as by electrophoresis combined with evaporation at 6 V./cm. at *p*H 11·7. After reduction with hydrogen and platinum oxide as a catalyst, the amino-acids obtained were examined both by electro-

phoresis at pH 4·7 and by two-dimensional chromatography in different solvents. The following amino-acids were formed: aspartic acid (in small quantities), glutamic acid, alanine (much), valine and *iso*-leucine, γ-aminobutyric acid and glycine. From this it follows that besides the keto-acids mentioned before, succinic semialdehyde and glyoxylic acid occur in bovine blood as well.

As succinic semialdehyde, so far as we know, has not hitherto been found to occur in human blood, and glyoxylic acid only occasionally[4], identical experiments were made with human serum. It appears that it contains succinic semialdehyde as well as glyoxylic acid. Bovine urine, after preliminary purification, was investigated in the same way. The most striking result was the high content of glyoxylic acid. Moreover, bovine urine contains oxaloacetic acid and succinic semialdehyde. As the observations made by Biserte[4] on human urine were different, the latter was examined in the same manner. It appeared that now α-ketoglutaric acid showed the highest value, followed by pyruvic acid and finally succinic semialdehyde, oxaloacetic acid and glyoxylic acid. These results are in accordance with Biserte's findings.

As there was this remarkable difference between the contents of glyoxylic acid in human and bovine urine, the serum and urine of a few other animals, namely, sheep, horse and dog, were examined. The results are shown in Table 1. The intensity of the spots, coloured by interaction with ninhydrin, of the amino-acids produced by reduction is indicated by the number of + signs.

From Table 1 it appears that the serum contents of keto-acids in man and in the various animals show only slight differences; the urine, however, varies considerably.

This investigation has shown that: (*a*) Human serum and urine contain succinic semialdehyde in addition to the α-keto-acids already found. Glyoxylic acid occurs in small quantities in human serum as well as in urine. (*b*) Serum of cow, sheep, horse and dog contains the same keto-acids as human serum, and in almost the same quantities. (*c*) Bovine and sheep urine contains, compared with human urine, a far greater quantity of glyoxylic acid, whereas the latter contains more α-ketoglutaric acid.

Details of the methods used will be published in full with the results of an investigation on the keto-acids in the rumen of cattle. I am greatly indebted to Miss W. Klazinga and Mr. H. Vreman and Mr. C. G. van der Kamp for experimental assistance and Mr. W. D. Brands for making the necessary equipment.

Formation of a New Metabolite of Epinephrine and Norepinephrine in Liver and Kidney

IN previous work it was found that after the injection of norepinephrine and epinephrine in rats, a new metabolite of these compounds was excreted in the urine[1]. Axelrod *et al.*[2] have isolated recently from the urine of rats a metabolite of epinephrine and norepinephrine, which they have identified as 3-methoxy-4-hydroxy phenyl glycol. We have found that after the intravenous infusion in cats of a mixture containing both norepinephrine-7-^{3}H and epinephrine-1-^{14}C, a similar compound was found in the liver and kidney of this animal.

In these experiments, 10 ml. of 4·5 × 10^{-4} M solution of norepinephrine-7-^{3}H and epinephrine-1-^{14}C with a ^{3}H : ^{14}C activity ratio of 5 : 1 were infused during a period of 30 min. into the femoral veins of untreated cats and cats pretreated with iproniazid phosphate. At the end of the infusion period the animals were killed and the organs were removed and quickly frozen. The tissues were homogenized in saline and then deproteinized by the addition of 0·4 N perchloric acid according to the procedure of Ake Bertler *et al.*[3]. The water layer at pH 2 was extracted four times with ethyl acetate. This ethyl acetate fraction was then chromatographed in chloroform–acetic acid–water (2 : 1 : 1) overnight. The run-off was then chromatographed in *iso*propyl alcohol–aqueous ammonia–water (8 : 1 : 1) over a period of 12 hr. In this procedure 3,4-dihydroxymandelic acid remained on the paper in the chloroform–acetic acid–water system and the run-off contained 3-methoxy-4-hydroxymandelic acid.

Levels of Pyridine Nucleotides in Liver Poisoning

Gallagher and Simmonds[1] have shown that rats are protected against the lethal effects of carbon tetrachloride by prophylactic treatment with precursors of pyridine nucleotides. Such treatment was found also to protect against the loss of pyridine nucleotides from liver cells and to prevent necrosis of liver cells after dosing with carbon tetrachloride[2,3]. Rees, Spector and Sinha[4] found that the administration of 'Phenergan' (10-(2-dimethylamino-*iso*propyl) phenothiazine hydrochloride) to animals poisoned with carbon tetrachloride protects the liver cells against necrosis. In the present investigation we examined the effect of treatment with 'Phenergan' on the pyridine nucleotides of liver cells in carbon tetrachloride poisoning. The work was also extended to other liver poisons such as thioacetamide and dimethyl nitrosamine.

Table 1. EFFECT OF 'PHENERGAN' ON THE LEVELS OF PYRIDINE NUCLEOTIDES IN THE LIVER IN RATS POISONED WITH CARBON TETRACHLORIDE

Treatment	E_{340} absorption
Nil	1·26
'Phenergan'	1·40
Carbon tetrachloride	0·65
Carbon tetrachloride + 'Phenergan'	1·13

Rats were killed 24 hr. after poisoning with carbon tetrachloride (1·25 ml./kgm. body-weight). 'Phenergan' dosing was at 0 and 6 hr. following poisoning (25 mgm. and 12·5 mgm./kgm. body-weight respectively). The E_{340} reading is corrected to 10 mgm. fat-free dry weight of liver extracted with 5 ml. 5 per cent w/v trichloracetic acid solution.

Table 1 shows that the administration of 'Phenergan' to rats poisoned with carbon tetrachloride prevented largely the fall in the level of pyridine nucleotide which followed the action of carbon tetrachloride alone. As was shown by Rees and Sinha (ref. 5, and unpublished work) the hepatotoxic agents carbon tetrachloride, dimethyl nitrosamine and thioacetamide lead to a different chronological pattern of leakage of liver enzymes into the blood stream. Consequently we determined the level of pyridine nucleotides in the liver and the serum at different times during the course of poisoning to determine the time relationships of the change.

Table 2 shows that as early as 5½ hr. after the administration of carbon tetrachloride there is a considerable fall in the E_{340} of the acid extracts of liver homogenates, but at this time there is no fall in the mitochondrial E_{340}. However, 10½ hr. after administration of carbon tetrachloride the mito-

	9	—	—	0·62
	10·5	1·17	0·50	—
	20	1·18	0·59	—
Dimethyl nitrosamine	5·5	1·16	0·54	—
	9	—	—	0·66
	10·5	0·86	0·39	—
	20	0·68	0·40	—

Rats were dosed with carbon tetrachloride, 1·25 ml./kgm. body-weight; thioacetamide, 200 mgm./kgm. body-weight, and dimethyl nitrosamine, 100 mgm./kgm. body-weight. The E_{340} reading is corrected to 10 mgm./fat-free liver-weight for the liver homogenate, to 1 mgm. nitrogen for the mitochondria and to 1 ml. of serum. In all cases extraction of the tissues was made with 5 ml. 5 per cent w/v trichloracetic acid solution.

chondrial-levels had also fallen. This is in good agreement with the data on the leakage of enzymes from the liver in carbon tetrachloride poisoning. Rees and Sinha[4] have shown that at 6 hr. there is loss from the liver of cytoplasmic isocitric dehydrogenase and malic dehydrogenase and that the loss of mitochondrial enzymes occurs later, at about 12 hr. Consequently it appears that the initial effect of carbon tetrachloride is on the cell membrane, leading to a leakage of cytoplasmic constituents, and that mitochondrial damage occurs later in the course of the poisoning. In the case of thioacetamide poisoning, no fall in the E_{340} of either liver homogenates or mitochondria is observed during the 20-hr. course of the poisoning (Table 2). This is in contrast to the enzyme leakage from the liver cells and mitochondria, and suggests that the effect of carbon tetrachloride and thioacetamide on semi-permeable membranes may be different. Finally, dimethyl nitrosamine does not affect the E_{340} of either the liver homogenate or mitochondria at 5½ hr., but the E_{340} of both is depressed by 10½ hr. (Table 2). This finding agrees with the observed time relationships of the leakage of cytoplasmic constituents (Rees and Sinha, unpublished work) but indicates that pyridine nucleotides are lost from the mitochondria at a time when glutamic dehydrogenase is not leaking. This again suggests a type of damage to the semi-permeable membrane different from that occurring with the other two poisons.

Measurement of the serum E_{340} values at 9 hr. (Table 2) after poisoning with each of the above agents showed that there is a rise in the E_{340} following carbon tetrachloride poisoning, no change in the case of thioacetamide and a smaller rise in the case of dimethyl nitrosamine. These results are in good agreement with the levels of pyridine nucleotides in the livers of animals poisoned with each agent.

This work has shown that treatment with 'Phenergan', like pretreatment with precursors of pyridine nucleotides, maintains normal levels of pyridine nucleotides following carbon tetrachloride poisoning. However, it is probable that whereas the pyridine nucleotide precursors maintain this level by stimulating replacement of the nucleotides lost as a result of carbon tetrachloride poisoning, 'Phenergan' appears to act by preventing the leakage of pyridine nucleotides and of enzymes across the mitochondrial and cell membranes.

This investigation also shows that the loss of pyridine nucleotides from liver cells subsequent to carbon tetrachloride poisoning is an early event in the course of the poisoning and is not simply a result of necrosis of liver cells. The results with dimethyl nitrosamine and thioacetamide indicate that the three hepatotoxins have different effects on the semi-permeable membranes. In the case of carbon tetrachloride there is a loss of cytoplasmic and mitochondrial enzymes as well as cytoplasmic and mitochondrial pyridine nucleotides. Dimethyl nitrosamine leads to a loss of cytoplasmic enzymes but not of mitochondrial enzymes, and to a loss of pyridine nucleotides from both. Finally, thioacetamide, although leading to a loss of both cytoplasmic and mitochondrial enzymes, does not lead to the loss of cytoplasmic or mitochondrial pyridine nucleotides. Thus it appears that at least two types of membrane damage can occur, one leading to a loss of enzymes only (for example, thioacetamide), and the other to the loss of pyridine nucleotides only from the mitochondria, as in dimethyl nitrosamine, while a combination of these effects or a more general third group leads to the loss of both as in carbon tetrachloride poisoning.

Isolation of a δ-Lactone Compound from the Leaves of *Clitoria marina* Linn.

THE plant *Clitoria marina* Linn. belongs to the Papilionaceae sub-group of Leguminosae, and is distinguished from *Clitoria ternatea* Linn. by its light-blue to almost white flowers. The leaves of the plant are used in medicine in India. A systematic chemical examination of the leaves has therefore been undertaken, and isolation of a δ-lactone compound from the alcoholic extract of the leaves has been achieved.

Sun-dried and powdered leaves were exhaustively extracted with 80 per cent ethyl alcohol in a Soxhlet for 36 hr. The extract was filtered hot, the filtrate reduced to half its original volume under reduced pressure and kept at 0° for 10 hr. when a solid substance settled down. The solid was separated, boiled with a large excess of ethyl alcohol, filtered and the filtrate again kept at 0° for 3 hr. The separated solid was refluxed with ethyl alcohol and a little activated animal charcoal and filtered hot. The filtrate on cooling deposited a white amorphous substance, m.p. 92° (yield 0·1375 per cent on dry weight basis). Further purification did not alter the melting point, and the purity of the product was established by chromatographic examination.

The substance was insoluble in water, cold ethyl alcohol, chloroform, petroleum ether and ether; but sparingly soluble in hot ethyl alcohol, benzene, pyridine and ethyl acetate. It did not decolorize bromine water or alkaline potassium permanganate and gave no acetyl derivative. It also did not reduce Fehling's solution and did not give tests for the presence of a keto group. It was found to be lævo-rotatory. Found: C, 78·95; H, 12·82 per cent, mol. wt. (Rast) 386; $C_{26}H_{50}O_2$ requires C, 79·18: H, 12·69 per cent, mol. wt. 394.

The bromo-derivative of the substance prepared by the usual bromination procedure was obtained as a pale yellow powder m.p. 80°. It was soluble in benzene, chloroform and ether. Found: Br, 16·65 per cent. $C_{26}H_{49}O_2Br$ requires Br, 16·84 per cent. On treatment with freshly distilled hydrogen iodide (b.p. 126°), an ash-coloured product, m.p. 68°, was obtained. Found: I, 24·00 per cent. $C_{26}H_{51}O_2I$ requires I, 24·33 per cent.

The methyl ester of the substance prepared by usual esterification procedure gave a white amorphous powder, m.p. 74°, soluble in ether and chloroform.

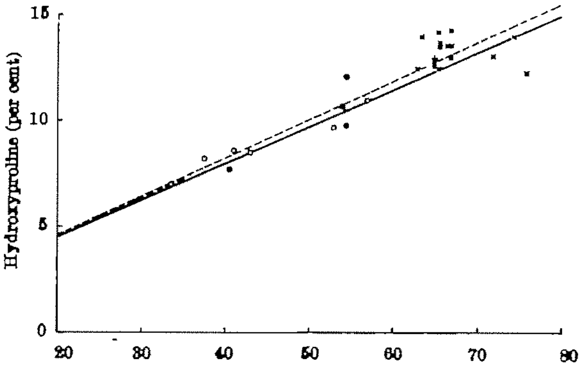

Fig. 1. ○, Fish skin collagen; ×, human dermal collagen; +, rat tail tendon; ●, cattle hide

include the additional values, hydroxyproline = 12·0 per cent and 13·0 per cent for cattle hide and rat tail tendon respectively. The continuous straight line in Fig. 1 has been fitted by the method of least squares to these data on the assumption that the relation between hydroxyproline and T_s is linear.

Also included in the graph are the data of Hall and Reed[2], who determined the T_s versus hydroxyproline content of human dermal collagen. Hall and Reed concluded from their experiments that there was no correlation between hydroxyproline and T_s. However, as can be seen from Fig. 1 their data fall in their appropriate position with respect to the line drawn to the circle data, and it is clear why no correlation could be seen from their data alone—the range of hydroxyproline was too narrow. It is interesting and significant to find collagen from such widely differing sources following such a simple relation, which supports Takahashi's[1] and Gustavson's[3] original contention.

If the data of Takahashi and Hall and Reed are together fitted by a least-square method the dotted line in Fig. 1 is obtained. Its close proximity to the first line again shows the close correlation in behaviour of different collagens.

If the dotted line in Fig. 1 is accepted as valid then it is possible to make some speculations about the biological implications of a below-normal hydroxyproline content in human collagenous structures. For example, it has been reported by Bowes, Elliott and Moss[4] and others[4] that the hydroxyproline content of fibrinoid tissue from rheumatic fever patients and in rheumatoid arthritis was lower than in normal tissue. They quoted a value of 8·3 per cent for fibrinoid tissue which, according to Fig. 1, would give the collagen a T_s value of 40° C. As 40° C. is close to normal blood temperature and could be reached during a fever it is suggested that these rheumatic effects are the result of a structural breakdown due simply to temperature. It is not necessary that the actual T_s values be reached for, as Weir[5] has shown, shrinkage is a rate process, and given sufficient time shrinkage will occur at temperatures about 5° C. below the instantaneous shrinkage temperature (our T_s). Furthermore, if the structure happens to be under tension, then the denaturation process is likely to be accelerated (although the T_s will be increased owing to the fact that extra tension has now to be generated in order to overcome the applied tension before contraction can take place). This idea has been discussed extensively by us elsewhere[6] and applied to the phenomena of 'heart murmurs'. This stress mechanism could be a factor in explaining the predominance of rheumatic complaints in the joints.

Finally, it has been reported by Briscoe and Loring[7] that the hydroxyproline content of the collagen of human lung increases with age. If this increase applies to collagenous structure generally, then it would appear that the body has a built-in defence mechanism for resisting denaturation, and only the young would be vulnerable to immediate effects of body temperatures higher than normal. In support of this view there is evidence, for example, that the high temperatures associated with rheumatic fever are more damaging to young patients than to adults. On the other hand, since the process of denaturation is rate-controlled, the time factor becomes important in the manifestation of rheumatic symptoms when the effect of temperature higher than normal is not involved. Thus where the hydroxyproline content is close to normal but slightly below it, many years would elapse before denaturation was complete, and this is a possible explanation of the fact that rheumatism is predominantly a disease of the adult.

In other words, if for hereditary or other reasons the increase of hydroxyproline (presumably by conversion of proline to hydroxyproline) with age does not occur (or the increase is slower than normal) then the individual concerned is likely to become a rheumatic. The above views may explain why many symptoms are common to both rheumatoid arthritic and rheumatic fever patients, for example, cardiac lesions, swelling and pain in joints. In both cases collagen has been denatured.

In this communication we have only considered the denaturation of collagen as a function of temperature. It is realized that other denaturation mechanisms occur; these will be discussed in a later publication.

Effect of Electronarcosis on Oxygen Consumption and Carbon Dioxide Output

IN assessing changes of vital function during electronarcosis, we measured oxygen consumption and carbon dioxide output in an experiment in rabbits. The measured values were considered an important index for the evaluation of metabolic changes during electronarcosis.

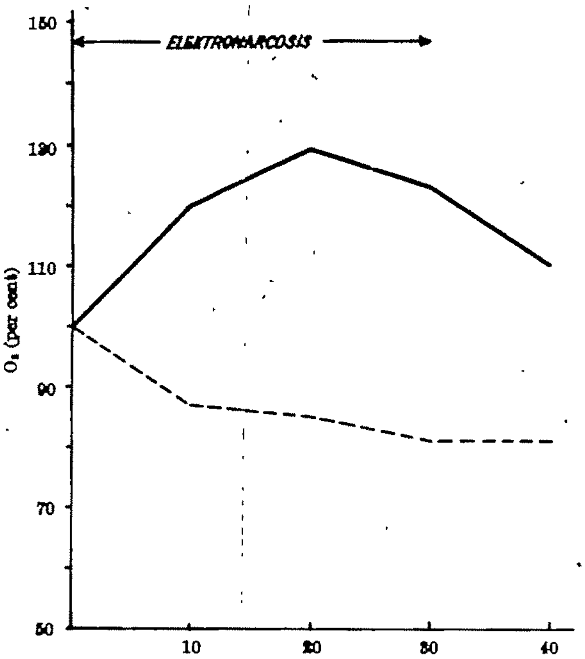

Fig. 1. Oxygen consumption during electronarcosis. ——, During electronarcosis; ...., control

In 10 rabbits the resting values of oxygen consumption and carbon dioxide output were measured. The average value from a 15-min. measurement was taken as 100 per cent. Having carried out these measurements we induced electronarcosis by combining the Leduc and direct current (tension 50 V., frequency 100 c./sec. admixture of the direct current 15 per cent, relation of impulse length to break 1 : 9, intensity 0·6 m.amp.). The current is applied through external bitemporal electrodes with felt covering soaked in sodium chloride solution. The values were followed for 15 min. before electronarcosis, for 30 min. of the electronarcosis duration and for 15 min. afterwards. The same animals served as controls for the same length of time but without electronarcosis.

(1) *Oxygen consumption.* A clear rise of oxygen consumption during electronarcosis was observed in all cases. The maximum is attained 20 min. after the beginning of electronarcosis and reaches about 150 per cent of the original value. In the following course of electronarcosis oxygen consumption decreases slightly, but after 30 min. it is still more than 120 per cent. When the electronarcosis is interrupted the oxygen consumption falls abruptly. Average values in time are shown in Fig. 1.

(2) *Carbon dioxide output.* The output increases during electronarcosis by a rise which is even sharper than that of oxygen consumption. A second rise of the output occurs after interrupting the electronarcosis. The time course is given in Fig. 2.

(3) The values of the respiration quotient can be elaborated from the preceding measurements. The curve in time follows roughly that of the preceding curve, but the rise after interrupting the narcosis is more marked.

The rise of oxygen consumption is striking, considering its fall in all types of drug narcosis. The explanation for this might be found in an increased muscle tone which can be proved especially at the

ectronarcosis. ——, During
. . ., control

The rise in carbon dioxide output is the result of an increased tissue metabolism evident already from the changes in oxygen consumption.

The course of values measured after interrupting the electronarcosis implies that no oxygen debt ensues during the electronarcosis. The changes of the respiration quotient leave room for an assumption that the tissue metabolism changes during electronarcosis are not only quantitative but qualitative as well.

Role of Mucoid Substances of the Aorta in the Deposition of Lipids

THE mechanism of deposition of lipids in the vessel-wall seen from the point of view of the pathogenesis of atherosclerosis represents the central problem of the latter. In agreement with numerous data[1-4], our previous investigations[5] proved that in the morphogenesis of both human and experimental atherosclerosis the deposition of lipid substances in the aorta is preceded by an increase of metachromatically stainable mucoid substance.

By means of immuno-electrophoresis it could be proved that one part of the lipids in the aortic intima is identical with plasma-β-lipoprotein[6].

Bernfeld's[7] investigations have proved the formation of specific complexes between polyanions of high molecular weight and β-lipoprotein. Based on this, we have supposed a kind of complex-formation between the substances of similar chemical character, accumulated in the aortic wall (mucoids) and the plasma-β-lipoprotein. Thus the formation of this specific complex might be considered as the beginning of the process of lipid deposition. Our supposition finds support in the histological findings that the deposition of lipids mainly occurs in those areas of the aorta which are rich in metachromatically stainable substances.

Based on these facts we have investigated whether the mucopolysaccharides of sclerotic human aortic intima dispose of the ability of binding β-lipoprotein specifically.

Employing the method of Dyrbye and Kirk[8] we have isolated the mucopolysaccharides of sclerotic human aortic intima. The isolated mucopolysaccharides may be separated by paper-electrophoresis into two fractions: one of them having a higher mobility, being periodic acid–Schiff-negative and containing a considerable amount of sulphate, and the other with a lower mobility, periodic acid–Schiff-positive, with mere traces of sulphate.

The mixture of mucopolysaccharides obtained in this way was electrophorized after having been mixed with pure human β-lipoprotein. We have stated that the β-lipoprotein moves together with the aortic mucopolysaccharide fraction of lower mobility (Fig. 1).

After having mixed the aortic mucopolysaccharides with native (normal) human plasma and electro-

Fig. 1. Interaction of pure human β-lipoprotein with aortic mucopolysaccharides. Veronal buffer, pH 8 6, 16 hr., 200 V., 10 m.amp.

phorized the mixture we have found that the β-lipoprotein fraction of the plasma also in this case moved together with the mucopolysaccharide fraction of lower mobility. In this case, however, the interaction causes a retention because of the higher mobility of the native β-lipoprotein (Fig. 2). The mobility of plasma-α-lipoproteins does not show any change. This circumstance proves that mucopolysaccharides of the aortic intima did not bind the plasma-α-lipoproteins. It is in conformity with the fact that plasma-α-lipoprotein cannot be shown to be present in the sclerotic aortic intima with the method of immuno-electrophoresis.

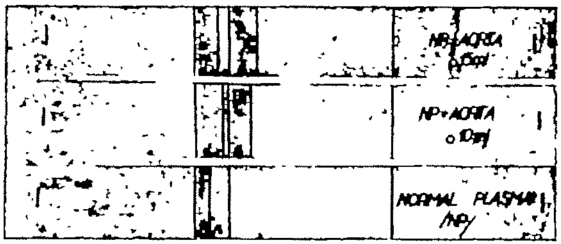

Fig. 2. Interaction of normal human plasma-lipoproteins with aortic mucopolysaccharides. Stained with sudan black. 400 V., 30 m.amp., 2 hr. Borate buffer, pH 8 6

The present investigations support our supposition that the basis of deposition of plasma-β-lipoproteins in the sclerotic aortic intima may be found in the ability of binding plasma-β-lipoprotein of some specific mucopolysaccharides of the aortic intima.

Details and discussions of these problems will be published elsewhere.

Effect of Lysergic Acid Diethylamide on Larval Growth

Lysergic acid diethylamide is known to be hallucinogenic in man[1] and to produce behavioural aberrations in experimental animals. When administered to spiders[2], lysergic acid diethylamide improved the regularity and angles in the pattern of the web. In the liver fluke (*Fasciola hepatica*) lysergic acid diethylamide intensified the motility[3]. However, in most cases the effects of lysergic acid diethylamide decrease shortly after withdrawal of the drug. In humans the effects may persist as long as 24 hr. in many cases[4]. Increased resistance to lysergic acid diethylamide on repeated administration has been reported[5]. Our present investigation shows that incorporation of lysergic acid diethylamide with the food caused marked reduction in growth of larvæ of *Tenebrio molitor*, which was not reversed by returning the larvæ to normal diet.

Adult larvæ of the same age and weight were carefully selected from a stock and divided into two groups of thirteen each. Group I received the basal diet consisting of 77 per cent corn meal, 15·4 per cent bran, 7·6 per cent wheat germ supplemented with 1 per cent of yeast extract. Group II received the same diet except that 2·5 mgm. of lysergic acid diethylamide were added per 10 gm. of diet. The larvæ were returned to fresh diet every week. The growth-rates of these two groups are presented in Table 1, which shows the inhibitory effect of lysergic acid diethylamide on the growth of the larvæ.

Experiments have been carried out to test the duration of the effect of lysergic acid diethylamide. Small larvæ were selected and placed on the lysergic acid diethylamide diet for the first four weeks and then returned to the control diet. The results are presented in Table 2. The toxic effect of lysergic acid diethylamide on the growth of the larvæ persists long after the withdrawal of the drug. This long-standing effect of lysergic acid diethylamide is different from that of a vitamin deficiency where fast growth-rate

A comparison now between the electrophoretic diagrams of all the cases with normal urinary titres (Fig. 1) with those with more or less increased œstrogen excretion (Fig. 2) brings out a difference. The two protein fractions nearest to the starting point are in the former cases comparatively less prominent, while in the latter they have a dominant character found in many cases of chronic prostato-vesiculitis[6].

By way of introduction, the point was made that the prostate gland in its capacity as a secondary sex organ in relation to both its development and secretory activity is ultimately dependent on testicular hormone.

Evidently, in many cases of chronic prostato-vesiculitis there occur high œstrogen urinary excretions. Since in certain of these cases the gonadotrophin titres are similarly increased, this might express an inhibition of testosterone production.

This circumstance might be interpreted as primary, making the gland susceptible to infection. Or, on the other hand, it might be a consequence of a primary prostatic infection. Finally, as a new point of view, a reduced testosterone activity might influence the target gland to develop an inflammatory reaction, clinically interpreted as a state of infection.

Eosinophil Leucocyte-attracting Effect of Histamine in Skin

WHEN histamine is injected into skin, one of the ffects that follows is an attraction of eosinophil eucocytes. A number of reports of this have been ublished[1-4]; but none of these papers discussed the ffects of widely differing rates of dosage, nor the arying degrees of eosinophilic infiltration around the njection site. The purpose of this communication is o report upon the extent of the eosinophil infiltration vhich follows various doses of histamine as the acid hosphate into the skin of horses.

The skin of the necks of cross-bred ponies was ised. The sites for injection and subsequent biopsy vere so placed that the centres of the sites were at east 10 cm. apart. The intradermal injections onsisted of the required amounts of histamine acid hosphate (B.D.H.) dissolved in 0·2 ml. sterile hysiological saline. The development of oedema vas measured and recorded, and the skin biopsies vere made 4 hr. after injection. The method has een described in detail elsewhere[5].

Six ponies were prepared each with 11 test sites for iopsy on both sides of the neck, a total of 132 sites. njections of histamine were given so that doses of ·01 μgm. to 20 mgm. were dispersed at random among he available sites on each pony, while two control sites n each pony received the saline vehicle only. From he skin biopsies, sections were prepared, and counts of the eosinophils occurring in 25 consecutive high-power fields were made. The results are expressed as an average number of eosinophils in each field (Fig. 1). Each observation is plotted with the standard deviation.

In the conditions of this experiment, a maximal eosinophilic infiltration occurred with doses approximating to 100 μgm. A second high response occurred with doses of 5 mgm. Some infiltration with eosinophils occurred with a dose as low as 0·05 μgm., while the control sites which did not receive any histamine had an average eosinophil count less than 0·1 cell per high-power field.

In another experiment a circle of 20 cm. diameter was prepared and shaved on the lateral aspect of the neck of a cross-bred pony. An intradermal injection of 5 mgm. of histamine acid phosphate was made in the centre of the circle and the precise injection site marked. After 4 hr., the oedema was carefully recorded on a scale drawing and skin biopsies were taken along 4 radii of the circle at 1-cm. intervals. The eosinophilic infiltration of each was assayed and the results are shown in Fig. 2. It was found that two areas of oedema could be recognized: a primary zone around the site of injection and a secondary zone ventral to this, presumably due to the spread of the histamine by gravity to areas below the primary site.

Replicates of this experiment using 15 mgm. of histamine acid phosphate gave an essentially similar result except that both the oedema and the eosinophilia extended over a slightly larger area. A dose of 100 μgm. gave a similar picture so far as the inner 5-cm. radius of the circle was concerned, but there was no secondary oedema.

In the skin of horses, intradermal injections of histamine produce a degree of eosinophilic infiltration which is related to the dose of histamine. From about 0·5 μgm. to 50 μgm. the increase is linear. It is of interest that doses greater than 200 μgm. produce less eosinophilic infiltration than do smaller doses, but presumably no local concentration of histamine approaching these levels could occur in life. The secondary oedema which follows intradermal injection

in vitro action of drugs. The effect of 6-mercaptopurine on sensitive cells was studied in three experiments. Two vessels containing cells alone and two containing cells and 6-mercaptopurine (10 *M* twice and 6 *M* once) were set up each time. Between 7 and 15 million cells in 5 ml. of a mixture of medium 199 (80 per cent) and normal human serum (20 per cent) were used and the drug added between 30 and 45 min. before the first readings. Fig. 1 summarizes the results. The thick lines represent the averages of the six readings and the shaded area the ranges. 6-Mercaptopurine caused a decrease in the net gas production; this effect noticeable at 3 hr. is clearly significant by 5 hr.

When a 6-mercaptopurine-resistant strain of *L*1210 cells became available through the courtesy of Dr. L. W. Law, of the U.S. National Cancer Institute, the experiments were repeated. Under the same experimental conditions the *in vitro* gas production of

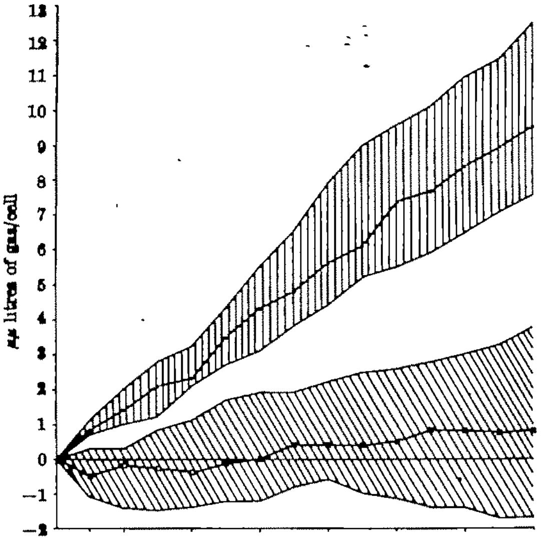

Fig. 2. A comparison of the net gas production of sensitive and 6-mercaptopurine-resistant *L*1210 cells
● and vertical shading, sensitive cells: no drug control; □ and oblique shading, sensitive cells: 6-mercaptopurine

the resistant cells was found to differ considerably from that of the sensitive cells.

This difference is illustrated in Fig. 2. The net gas production of the resistant cells was recorded on three separate occasions utilizing 2, 2 and 4 vessels, respectively. The average finding of the eight recordings is given in the thick line and the range by the shaded areas. On one occasion sensitive cells tested at the same time gave results which fell into the range illustrated in Fig. 1.

The effect of 6-mercaptopurine on resistant cells was also studied. The net gas production in these circumstances fell within the range for the controls. It is not, however, possible to draw any firm conclusions from this since the readings have a rather wide range around unity and so any effect of the drug would be difficult to detect.

While no support has been gained for the hypothesis that stimulated this investigation, two points of interest have emerged. First, a simple reproducible system for the investigation of the effect of 6-mercaptopurine upon sensitive *L*1210 cells has been found, and secondly, a profound difference in the respiratory behaviour of sensitive and 6-mercaptopurine-resistant *L*1210 cells has been observed.

This work was carried out during the tenure of a Leukæmia Society Fellowship. I am grateful to Mr. D. E. S. Truman for his help with manometry, and to Miss M. Barrett of the Wellcome Research Laboratories for sending me mice inoculated with *L*1210 cells. Messrs. Burroughs Wellcome kindly supplied the 6-mercaptopurine.

Electrophoretic Separation of Certain *In vitro* and *In vivo* Reactions of Rabbit Anti-Mouse Erythrocyte Serum

Rabbit anti-mouse-erythrocyte serum provided an excellent model for the study of *in vitro* and *in vivo* immunological reactions. In addition to its strongly hæmolytic and agglutinating properties for, and its combining ability with, mouse erythrocytes, this antiserum readily produces anæmia in mice, a species especially suitable for this purpose.

These reactions were studied as quantitatively as possible under comparable conditions: hæmolysin was measured in 50 per cent hæmolytic ($H/2$) units in a total volume of 2 ml. Approximately 5×10^7 erythrocytes were lysed by one $H/2$ unit of hæmolysin. Saline agglutinin was titrated by a 1·26-fold dilution system and recorded in scores (++++ = 10, +++ = 8, ++ = 5, + = 3, + *w* = 1). In this way, the end-points were spaced more closely and the strength of the serum was represented more precisely. The combining ability was detected by using unlabelled and fluorescein *iso*cyanate-labelled sheep anti-rabbit globulin serums. With the former, an indirect anti-globulin test was done and the agglutinating titres were recorded. The formalinized mouse erythrocytes were sensitized with the anti-mouse erythrocyte serum or its fractions. It was then coated with the fluorescent serum, washed, and examined microscopically with ultra-violet light. The brightness of the green fluorescence was recorded as − (negative), +, ++, +++, ++++ (positive).

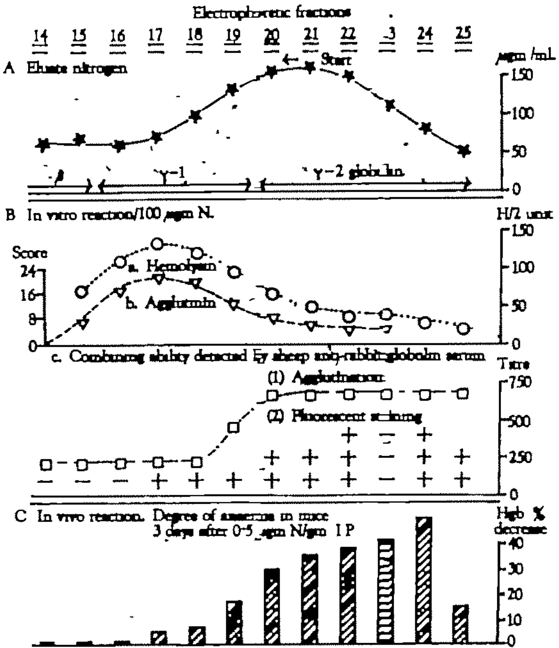

Fig. 1. Association of immunological reactions with electrophoretic fractions of rabbit anti-mouse erythrocyte serum

Groups of mice were injected intraperitoneally with 0·01 ml. of different dilutions of rabbit anti-mouse erythrocyte serum per gram of mouse. The potency of the serum was measured by the degree of anæmia at its maximum, which was usually 3 days after the injection. The degree of anæmia was expressed in terms of percentage hæmoglobin decrease, as compared with the pre-injection value. Hæmoglobin was determined with the cyan-methæmoglobin method using a red-cell-counting pipette to minimize the amount of blood required.

Rabbit anti-mouse erythrocyte serum was prepared by injecting rabbits intraperitoneally with 1 ml./kgm. of a 10 per cent suspension of thoroughly washed erythrocytes. Injections were repeated four times weekly in the first and third week. Antiserum was collected 7 days after the last injection. Fractionation of serum was accomplished by starch-zone electrophoresis[1]. At the end of each run the 50-cm. long starch block was divided evenly into 25 fractions. Buffered saline eluates from each fraction were adjusted to contain equal numbers of μgm. of protein nitrogen before their activity was tested. Similar results were observed with fractions of 5 antisera. An example is shown in Fig. 1 in which only the β- and γ-globulins (fractions 14 to 25) are listed. Samples from other fractions were also tested concurrently but found to be negative. The association of the various immunological reactions with the globulin fractions can be summarized as follows.

In *in vitro* studies, the hæmolysin and saline agglutinin were similarly distributed. Most of them were associated with the γ-1 globulin fractions. The combining ability as demonstrated by unlabelled and fluorescein-labelled sheep anti-rabbit globulin serums was associated mainly with γ-2 globulin fractions. These findings are essentially the same as those reported by the isotope-tracing technique in the rabbit anti-sheep erythrocyte system[2].

In *in vivo* experiments, the degree of anæmia in mice increased progressively from fractions 19 to 24

Solutions of the carboxy proteins equilibrated by dialysis against phosphate–sodium chloride buffer pH 8·0, ionic strength 0·35 (potassium dihydrogen phosphate 0·0044 M, disodium hydrogen phosphate 0·0652 M, sodium chloride 0·15 M), were studied in the Svedberg oil-turbine ultracentrifuge at 54,000 rev./min., the diagonal schlieren system being used for optical observation.

The mixture of hæmoglobin A and hæmoglobin 'Bart's' sedimented as a single symmetrical peak when examined at concentrations of 1·5 and 1·0 gm. protein/100 ml. At the latter concentration the sedimentation coefficient was $S_{20,w} = 4 \cdot 13\ S$. A solution of hæmoglobin 'Bart's' examined at 0·36 gm./100 ml. also sedimented as a single component, with $S_{20,w} = 4 \cdot 49\ S$. These values for the sedimentation coefficients are in excellent agreement with those obtained at corresponding concentrations of carboxyhæmoglobin A by Kegeles and Gutter[14]. From these observations it may be concluded that the molecular weight of hæmoglobin 'Bart's' is very close to that of hæmoglobin A, approximately 68,000.

By analogy with Jones *et al.*[11], who have named hæmoglobin H β_4, we suggest that hæmoglobin 'Bart's' should be referred to as γ_4.

Fœtal hæmoglobin ($\alpha_2\gamma_2$) is distinguished by a 'tryptophan notch' in the ultra-violet spectrum and by being more resistant to denaturation by alkali than adult hæmoglobin ($\alpha_2\beta_2$). Hæmoglobin γ_4 shares these properties to a different degree. Choremis, Zannos-Mariolea, Ager and Lehmann[15] produced a figure in which the absorption spectra of solutions of equal strength of $\alpha_2\gamma_2$ and γ_4 are compared, and it can be seen that for γ_4 the 'tryptophan notch' is about twice that of $\alpha_2\gamma_2$. The alkali resistance of γ_4 is, however, only about one half that of $\alpha_2\gamma_2$. A possible explanation is that the distinctive ultra-violet spectrum is due to chemical properties of the γ-chain, but that the alkali resistance is associated with the structural arrangement of the four chains in the hæmoglobin molecule. The combination of α- and γ-chains would then produce a less-accessible target for the denaturing agent than that of γ-chains by themselves.

RADIOBIOLOGY

Potentiation of Hair-Growth by Ultra-Violet Light

SINCE Findlay performed his pioneer experiments in 1928[1], much research has been carried out to investigate the carcinogenic action of ultra-violet light on skin.

Little work has been done, however, to establish the exact wave-length of light concerned in the production of tumours, and it was in the course of experiments designed to elucidate this problem that a growth-promoting effect of ultra-violet light on hair was observed.

The apparatus used in this work was the monochromator described by Magnus *et al.*[2], which employs a large quartz, water-filled prism for dispersion and a 2-kW. high-pressure xenon arc lamp (Osram *XBO* 2001) as light-source. Male mice of strain *A*, aged 2–3 months, were used in the experiments.

The hair was removed from the flanks of a mouse with Clukes small animal clippers, and the animal was placed in a jacket of 'Cellophane' secured with Spencer Wells forceps. The jacket had an opening cut in the side to correspond with the exit slit of the monochromator, and was held in a clamp with this opening opposite the exit slit.

A series of six mice was exposed to ultra-violet light of wave-length 2600 Å. for a period of four weeks, irradiated five days per week, daily dose: $2 \cdot 5 \times 10^7$ ergs. cm.$^{-2}$.

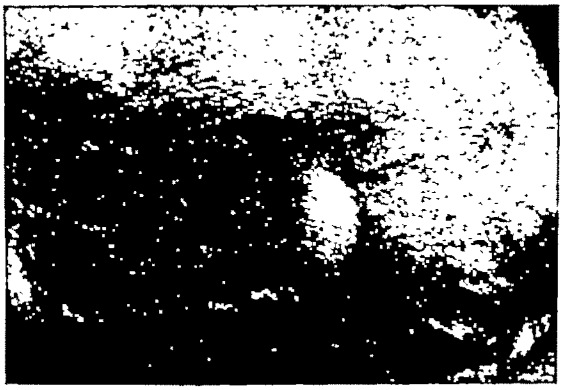

Fig. 1. Flank of mouse showing tuft of hair in irradiated patch

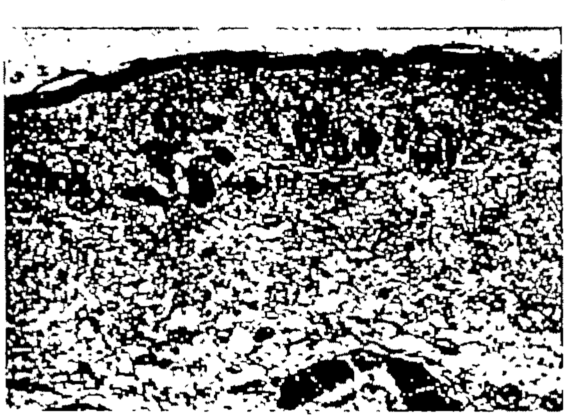

Fig. 2. Serial section from edge of the patch. Compare with the control

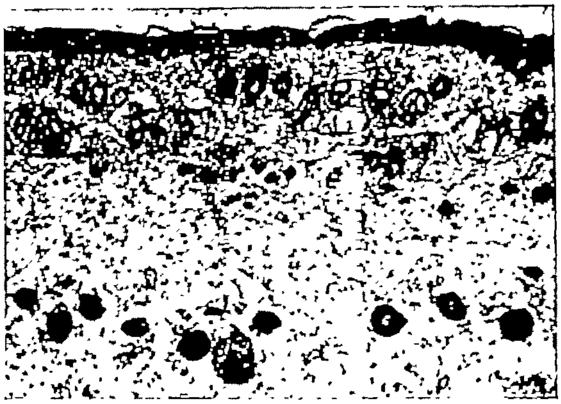

Fig. 3. Serial section from just inside the edge of the patch. The resting phase hair follicles are undisturbed, but activity can be observed in the dermis. The epidermis is characteristically thickened

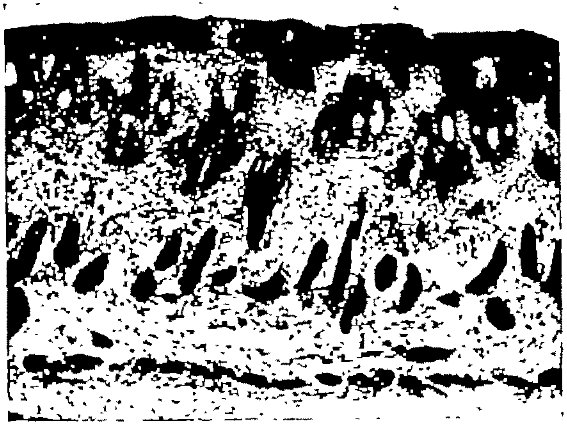

Fig. 4. Serial section from the centre of the patch. The active hair follicles are very evident, and the resting phase follicles are considerably disordered. The epidermis is extremely thickened in this region

In each specimen, a considerable potentiation of hair-growth was observed in the irradiated patch of skin.

As the hair growth-cycle was not at an identical stage in each specimen, the appearance of hair through the epidermis did not occur at the same time in each animal. There were, however, similar changes in the skin of each animal, and by the end of three weeks

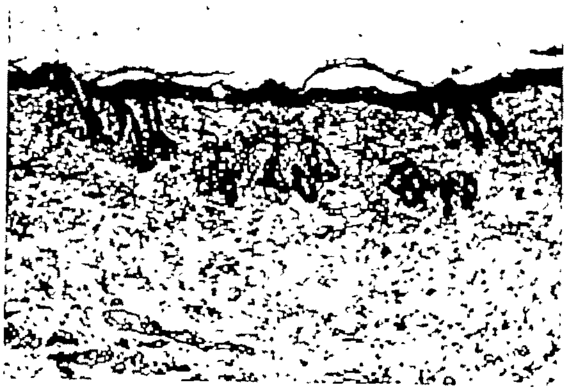

Fig. 5. Section from opposite flank as control. The hair growth-cycle is in its resting phase, the hair club and capsule lying in a position close to the epidermis, just below the level of the sebaceous gland duct

tempts might be made
tolerance of the embryonic graft to more antigens than those specific for its lethally irradiated host only, with the eventual aim of converting the homologous radiation chimæras into universal recipients of homologous tissues from any randomly selected individual of an antigenically heterogeneous population. The same principle could be used here as in the experiments of Hašek and Hašková[4] on polyvalent immunological tolerance in ducklings: to expose immunologically immature cells to the complete antigenic spectrum representing the given population. In the treatment of lethally irradiated mice, these conditions could be accomplished by means of pooled embryonic hæmatopoietic cells derived from a sufficiently great number of donors.

A preliminary experiment was made to estimate the suitable number of donors[5]. It was assumed that this number must exceed the minimal number of embryonic donors the pooled cells of which need to be administered to normal recipients to render them capable of developing a second-set reaction against a skin homograft from any donor selected at random. It was demonstrated that 40 embryonic donors are necessary to induce a 'universal' transplantation immunity by means of their pooled cells. With 50 embryonic donors, therefore, the experiments were started to induce a 'universal' immunological tolerance in homologous radiation chimæras.

Adult female mice of a random-bred strain *H* were used. All 65 control skin homografts carried out between randomly selected individuals of this population were rejected during 23 days with a mean survival-time of 10·7 days. Irradiated animals (900 r. X-rays ; 220 kV., 22 m.amp., half-value layer 1·2 mm. copper, 27 r./min. at 70 cm.) have been given intravenously 0·5 ml. of embryonic liver cell suspension containing 10^7 cells per mouse. The survivors were skin grafted approximately 2 months later with the results shown in Table 1.

From the results presented here, it seems to be evident that :

(1) Even if the skin grafts originate from the same individual or from the same inbred strain as the therapeutic dose of embryonic hæmatopoietic cells, a low proportion of them fails to survive, probably because of the recovering immunological capacity of the host.

(2) No grafts survive from donors other than those of the therapeutic dose of hæmatopoietic cells with the exception of cases when pooled embryonic cells from 50 donors were administered.

(3) The mean survival-time of the rejected grafts seems to be slightly prolonged in homologous radiation chimæras in comparison with that in non-irradiated recipients of the same population.

Table 1. EFFECT

PROCEDURE IN LETHALLY IRRADIATED RANDOM-BRED *H*-MICE ON THE RESULTS OF SKIN GRAFTING

Group	Donor c	iver cells	Donor of the skin graft	Successful grafts (intact after 2 months)	Mean survival-time of the rejected grafts (days)	
					In radiation chimæras	In control non-irradiated *H*-mice
1	Inbred	9-day old	*CBA*	17/20	17·0	9·7
			C 57 BL	0/5	12·0	9·2
2	Random old	8–19-day	*H*-donor of the embryonic liver cells (embryonic skin frozen with glycerol)	8/10	17·0	11·0
	Not poo donor	ryonic	Randomly selected adult *H*	0/8	15·3	10·7
3	Random old, po	.8–19-day r donors	Randomly selected adult *H*	5/9	17·0	10·7

(4) Immunological tolerance may be induced in he pooled embryonic inoculum leading to the ompatibility not only between graft and host but lso among the individual components of the graft tself. Immunological competition among pooled noculum of adult bone marrow cells seems to account or the failure in the attempt of Murray *et al.*[6] to nhance the transplantability in lethally irradiated abbits. This would be also in agreement with the inding of Billingham *et al.*[7] and Gorer[8].

(5) It might be useful to increase the number of mbryonic donors to more than 50. As the number f the donors is raised, the antigenic contribution rom each of them decreases on one hand, but on he other the probability increases of a given antigen occurring several times in the pool.

(6) With regard to antigenic heterogeneity, both he mouse population as described here and the duck opulation of Hašek and Hašková seem to resemble he wild population much more closely than the andom-bred rats used in experiments of Billingham nd Silvers[9]; the induction of a state of 'polyvalent' mmunological tolerance by means of a pool of mmunologically immature cells comprising the omplete antigenic spectrum of a wild population eed not, therefore, be beyond practical possibilities.

This work is part of a research contract with the International Atomic Energy Agency.

BIOLOGY

Mutations affecting the Density of Bacteriophage λ

IT has been shown by Weigle, Meselson and Paigen[1] that λ-phage particles able to transduce galactose markers have buoyant densities in caesium chloride which differ from that of the phage from which they were derived. The altered densities are transmitted to the offspring.

Weigle *et al.*[1] showed that spontaneous clear (*c*) mutants derived from λ reference[2] are not altered in density. They did find, however, that the phages liberated, after induction, by a certain strain of bacteria lysogenic for λ were denser than λ reference.

While studying the densities of the λ mutants used by Jacob and Wollman[3] and by Kaiser[2] we found phages of two other densities. The buoyant densities in caesium chloride of plaque-forming λ are given in Table 1.

Table 1

Phage	Buoyant density symbol	Buoyant density in CsCl (gm./cm.^{3})	Origin of the phages
λref	*B*0	1·508	Kaiser (ref. 2)
λdense	*B*1	1·512	Weigle *et al.* (ref. 1)
λco	*B*2	1·491	Jacob and Wollman (ref. 3)
λc *mi*	*B*2	1·491	and Kaiser (ref. 2)
λc *m*6	*B*2	1·491	
λ*h*	*B*3	1·504	Appleyard *et al.* (ref. 4)
λ*m*5	*B*3	1·504	Jacob and Wollman (ref. 3)

The densities were measured using the density of λ reference as density reference (see Weigle *et al.*[1]) in a Spinco analytical ultracentrifuge by the method of density gradient of Meselson, Stahl and Vinograd[5].

Phages of the density *B*2 were chosen for a detailed genetic study. These phages carrying the markers *c mi* or *c m*6 were crossed to λ reference (and later to λ*m*5) of density *B*0. The progeny phages of these crosses were analysed by density gradient centrifugation. The phages, suspended in caesium chloride solution in water, are placed in 'Lusteroid' tubes in the *SW* 39 swinging bucket rotor of a Spinco ultracentrifuge and spun for 16 hr. at 22,000 r.p.m. Then as described by Weigle *et al.*[1] the bottoms of the tubes are pierced and successive emerging drops are collected separately. The contents of each drop are later analysed for the number of phages and for the genetic markers these carry.

The results show that virtually all the progeny phages have the densities *B*0 and *B*2 of either of the parents (about 0·1 per cent of the progeny phage which seem to have an intermediate density are at present under study). All the phages of density *B*0 or *B*2 respectively transmit this density to their progeny regardless of the genetic markers they carry. Recombinant phages of density *B*2 when crossed with one another give progeny only of the density *B*2 (and this is true of recombinants of density *B*0 also). Density *B*2 thus behaves as a single genetic character. We shall call *b*2 this character and $b2^{+}$ its allele in λ reference. By comparing the relative frequencies of different genetic markers at the densities *B*0 and *B*2 respectively it is possible to locate *b*2 on the genetic map of λ. It is very near *m*5. In fact in a cross between λ*m*5 $b2^{-}$ and λ$m5^{-}$ *b*2 only about 0·01 per cent recombinants λ$m5^{+}b2^{+}$ and λ*m*5*b*2 are observed.

In a cross between *b*2 and $b2^{+}$ the phenotype *B*2 or $B2^{+}$ (or *B*0) respectively always corresponds to the genotype *b*2 or $b2^{+}$, that is, there is no phenotypic mixing.

The phages $b2^{+}$ are able to mutate to *b*2, but reverse mutations have not been looked for.

The phages *b*2 are different from $b2^{+}$ not only in density but also in their ability to form stable lysogens. In all the cases studied the decrease in density was always accompanied by loss in the ability to form stable lysogens. The marker *b*2 is perhaps identical to the marker *l* of Jacob and Wollman[3] which they located near *m*5 and which also prevents stable lysogenization.

The density *B*1 seems also to be determined by a locus *b*1, located in the *c* region of the genetic map of λ. The presence of *b*1 increases the density of λ without affecting its lysogenizing frequency.

We have been unable to study quantitatively the properties of the phages of density *B*3, for the phages

ound field; but the posi-
n the tissues can still be
case when using a con-
denser.

If the sub-stage condenser is now moved up and down, a whole range of contrasting illuminations is obtained from near dark-ground, through a spectral series of contrasting colours in both specimen and background, to white illumination when a stained preparation appears as seen under an ordinary light microscope. For photographic purposes the differential effect may be increased by the use of appropriate colour-filters.

The effects just described are not seen when a fresh sample of 'Thorotrast' is examined, but only after it has been incorporated into body tissues. These effects may also be observed, though in a lesser degree, when using a continuously variable phase-contrast microscope. Such instruments, however, are less common than standard phase-contrast equipment.

The method may also be used with advantage for the examination of living cells, stained, and unstained sections; especially it has been found useful for rapid preliminary inspection of such objects as tissue explants, cultures of protozoa and similar living objects. Finally, the method allows rapid change over to oil-immersion, with or without phase-contrast, since the ×95 stop remains centred throughout.

Ageing of Mitochondria

THE ability of ethylenediamine tetraacetic acid to stabilize mitochondria is well known[1–4]. The present work was concerned with the effect of ethylenediamine tetraacetic acid on mitochondria in 0·25 *M* sucrose during and after rigorous treatment either by pre-incubation with carbon tetrachloride or by standing at 22° C. and then at 0° C. for prolonged periods.

Christie and Judah[7] found that washed mitochondria isolated from liver homogenates which had been pre-incubated at 0° C. for 3–4 hr. with carbon tetrachloride oxidized certain substrates at very low rates. The oxidations affected were those catalysed by enzyme systems which require pyridine nucleotides for electron transport. Normal activities could be restored by the addition of co-factors containing the appropriate pyridine nucleotide.

In the present work 10 per cent w/v homogenates of rat liver were prepared at 0–1° C. in 0·25 *M* sucrose, and in 0·25 *M* sucrose + 0·001 *M* ethylenediamine tetraacetic acid. Carbon tetrachloride was added to a concentration of 0·03 *M*, and mixed with the homogenate by shaking. Mitochondria were isolated immediately from portions of the homogenates by differential centrifuging[8]. They were then re-suspended in 0·25 *M* sucrose to wash off residual carbon tetrachloride, re-centrifuged and re-suspended in 0·25 *M* sucrose. The remaining portions of the homogenates were shaken gently at 0–1° C. for 90 min. in contact with carbon tetrachloride; mitochondria were then isolated, washed and re-suspended in 0·25 *M* sucrose.

Mitochondria from homogenates treated with carbon tetrachloride for 90 min. were found to have lost much of their ability to oxidize citrate (Table 1). Normal rates of citrate oxidation were restored by adding 0·0005 *M* diphosphopyridine nucleotide, 0·00067 *M* glutathione and 0·04 nicotinamide to the

System: adenosine-5-monophosphate 0·001 M; magnesium sulphate 0·0067 M; potassium chloride 0·025 M; inorganic orthophosphate buffer, pH 7·4, 0·013 M; cytochrome *c* 0·00001 M; sodium citrate 0·01 M; 0·5 ml. 20 per cent (w/v fresh liver) mitochondria in 0·25 M sucrose; water to 3 ml. final volume; 0·1 ml. 20 per cent potassium hydroxide in centre well to absorb carbon dioxide; gas phase air; temperature 38° C.

reaction mixture. However, Table 1 shows that the presence of 0·001 M ethylenediamine tetraacetic acid in homogenates reduced considerably the fall in citrate oxidation.

Similarly, ethylenediamine tetraacetic acid was found to protect mitochondria in liver homogenates subjected to severe ageing at 22° C. and 0° C. In order to accelerate ageing, 10 per cent liver homogenates were stood for 30 min. at 22° C. during which time the homogenate temperature rose to 16·5° C., and then for a further 180 min. at 0–1° C. Table 1 shows that although such treatment in 0·25 M sucrose homogenates greatly impaired the ability of mitochondria to oxidize citrate, mitochondria from 0·25 M sucrose + 0·001 M ethylenediamine tetraacetic acid homogenates gave normal rates of oxidation. The protective effect of ethylenediamine tetraacetic acid was demonstrable whether or not additional ethylenediamine tetraacetic acid was added to the respiratory reaction mixture.

Surprisingly, the capacity of mitochondria, aged by either of the above ageing procedures, to oxidize citrate was maintained or restored by the addition of 0·001 M ethylenediamine tetraacetic acid only to the system used to measure citrate oxidation (Table 2).

Mitochondria aged by standing or by carbon tetrachloride lose the sensitivity of adenosine triphosphatase to activation by calcium ions and 2 : 4-dinitrophenol, and they become fully sensitive to activation by magnesium ions[9–13]. It has been implied that the change in adenosine triphosphatase response might be related in some way to the loss of mitochondrial pyridine nucleotides and the inactivation of dependent enzyme systems[11–13]. However, in the present work, the omission of magnesium from the respiratory medium and the addition of 0·01 M sodium fluoride, which removes further magnesium ions with or without the addition of 0·001 M adenosine triphosphate, did not prevent the fall in citrate oxidation rates subsequent to either ageing treatment. Siekevitz *et al.*[10] have shown that adenosine triphosphatase of aged mitochondria is activated largely by bound magnesium ions or by bound magnesium ions plus magnesium–ethylenediamine tetraacetic acid, and that the addition of 0·005 M ethylenediamine tetraacetic acid did not greatly inhibit the adenosine triphosphatase activity of fresh or aged mitochondria. Consequently the stabilizing effect of ethylenediamine tetraacetic acid against the loss of activity of pyridine nucleotide-dependent enzyme systems of aged mitochondria would appear to be by some mechanism other than inhibition of adenosine triphosphatase.

Table 2. EFFECT OF ETHYLENEDIAMINE TETRAACETIC ACID ON MITOCHONDRIA ISOLATED FROM AGED HOMOGENATES
Procedure: described in text. Results shown are the means of four experiments all of which gave good agreement for equivalent readings

Homogenate medium	Additions	Oxygen uptake (µl./30 min./0·6 mgm. enzyme nitrogen)		
		Time 0	Time 0 + 90 min.	Time 0 + 210 min.
Sucrose 0·25 M	None	88	60	33
Sucrose 0·25 M	EDTA 0·001 M	89	82	71
Sucrose 0·25 M + CCl_4 0·03 M	None	87	—	40
Sucrose 0·25 M + CCl_4 0·03 M	EDTA 0·001 M	93	—	79

System: as in Table 1.

It appears that prolonged standing in 0·25 M sucrose or pre-incubation with carbon tetrachloride does not lead to direct passive diffusion of pyridine nucleotides from mitochondria. Such treatment must, however, alter the mitochondria in such a way as to permit the operation of a secondary change occurring after the commencement of incubation at 38° C. in the respiratory medium and leading to the loss of pyridine nucleotides and inactivation of dependent enzyme systems. Ethylenediamine tetraacetic acid prevents this secondary change. It may also prevent the primary damage by these ageing procedures as it is unnecessary to add ethylenediamine tetraacetic acid to the respiratory medium in order to maintain normal rates of citrate oxidation by mitochondria aged in 0·25 M sucrose + 0·001 M ethylenediamine tetraacetic acid. However, it is possible that sufficient ethylenediamine tetraacetic acid is taken up by mitochondria during ageing to prevent an ethylenediamine tetraacetic acid-sensitive reaction from occurring when the isolated mitochondria are incubated.

Accumulation of calcium ions from the homogenate during ageing might lead to further damage when mitochondria are incubated at 38° C. and to the loss of pyridine nucleotides[14]. However measurement of the calcium content of trichloracetic acid extracts of mitochondria by the ethylenediamine tetraacetic acid–calcon method[15] showed that the concentration fell from 30–35 µgm. to 16–18 µgm./gm. wet liver during 5 hr. standing in a 0·25 M sucrose homogenate at 0–1° C. Therefore it is unlikely that the effect of ethylenediamine tetraacetic acid is associated with chelation of calcium ions.

Hunter *et al.*[16] have discussed the influence of various factors on the re-incorporation of dinitropyridine nucleotide into mitochondrial enzyme systems, and suggest that the effect of ethylenediamine tetraacetic acid is likely to be due to complexing with the mitochondrial membrane rather than to chelating metal ions. The results of the present work favour such an interpretation. Ethylenediamine tetraacetic acid would appear to prevent the loss of pyridine nucleotides from incubated, respiring, aged mitochondria either by acting at the mitochondrial membrane to maintain its semi-permeable character or by inhibiting the release of bound pyridine nucleotides from mitochondrial enzyme systems. It is possible that ethylenediamine tetraacetic acid exerts its influence by complexing with structural cations and altering the charge on the mitochondrial membrane or at the site of binding of pyridine nucleotides.

as at least 5 years. The
nations, and, using the
per year, the age of this
years. Since the whale
of its second year when

marked, it was probably 6 years of age when shot. So the indirect methods using baleen plate traces and ear plug laminations give estimates of age in good agreement with the known age.

The testes each weighed 1·0 kgm., which indicates[5] that this whale was sexually immature, and that puberty would probably have been attained at 7 years of age. This is above the age at which most male humpbacks have been estimated to reach puberty; but it is not an isolated example since, of 118 males (from the west coast of Australia) the ear plugs of which contained 12 laminations, 6 per cent were still sexually immature.

The body-length of this whale was recorded as 36 ft. 9 in., which is relatively short for a male of 6 years but within the range of lengths recorded for males of that age. In 164 males from Australian whaling stations estimated on the evidence from ear plugs to be 6 years old, the body-lengths ranged from 34 ft. 7 in. to 43 ft. 3 in. with a mean length of 39·11 ft., standard deviation 1·62 ft., and a standard error of mean 0·13 ft. It is therefore probable that this was a slow-growing individual relatively late in maturing.

The recovery of this mark is also of interest because it is the first recovery on the west coast of a mark fired into a whale on the east coast of Australia. This change of migration path followed the mingling during the summer of 1958–59 of some of the group V (130° E.–170° W.) with the group IV (70° E.–130° E.) population of humpback whales which I[4] have shown in the region of the Antarctic from 110° E. to 130° E.

Morphogenetics of *Micrasterias americana* in Clone Culture

Waris, Grönblad and I have studied the plasmatic basis of the morphological units in *Micrasterias* species and their dependence on the nuclear influence[1]. The names of the morphological units and the schematically drawn plasmatic axes are shown in Fig. 1. The form, as well as the number, of the morphological units may be altered by a change in environmental conditions and by a change in the relative nuclear influence.

The concept 'nuclear effect per cytoplasmic unit' is of importance when variation in the morphology of the cell is considered. The variation can be induced artificially in different cell types (anucleate, hypohaploid, haploid, hyperhaploid, subdiploid and diploid cell types; binucleate cells of different types, mononucleate double cells; uniradiate, triradiate and quadriradiate types). The degree of organization of the side lobes usually increases in parallel with an increase in nuclear quantity; but the polar lobe usually undergoes only slight modification.

Also the number of morphological units may increase with the nuclear quantity, whereupon

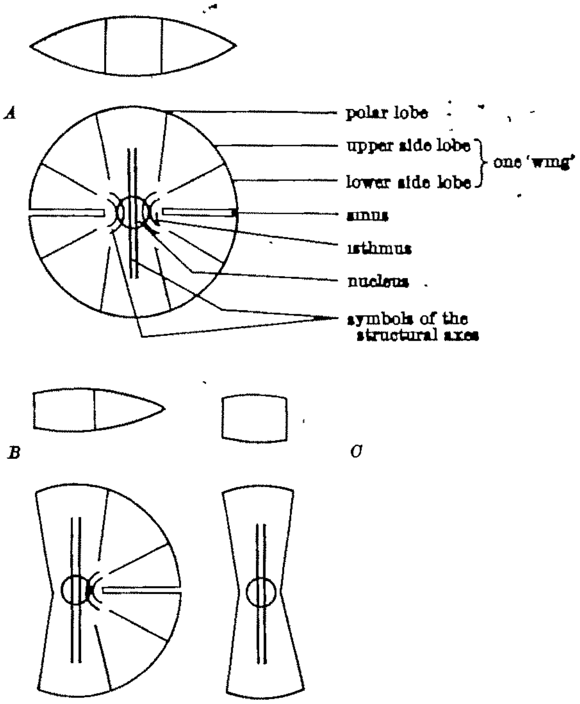

Fig. 1. Schematic drawings of different types of *Micrasterias*. *A*, Normal biradiate cell from the end and from the front; *B*, uniradiate cell; *C*, radiate cell

triradiate and quadriradiate forms are produced from the normal biradiate form. Such forms are found in Nature[3] and can be produced artificially from some *Micrasterias* species (*M. thomasiana*, *M. rotata*, *M. torreyi*, *M. angulosa*). The triradiate and quadriradiate forms of *Micrasterias* species are always diploid forms.

Since 1939 we have had under cultivation a clone of *Micrasterias thomasiana* var. *notata* which was produced spontaneously and in which one of the wings is absent from the cells. These cells are uniradiate forms. Since then, uniradiate forms of the species *M. torreyi*, *M. rotata* var. *evoluta*, *M. thomasiana* and *M. americana* have been discovered. An analogous form was also produced from *M. fimbriata*; but the clone died before it could be investigated in detail.

The significance of the nuclear effect per cytoplasmic unit is clearly seen in this haploid uniradiate cell. Morphological analysis has revealed that the existing morphological units in the uniradiate cell resemble the units in diploid cells in both size and form as a result of nearly equal ratio between nuclear quantity and cytoplasmic units in these two types of cells.

Because the number of cytoplasmic units was seen to increase with the nuclear quantity, the hypothesis was suggested that conversely a decrease in the nuclear influence (per cytoplasmic unit) may lead to the elimination of a cytoplasmic unit. This was later demonstrated in the case of *M. torreyi* double cells, which are cells that, owing to abnormal cytokinesis, contain the plasma of more than one haploid cell and a varying number of nuclei (one haploid, one diploid nucleus, or two haploid nuclei in different sites in the cell). These experiments revealed an effect of subnormal nuclear influence in accordance with the hypothesis, and clarified in principle the process by which uniradiate cells are produced.

A uniradiate cell may 'remutate' into a normal biradiate form. This is the same process that occurs when a biradiate cell becomes transformed into a triradiate cell by an increase in the number of side lobe units. The question then arose whether a cell with new side lobe units could be produced, and whether such a cell consisting of only polar lobe units is capable of existence. The method employed to produce the cell with no-side lobe unit was in principle the same as that used to produce uniradiate cells: some of the plasmatic units in double and other complex cells may lose their ability of reproduction, but the cell may still be capable of continuing its existence.

The organisms studied in the present investigation were uniradiate cells of *M. thomasiana* and *M. americana*. The desired result was obtained with the latter species. Numerous double cells of different types were produced in old cultures exposed to continued illumination. From one of such culture tubes with different types of abnormal cells, cells which lacked both side lobe units were produced spontaneously.

The new cell type, here called the aradiate type, is depicted in Fig. 2. This cell type scarcely resembles the genus *Micrasterias*. Perhaps the genus *Ichtyodontum* recently described by Scott and Prescott exhibits similar main features.

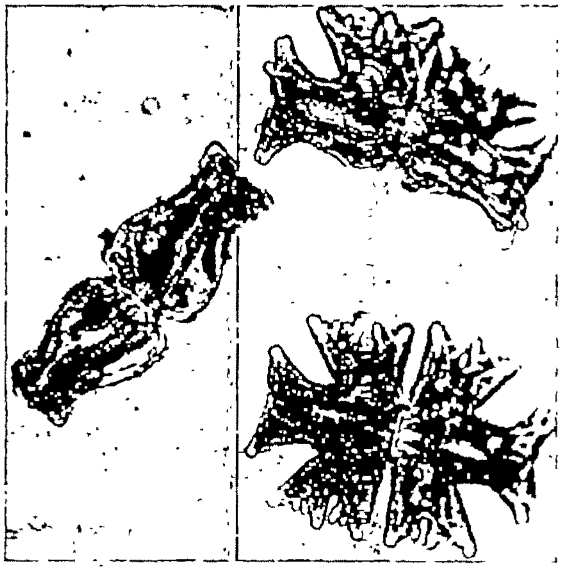

Fig. 2. *Micrasterias americana*. Biradiate, uniradiate and aradiate cell grown in the same culture tube

The aradiate *Micrasterias americana* cell thus has only one of the three morphological components of the normal biradiate *Micrasterias* cell. The following differences were noted when the aradiate cells were compared with normal *M. americana* cells growing in the same culture tube and hence under identical conditions. The aradiate cell is longer than the biradiate haploid cell. The apex of the former cell differs in form from that of the polar lobes of the latter in that the processes are always less well developed. When seen in end-view the cross-section of the aradiate cell is round except the apex which is usually irregular and sometimes forms an equilateral triangle.

The aradiate form has not been observed to undergo remutation to a uniradiate or biradiate form,

Nonanal as a Growth Factor for Wood-rotting Fungi

SOME years ago Suolahti[1] found that volatile substances evaporating from wood of various trees strongly promoted the growth of several wood-destroying Hymenomycetes. In particular, the development of aerial mycelium was favoured. The effect seemed to be correlated with the presence of oleic acid and other unsaturated fatty acids in the wood. The active substance or substances could not be identified.

Since nonanoic acid (pelargonic acid) and nonanal (pelargonic aldehyde) are known to be formed during autoxidation of oleic acid[2], it appeared desirable to test these two nine-carbon compounds for growth-promoting activity.

The compounds were administered to the fungi either through the liquid phase or through the gas phase. In both cases two media were tested: a synthetic mineral–salt–glucose medium (modified medium 3, ref. 3) and a water solution of 5 per cent malt extract. The following species of wood-destroying fungi were studied: *Stereum sanguinolentum* Fr., *Daedalea unicolor* Bull. ex Fr., *Polyporus cervinus* Pers. and *P. applanatus* Pers. ex Wallr.

In the first type of experiment, where water solutions of the substances to be tested were pipetted into the liquid nutrient medium, nonanal was found to produce a strong promotion of growth in *Stereum sanguinolentum* (Table 1), whereas the other species showed a weak or no response. Nonanoic acid had no effect in all cases. The response of *Stereum* was stronger in the synthetic medium than in the malt extract medium, and could already be observed after one day. In the latter medium the increase in weight seemed to be due mainly to the more abundant production of aerial hyphae in the flasks with nonanal.

Because of its volatility, nonanal rapidly disappears from the medium. Therefore, in prolonged experiments further addition of nonanal solution was made

Table 1. GROWTH OF *Stereum sanguinolentum* IN LIQUID CULTURE WITH AND WITHOUT NONANAL

Nutrient solution	Dry weight of mycelium (mgm. per flask)		
	After 19 days	After 25 days	After 30 days
Synthetic medium (control) D : o + nonanal	0·9 ± 0 5·9 ± 0·8	1·3 ± 0·1 9·3 ± 1·5	1·9 ± 0·2 12·7 ± 0·8
Malt extract (control) D : o + nonanal	32·0 ± 1·3 42·8 ± 1·2	38·7 ± 0·9 53·1 ± 2·1	42·7 ± 3·1 58·2 ± 1·6

Each culture flask originally contained 20 ml. nutrient solution. Every two days each control flask was supplemented with 1 ml. distilled water and each one of the other flasks with 1 ml. distilled water saturated with nonanal. Average values, ± standard errors, taken from four parallel cultures. Temperature, 25° C.

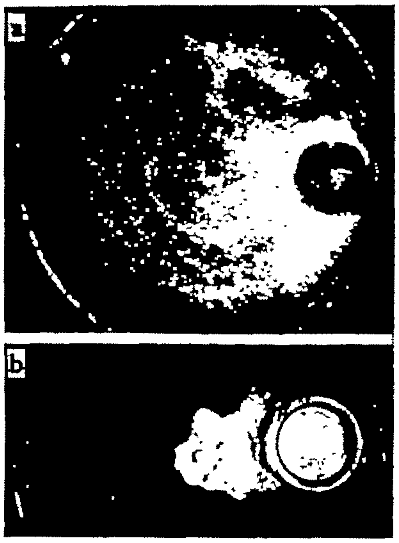

Fig. 1. Two cultures of fungi growing on the synthetic nutrient agar medium. To the right in the Petri dish the cup with a drop of 'Tween 40' containing 5 per cent nonanal (× ½). *a*, *Daedalea unicolor*, 8 days old culture; *b*, *Polyporus applanatus*, 9-day old culture

every two or three days. For these reasons the concentration of nonanal was never constant during the experiment. However, an original concentration of about 10 μmoles per litre, which means about 30 μgm. per flask, was sufficient to produce strong promotion of growth in *Stereum sanguinolentum*.

In the second type of experiment, where the substances to be tested were supplied through the gas phase, the fungi were grown in Petri dishes and the media were solidified with 1·5 per cent agar. The inoculum was placed in the centre of the agar plate. At the periphery, close to the glass wall, a small aluminium cup was introduced, containing the test substance dissolved in 'Tween 40' (polyoxyethylene sorbitan monopalmitate), a solvent which did not in itself affect the growth of the fungi under the conditions of the experiment. Solutions with 5 and 1 per cent (w/w) nonanal were used.

In these experiments the effect of nonanal was obvious in all species and in both tested concentrations, manifesting itself as an increase in the development of aerial mycelium and sometimes also as a faster growth of the substrate hyphae (Fig. 1*a*). The response of *Polyporus applanatus* was particularly drastic, a high and thick wall of interwoven air hyphae being formed around the cup containing the nonanal solution (Fig. 1*b*).

With *Stereum sanguinolentum* as test organism, the effect of a few other compounds chemically related to nonanal was studied in liquid culture experiments. Octanal and decanal produced a slight increase in the rate of growth, whereas nonanol and nonanoic acid proved to be completely inactive.

Preliminary experiments have shown that a number of other wood- or soil-inhabiting *Hymenomycetes* also respond positively to nonanal, for example, *Polyporus fomentarius* L. ex Fr., *Mycena metata* Fr., *M. adonis* Fr., *Coprinus narcoticus* Fr. and *Boletus variegatus* Sw. ex Fr.

The question whether Suolahti's wood factor is identical with nonanal, or not, must probably remain unanswered until the wood factor is isolated and analysed. At present it is also impossible to say anything with certainty about the biochemical mechanism behind the growth-promoting activity of nonanal. Earlier investigators have only observed inhibitory effects of this substance[4], except for one case of stimulation of spore germination[5]. Reports on the role of long-chain aldehydes in bacterial bioluminescence[6] and catalase activity[7] may indicate the possibility that nonanal functions in some way as an enzyme activator.

A more detailed report of the methods and results will be published elsewhere.

I am indebted to Prof. A. Fredga for the sample of nonanal.

BACTERIOLOGY

A New Species of Green Sulphur Bacteria

IN 1959 two strains of green bacteria were isolated in pure culture from mud of the Kujalnik estuary (near Odessa) and of Lake Sakaky (Crimea).

These strains are identical as to their characters, and in some features they differ from all other green sulphur bacteria studied in pure culture[1]. The micro-organisms isolated are motile, short, rod-shaped cells measuring about 1·0–1·5 × 0·8–0·9μ (Fig. 1). The suspension of cells has absorption maxima at 750 and 457 mμ. The purified green pigment of the bacterium has absorption maxima in ethyl ether at 660, 432 and 412 mμ. These maxima are typical of the chlorophyll of green bacteria[2,3].

Like other green bacteria, the isolated organisms require for their growth anaerobic conditions and light. Good growth is observed on a modified Larsen's medium[4] containing: 0·1 per cent ammonium chloride, 0·1 per cent potassium dihydrogen phosphate, 0·5 per cent magnesium chloride, 2 per cent sodium chloride, 0·1 per cent calcium chloride, 0·3–0·5 per cent sodium bicarbonate, 50 μgm./100 gm. iron (as ferric chloride), 0·1 per cent hydrated sodium sulphide ($Na_2S.9H_2O$) and a complex of trace ele-

bacteria utilize in their constructive processes both the carbon from added sodium bicarbonate and ethanol.

Examination of the organisms isolated leads us to include them in the family Chlorobacteriaceae. In their motility these bacteria are similar to *Chloropseudomonas* Czurda and Maresch[4].

In Bergey's "Manual"[5], *Chloropseudomonas* is included in the genus *Chlorobium*. But no known members of *Chlorobium* show any motility. For this reason it may be more logical to name the green bacteria described *Chloropseudomonas*. As the best development of these bacteria takes place on the medium containing ethanol, we propose as a specific designation *Chloropseudomonas ethylicum*.

Appearance of New Deficient Characters in Streptomycin-resistant Mutants of *Bacillus subtilis*

We have previously reported[1] that a new deficient character, uracil-dependence, appeared through a genetic interaction between two mutant cells of *Bacillus subtilis K*. It has lately been found, however, that the uracil-dependent progeny could be recovered among the colonies which appeared on a streptomycin-containing medium on which cells of a methionine- and histidine-dependent, and streptomycin-sensitive strain (*met,his,str-s*) had been plated[2]. Besides the uracil-dependence, some new characters, for example, histidine-dependence and thiamine- or niacin-dependence, appeared in other streptomycin-resistant mutants of *B. subtilis K*. These facts might have some connexion with the discovery of similar phenomenon in *Salmonella*[3] as well as with the mechanism of drug-resistance.

The first experiment was carried out with the *met, his,str-s* strain. About 5×10^8 cells harvested from a culture in nutrient broth were plated on nutrient agar and a synthetic medium (Gray and Tatum's medium plus methionine and histidine). Each medium contained streptomycin in the amounts shown in Fig. 1. It was found that smaller numbers of resistant colonies appeared on the nutrient agar than on the synthetic medium, and, moreover, the size of the colonies on media with low concentrations of streptomycin were generally smaller than those on media with higher concentrations. To test growth response, all the colonies which appeared on the nutrient agar were printed to the synthetic medium by the replica plating method. At a concentration of 5γ of streptomycin per ml., 8 out of about 10^3 colonies tested could not grow on the synthetic medium. At 10γ/ml., 5 out of 5, at 25γ/ml., 6 out of 9, and at 50γ/ml., 3 out of 3 could not. It was shown by the auxanographic technique that these irregular colonies required uracil for growth in addition to methionine

Table 1. VARIOUS STREPTOMYCIN-RESISTANT MUTANTS OF *B. subtilis K*

Mutant strains	Genotype	Frequencies	Types of Sm.-resistant	New type/Normal	Revertant

* An unknown factor. Sm., Streptomycin.

and histidine. Because the frequencies of new type appearance per total cells plated were almost equal regardless of the concentration of streptomycin, it is supposed that the *met,his,ura,str-r* mutant cells which had pre-existed in the mother culture of the tester strain were selected by this procedure.

Next, experiments were extended to the nine other biochemical mutants as well as the wild strain of *B. subtilis K* (Table 1). The third column in Table 1 shows the frequencies of recovery of resistant colonies at a concentration of 70–80 γ/ml. of streptomycin. The fourth indicates the type of new characters which appeared, and the fifth the ratio of new types among the resistant colonies obtained. In short, strain *A*11 gave one histidine-dependent, strain *A*1 two streptomycin-dependent colonies, strain *A*2 three streptomycin-dependent and two thiamine-or niacin-dependent. The wild strain gave only two colonies positive for streptomycin-dependence.

Finally, the relationships between the new dependent characters and streptomycin-resistance were examined. The spontaneous reversions of the new genetic characters gave no changes in streptomycin-resistance, and moreover the cross[4] between *T*17 (*try,thi,str-s* and phage-resistant) and the resulting methionine-, histidine-, uracil-dependent and streptomycin-resistant mutant produced the progeny, tryptophan-dependent and streptomycin-resistant and phage-sensitive, but not streptomycin-resistant and uracil-dependent. The results indicated that no close linkage relationship was observed between new deficient characters and streptomycin-resistance, and that each locus behaved independently in reverse mutation and genetic interactions.

GENETICS

Secondary Selection in Pure Lines of Rice

It is generally accepted in self-pollinated plants that once a pure line has been isolated no further improvement can be achieved by further selection within that line.

Ghose and Daiya[1] found the increase in yield of secondary selections from pure lines of rice (*Oryza sativa* L.) to be small. Experience in Malaya, however, indicates that a re-selection after a number of years from among populations in a pure line could give significant increases. The selection 'Siam 29' was distributed to farmers round about 1930. This selection eventually practically replaced all the unselected 'Siam' in all areas where this variety was planted. After the Second World War, it was observed that minor differences exist in the 'Siam 29' material collected from various places where this material was distributed. A re-selection was therefore carried out in 1949. Sub-strains isolated from this re-selection were found to be identical in morphological characters to that of 'Siam 29'. Some of these sub-strains have given significant yield increases over 'Siam 29', the control, in variety trials conducted over a three-year period. Results of one of the variety trials is given in Table 1 to show the increases of these sub-strains over 'Siam 29'.

Re-selection in two other varieties, the 'Nachin' and the 'Seraup Kechils', has given similar results. Re-selection in the 'Mayang Sabatils', however, gave very small and insignificant increases.

Since *O. sativa* L. is principally autogamous, and outcrossing is only of the order of 0·41 per cent[2], increases obtained by re-selection in pure lines, such

together could develop into seed. 'Nanay 32' has the alleles 2 and 4 on Knight and Rogers's terminology[2], allele 2 being dominant to allele 4. These four seedlings will thus be 2·4 or 4·4, any ovules which were 2·2 having failed.

Posnette[3], who demonstrated that pods could be set on a self-incompatible tree when both its own pollen and pollen from a self-compatible tree were applied to the same flower, suggested a similar method for determining if any of the seeds resulted from self-fertilization. He suggested pollinating a self-incompatible white-beaned tree with both its own pollen and pollen from a compatible tree homozygous for purple-bean, when any white beans obtained would result from self-pollination as the purple-bean characteristic is dominant. Van der Knaap[4] applied pollen from a compatible white-seeded tree to a self-incompatible tree heterozygous for purple and white beans together with its own pollen, and obtained an indication that some selfing was taking place from the lower proportions of white beans in the progenies than when the tree was only crossed. The present work is believed to be the first actually carried out in which it is possible to pick out the selfed seedlings.

Occurrence of a Brown Mutation in the Syrian Hamster

Cinnamon or 'brown' mutations in species of rodents are well-known modifications of the pigmentary physiology of the wild agouti colour. A comparable mutation is now recorded for the Syrian hamster, *Mesocricetus auratus*, one of the comparatively recent additions to the range of laboratory rodents. The mutant allele is inherited as a recessive to the normal gene and the genetic symbol *b* is proposed for its designation.

In the cinnamon hamster all the eumelanic pigmentation, which is normally black in the wild type, is now changed to brown. The overall effect is a cinnamon-orange of a particularly rich colour. This is due to the fact that the wild agouti Syrian hamster is considerably more auburn than the drab agouti of, say, the mouse or rabbit. The agouti brown mouse or rabbit is much brighter than the black agouti, and this brightening effect is greatly enhanced in the hamster, as a consequence of the initial auric pigmentation. The auburn colour is due to abundant phaeomelanin, which is possibly only indirectly affected by the brown mutation. The simplest assumption at present is that the brightening is due to an optical effect; although it is also possible that the modification of black eumelanin to brown could so shift the pigmentary processes that additional phaeomelanin is formed out of the chromogenic substrate.

The colour of the cinnamon hamster is a rich cinnamon-orange. The black flashes of the wild type are replaced by brown, as are also the black tips of the coat hairs and the shafts of the vibrissae. The dark blue undercolour of the coat is changed to a lighter hue. The pale cream colour of the undersurfaces (jaw, throat and stomach) of the animal are unchanged. The ear auricula are peach-grey instead of black. A most conspicuous alteration has occurred in the eye colour, where, by reflected light, the pupil glows a rich sanguine red. This feature is more pronounced than that found in cinnamon mutants of the mouse or rabbit. It would suggest a relatively severe reduction in the quantity of eumelanin present in the various eye tissues.

The eye colour of the cinnamon is a brighter red than that found in the genetically distinct ruby-eye dilute (*ruru*) hamster[1]. In this mutant type the eye colour, viewed by a reflected light, is a dull ruby red. The two mutants cannot be confused, for the ruby-eye animal has a diluted bluish-fawn coat. It is of interest that the gene combination *bbruru* exhibits the action of both mutant genes. The coat colour is a soft cinnamon-beige while the eye colour is a translucent red, lighter and distinctive from that of either the cinnamon or ruby-eye. It has also been observed that the *b* allele is hypostatic to the cream (*ee*) mutation[1], except for eye colour. The genotype *BBee* has cream-yellow fur colour, while the genotype *bbee* also has cream fur plus the red-eye colour associated with *b*.

The mutant allele was discovered in the United States during the early part of 1958 by a hamster fancier, and animals carrying the gene were imported into Britain in the early months of 1959. An imported male bred to normal females produced an F_1 of 100, all of which were wild type. The F_2 generation consisted of 148 ♂♂ *B*, 160 ♀♀ *B*, 44 ♂♂ *b* and 63 ♀♀ *b*. The observed segregation of cinnamon offspring is a good fit to a 3 : 1 ratio ($\chi_1^2 = 0{\cdot}14$; $P \simeq 0{\cdot}70$), and the sex ratio is a good approximation of equality ($\chi_1^2 = 2{\cdot}17$; $P > 0{\cdot}10$). A test for possible partial sex linkage in the segregation above was completely negative ($\chi_1^2 = 1{\cdot}63$; $P \simeq 0{\cdot}20$).

The evidence presented in the above paragraphs indicates that the cinnamon-orange phenotype of the Syrian hamster is inherited as a monogenic, autosomal, recessive character. It is suggested that the mutant allele is a probable homologue of the brown mutation known in several other species of rodents.

I wish to acknowledge the kind co-operation of Mrs. Margaret Beher in obtaining specimens of cinnamon hamsters.

PSYCHOLOGY

Experimental Evidence for Extra-Sensory Perception

SINCE making my reply (*Nature*, 185, 949) to Mr. C. E. M. Hansel's communication in *Nature* of November 7, 1959, I have examined the question in greater detail. The periodic segmental effect noted by Mr. Hansel is, I find, entirely restricted to the experiments done at the 'rapid rate' of calling; in the much larger group of 6,039 (+1) trials aimed at normal speed, the effect does not appear. As the reader may easily verify by means of Table XXXII of Appendix D (p. 139) of the original Shackleton report (*Soc. Psych. Research Proc.*, Part 167), there is no significant decline in the segments of the run and the corresponding graph shows an absence of any marked pattern. This provides a strong argument against the hypothesis that the guesser arranged his 'hits' so as to fall on certain pre-assigned positions in the scoring sheet.

Mr. Hansel suggested that an inspection of the positions of the (+2) hits on the scoring sheets concerned might throw light on the question. I therefore tabulated the hits in positions 1–23 for every column of the 'rapid rate' experiments. At first sight I was struck by the number of hits in a column which were spaced at a common interval. For example, column 7(*b*) on March 28 contained 11 hits in the positions 3, 4, 6, 7, 10, 11, 14, 18, 20, 21, 22. Of these, five are spaced at four trials apart, that is (6, 10, 14, 18, 22). But I discovered that such regularities can be obtained quite as frequently from a table of random numbers. I opened Tippett's table at page II, in which the random digits are arranged in columns of two-figure numbers.

Starting at the top of the first column and working down the succeeding columns in order, I constructed random positions in the column for a total of 10 hits as follows. Passing over the two-figure numbers 92–99 for obvious reasons, but retaining 00, each number was divided by 23 and the remainders noted. This was continued until 10 remainders were obtained which represented a random distribution of 10 (+2) hits in the first 23 places of the column, the remainder 0 standing for place No. 23. This process was continued until the first 47 sets of 10 hits were obtained. No gaps were left except those corresponding to the numbers 92–99, and of course the same remainder was not used more than once in a set of 10.

In the first 47 sets of 10 (+2) hits formed in this way, there were 17 with ⩾5 hits spaced at equal intervals.

For example, the first of these begins at II (1) 14, which means at the fourteenth entry down the first column of page II of Tippett's random numbers, and the seventeenth begins at II (14) 12.

There were also 16 sets of 10 each of which contained 4 hits spaced at equal intervals The first of these begins at II (2) 21 and the last at II (13) 48.

In the actual experiment there are 11 columns with scores ranging from 9 to 12 and so comparable with the control series, and these comprise 4 columns each with 5 hits equally spaced. These occur on March 21, 1941 Col. (6*b*), March 28, 1941 Col. (7*b*), March 28, 1941 Col. (8*b*) and April 18, 1941 Col. (7*a*).

A simple contingency table:

17	30	47
4	7	11
21	37	58

gives $\chi^2 = 0{\cdot}02$ with $0{\cdot}8 > P > 0{\cdot}7$, which is not abnormal, and this shows that regularly spaced hits occur quite as frequently in a random distribution as they do in the actual experiment.

The 11 columns of the actual experiment comprise 5 columns each with 4 hits equally spaced. These occur on March 21, 1941, Col. (6*a*), April 18, 1941, Col. (5*a*), May 22, 1942, Cols. (2*b*) and (3*b*), and June 5, 1942, Col. (1*b*).

Dr. Soal does not say how many experiments have been produced in which the results show a segmental salience effect, and I suspect that 'many' is certainly less than ten. Even if a high proportion of the experiments on extra-sensory perception have shown a segmental salience effect, I would not regard the suggestion that such effects are due to faulty experimental design as improbable.

Dr. Soal has himself revealed many weaknesses in the experimental work of other investigators in this sphere, and as I have pointed out elsewhere[1], I have been unable to find satisfactory evidence for extra-sensory perception in spite of many attempts to obtain it. If precognitive telepathy does not take place owing to processes not existing in Nature which permit its occurrence—as I consider to be the case—something must be responsible for the highly significant results obtained in some of the experiments and not in others. Whatever it is can be included in the general term 'experimental error'. While it is of interest to know what causes experimental error to arise, we must await a foolproof experimental design and a result which can be confirmed by other independent investigators before having to consider seriously the hypothesis of extra-sensory perception as an alternative explanation. The presence of a segmental salience effect must be taken in conjunction with the fact that there is a weakness in the experimental design which permits the result to arise by means of processes which are well understood, and that exploitation of this weakness without sufficient care would inevitably produce the salience effect.

Preliminary Psychomotor Stress Studies with Subnormal Psychopathic Subjects

IN a series of research studies concerned with stress reactivity in adult male patients of subnormal intelligence quotient (*I.Q.*) and of known delinquent or psychopathic history, it has been established that stability, and possibly prognosis, are related to behavioural and physiological measures of stress reactivity[1,2]. Stress reactivity has been regarded as a continuous single variable, and it seems that instability corresponds with very high or very low reactivity, and stability with moderate reactivity, findings which are similar to those of Lykken[3], for primary and neurotic sociopaths, and the views of Eysenck[4,5] and Franks[6,7], concerning introversion–extraversion and conditionability. In general, physiological measures, such as the conditioning-rate of the galvanic skin response, correlate more highly with various social criteria than do behavioural measures. This is for three reasons: (*a*) the physiological techniques reduce extraneous stimulus and response factors to a minimum; (*b*) the techniques are applicable to subjects of quite low *I.Q.*, for example, down to 60; (*c*) the responses usually indicate a required range of scores from unreactivity to high reactivity.

There is clearly much in common with this stress reactivity variable, Eysenck's continuum of varying excitatory/inhibitory balance and Davis's[8] continuum of inertia-overactivity, which was originally determined from flying personnel research. Techniques aimed to assess Davis's psychomotor variate carry fewer disadvantages than most behavioural measures of stress reactivity in that the intellectual requirements need not necessarily be high, and the response can be assessed along a continuum from unreactivity to high reactivity. Venables[9,10] designed such a technique to demonstrate psychomotor differences between dysthymics and hysterics, and also found a close relationship between the psychomotor response and autonomic reactions. Using the same technique, Anthony[11] found highly significant differences between the psychomotor responses of delinquents and non-delinquents among Air Force personnel, with indications that the variate carries a high predictive validity.

In view of this similarity in conclusion from the different research sources, and also in view of the possibility that the Davis–Venables–Anthony technique might be of practical use in a battery of stress reactivity tests designed to predict behaviour for subnormal psychopaths, a series of experiments was instigated. These were designed to determine: (*a*) the relationship this variate has to galvanic skin response conditioning score (stress reactivity); (*b*) the main constituent of the psychomotor stressor, that is, whether it is speed stress or load stress[12] or both; (*c*) the modifications necessary to make the technique more practicable for low *I.Q.* subjects.

The original test required the subject to move a lever to the left or to the right, and back to the original position, in response to signal lights which flashed on a display panel at regular intervals. The lever operated a pen writing on moving paper, which recorded the amplitude of the subject's response (R), and the time taken (W), giving a third index R/W or speed. The test was in three consecutive parts, namely, series A, simple stimulus conditions at a moderate rate of presentation; series B, complex stimulus conditions at a higher rate of presentation, and C, identical to series A. Both Venables and Anthony found that the indices most highly associated with psychiatric or social criteria were: (*a*) the general score-level for speed, R/W, under all stimulus conditions; (*b*) the difference in speed under conditions B and C; (*c*) the direction of change, that is, increase or decrease in speed.

For practical purposes, and in order to overcome the time-consuming measurement of 150 individual responses for each patient, modified apparatus was designed and constructed with the aid of money made available by the Mental Health Research Fund. As in the previous experiments by Venables and Anthony, the subject is required to move a lever from a centre position to the right or to the left in response to visual signals on a display panel. With the new technique the lever is arranged to activate a 10 counts/sec. electronic pulse clock on being moved off centre. An electromagnetic counter driven by the clock indicates the integrated time variate (W). To the lever is also attached a series of gear wheels and ratchets allowing its total integrated movement (the amplitude of the response, R), to be read directly from a revolving scale. Stimulus presentation has been automatized by using a pulsed uniselector so that the whole test, involving 150 stimulus-response pairings and calibration, occupies 7–10 min.

Five experimental trials have been carried out with different groups of 20 patients of *I.Q.* range 60–90, and one trial with normal male adults. Trial 1 followed the Venables–Anthony stimulus presentation procedure in respect of both speed stress (time interval between stimuli) and load stress (the complexity of the stimuli), and was found to be beyond the capabilities of too many patients. Trial 2 used the load stress but left the presentation-rate constant at a moderate level for series A, B and C. No significant correlation coefficients were found between any psychomotor variate and conditioning score. Trial 3 investigated the practice effect by presenting series A conditions three times in succession and comparing the resultant scores with those for trial 2. No significant differences were found, and it was concluded that the load stress, on its own, is unimportant in producing significant behaviour for these patients, with this test. In view of this, the subsequent experiments investigated the rate of presentation factor in relation to galvanic skin response conditioning with load conditions uniform for series A, B and C. No significant correlation coefficients were found for trial 4, when the rate of presentation was increased from 30 signals a minute in Series A and C to 50 signals a minute in series B. In trial 5, the rate of presentation was further increased to 60 signals a minute in series B, and this was found to produce a psychomotor stress reaction which correlated slightly with the conditioning score for the galvanic skin response. The measure used was the variate R/W, or speed, for series B, and the difference in R/W between series B and C. Assessed against galvanic skin response conditioning score, $\chi^2 = 3 \cdot 6$ and $3 \cdot 4$ respectively, $P = 0 \cdot 05$. The normal subjects were tried at a presentation-rate of 50 signals a minute, but R/W scores did not differ significantly from those of the patients under the same conditions.

No firm conclusions are possible at this stage; but the indications are that Anthony's finding concerning psychomotor stress in relation to relatively mild delinquent instability, can be associated with the general concepts of stress reactivity applied in the laboratory assessment of more severe psychopathic instability. The automatized technique has considerable practical appeal, but it seems necessary to concentrate more upon the rate of stimulus presentation stressor than the stimulus load stressor, and judicious experimentation with the former may provide valuable information.

ASHLEY MONTAGU

ment carried out and
agu are certainly most interesting; but they cannot be considered as providing a possible explanation of the unusual thickness of the Piltdown cranial bones, for two reasons: (1) Chemical analyses have confirmed that the Piltdown cranial bones are slightly mineralized (for example, they contain 0·1 per cent adsorbed fluorine); indeed the conclusion that they are sub-fossil has recently been confirmed by radiocarbon dating[1]. Sub-fossil bones which have lost a considerable proportion of their collagen matrix obviously will not be expanded appreciably by any chemical treatment—or at least not to an extent anywhere nearly comparable with that occurring in the case of a dissecting-room specimen with full collagen content. (2) The striking uniformity and small size of the diploic spaces in the Piltdown cranial bones are incompatible with any artificial expansion.

In the British Museum collections here there are other crania with walls not only as thick as those of the Piltdown cranium, but also showing the same combination of naturally thickened diploe and extremely thin inner and outer tables. The two most striking examples are the cranium of an Ona Indian from Tierra del Fuego, which has already been figured in comparison with Piltdown[2], and a Bronze Age skull from Sutton Courtenay in Berkshire (Oxf. *E*.118. 227).

MISCELLANY

The Serengeti National Park

THE interesting article on this subject by Dr. A. S. Thomas in *Nature* of May 21, p. 605, seems to call for the following comments:

(1) The new northern extension of the Park ('fly-bush' country without human inhabitants) was not added for the sake of antelopes, but because it was reported to be rich in elephant and rhinoceros.

(2) The southern boundary of the Park was, in the west, pushed outwards practically to the edge of present cultivation; the overspill of the ungulate migration to the south-east falls largely in the Conservation Unit under Government administration or in areas to some extent controlled with regard to 'game'.

(3) It is known, at least in respect of some types of ground, what may be expected to happen when pastoral activity is eliminated; large parts of the Park were already free from this. Moreover, in what is now the Conservation Unit (Ngorongoro) wild animals and domestic herds will continue to co-exist.

(4) The withdrawal of the Park boundaries from an area where human utilization could not be eliminated, that is, the Conservation Unit, was recommended mainly because experience has shown that dual control by Trustees and Government is unsatisfactory; and only where there is no human occupation can Government allow park trustees a clear field. In the Conservation Unit the Government has an opportunity of demonstrating what can be done in the way of reconciling conservational and pastoral interests—an experiment of great interest, on lines such as Dr. Thomas suggests.

LANDSBOROUGH THOMSON

Zoological Society of London.

FORTHCOMING EVENTS

Wednesday, July 13

Royal Institute of Chemistry, London Section (at Shell-Mex House, Strand, London, W.C.2), at 6.30 p.m.—Special General Meeting.

Friday, July 15—Friday, July 22

Sixth Commonwealth Mycological Conference (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W.C.1).

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Georgina McRobert Research Fellow (with histological training and preferably some experience in immunological methods), to collaborate in the immunopathological research programme being carried out in the Departments of Pathology, Bacteriology and Biological Chemistry—The Secretary, The University, Aberdeen (July 14).

Head (graduate, with good industrial and teaching experience) of the Engineering Department (Civil, Electrical and Mechanical Engineering)—The Principal, Dudley and Staffordshire Technical College, Dudley (July 15).

Research Fellow in Pure Science—The Secretary, Durham Colleges in the University of Durham, 38 North Bailey, Durham (July 15).

Lecturer in Chemistry, and a Lecturer in Chemical Engineering at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (July 15).

Assistant, Grade B (graduate in mathematics, science or engineering or with equivalent qualifications, and capable of teaching the subject up to H.N.C. and G.C.E. Ordinary standard) in Mathematics—The Principal, Derby and District College of Technology, Kedleston Road, Derby (July 16).

Assistant Lecturer (with a special interest in the general field of invertebrate palaeontology) in Palaeontology—The Secretary, University College, Gower Street, London, W.C.1 (July 16).

Chemist (Assistant Experimental Officer grade) in the Pedology Department—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (July 16).
